What do the colleges do for surgery and medicine, for law, for theology or for engineering? They simply afford convenient opportunities for the bringing together of teacher, student and illustrative material. They *make* neither doctors, lawyers, preachers nor engineers If the student have within him the material out of which one of these may be made, then the college will cultivate and systematize this material; but after the college has done for him all that it can do it has only brought him to the gateway of his profession. It is only when he passes beyond college walls and engages in the actual pursuit of his profession that he becomes a doctor lawyer, preacher or engineer. And how often does he fail, after the college has done its best for him!

The "folly, implied if not expressly stated in the terms of the Morrill Land Grant Act," is precisely the same folly that is implied or stated in the terms of every college charter. [Professor Porter wrote "fallacy" in place of folly. EDS. R. N.-Y.] When the professional colleges turn out none but fully equipped and successful professional men, then, and not till then, shall we have a right to demand that the agricultural colleges graduate only fully equipped and successful farmers.

That the so-called agricultural colleges, as a class, have most lamentably failed to accomplish their legitimate work none will insist more strenuously than I. It *is* true that "as at present managed, their influence is to take young men away from the farm." But this is true only of the class, and not of all the individuals. There are agricultural colleges whose managers have had the breadth of vision to see the opportunity that lay before them, and who have built up institutions wherein the spirit of agriculture prevails, and whence young men and women are going back to the farm with every faculty cultivated in sympathy with the life of the farm and trained to make the most of that life. These colleges do not *make* farmers; but give them the material out of which a farmer may be made, and they will not pervert that material into the making of a second-rate lawyer, doctor or preacher.

The trouble with our agricultural colleges lies here:

1. Their managers are generally men who have no active sympathy with the life of the farm; who were educated in the traditions of the "classical" schools, and who have not the wisdom to see that such education is now obsolete, so far as the training of men for modern life is concerned. These men have already been generally successful in turning "the agricultural colleges into schools of general culture, assimilating their courses of study largely to the courses in regular colleges."

2. The farmers, realizing that the old scholastic education was not adapted to their necessities, and seeing in the new education simply an old acquaintance under a new garb, have largely refused to patronize the colleges; whereas they should, by power of numbers and combination, have compelled a regeneration of these colleges in fact as well as in name.

Get the agricultural colleges out of the ruts of scholasticism, man them with men awake to and in harmony with the demands of the age, and we shall soon cease to hear of their failure.

Columbus, Ohio.

FROM DR. W. J. BEAL.

I have read a long article in a recent number of the RURAL, by Professor D. G. Porter, under the caption, "What are the Agricultural Colleges good for?" which is a question of great interest to many of us. If he had drawn more largely on facts and less on his imagination, the article would have contained fewer objectionable points.

Here are a few thoughts called out by reading his article, with no attempt to notice much that it contains.

He proves (?) that a man will be no more successful as a farmer by having a knowledge of veterinary surgery, agricultural chemistry, entomology and botany. Much depends on who teaches the above subjects, how they are taught and what parts are made prominent.

He says farmers can get needed information from reports of experiment stations and agricultural papers, not understanding that it is possible for stations and papers to be of much real value to the farmer only if we have well-educated men to manage them. The agricultural colleges have done more to raise the standing of agriculture and agricultural papers than most people are aware of, and they have made it possible to establish and maintain the experiment stations.

The agricultural colleges, the experiment stations and the agricultural papers constitute a natural alliance, each aiding the others.

The author admits that the studies referred to tend to make a person "a good deal more of a man." The leading thought of our best agricultural teachers is to make better and broader men while they are also training them for the farm In fact, the man is of more importance than the farm, and we cannot count a man as a successful farmer unless he is a success as a man.

The author plans, in a general way, a course of study, making the sweeping assertion that agricultural colleges take young men away from the farm. In several notable cases this last statement has again and again been shown to be untrue.

He refers to the 300 graduates of Massachusetts Agricultural College, where less than one-quarter have devoted themselves to agriculture in any of its branches. Let him count up a like number (as others have done) who graduate in other colleges or who take anything near a full course in academy or high school, and he will see that even the proportion of one-fourth of the graduates as farmers, in a manufacturing State like Massachusetts, is a fine showing for a young institution. If this be not enough, let him count up 300 graduates, taking all in certain classes, from schools of law and medicine, and see if he can make as good a showing for these professional schools.

"Now it is a fair presumption that most of the young men intend to become farmers; else why should they go to an agricultural college?" An experience of nearly 20 years in an agricultural college situated in an agricultural country, has shown that students are induced to drift into an agricultural college for a large number of reasons, as they drift into other schools or colleges.

In regard to the graduates of the Massachusetts Agricultural College, I take the following from Agricultural Science for April, 1889: The editor is a graduate of that college.

"Of the graduates of the college, 46 are farmers, six fruit growers and market gardeners, eight florists and landscape gardeners, four planters, nine poultry and stock raisers, seven veterinarians, two editors of agricultural papers, four fertilizer manufacturers, nine chemists to fertilizer companies and 28 engaged in agricultural colleges or experiment stations. There are 150 other graduates engaged in various occupations." The above is a fine showing for any agricultural college.

Professor Porter would turn the agricultural college into an academy, where instruction should be imparted only in winter. He greatly underestimates the cost of this method, when he states that for four to six months the cost would be not more than a quarter as much as it would be if the usual method were followed.

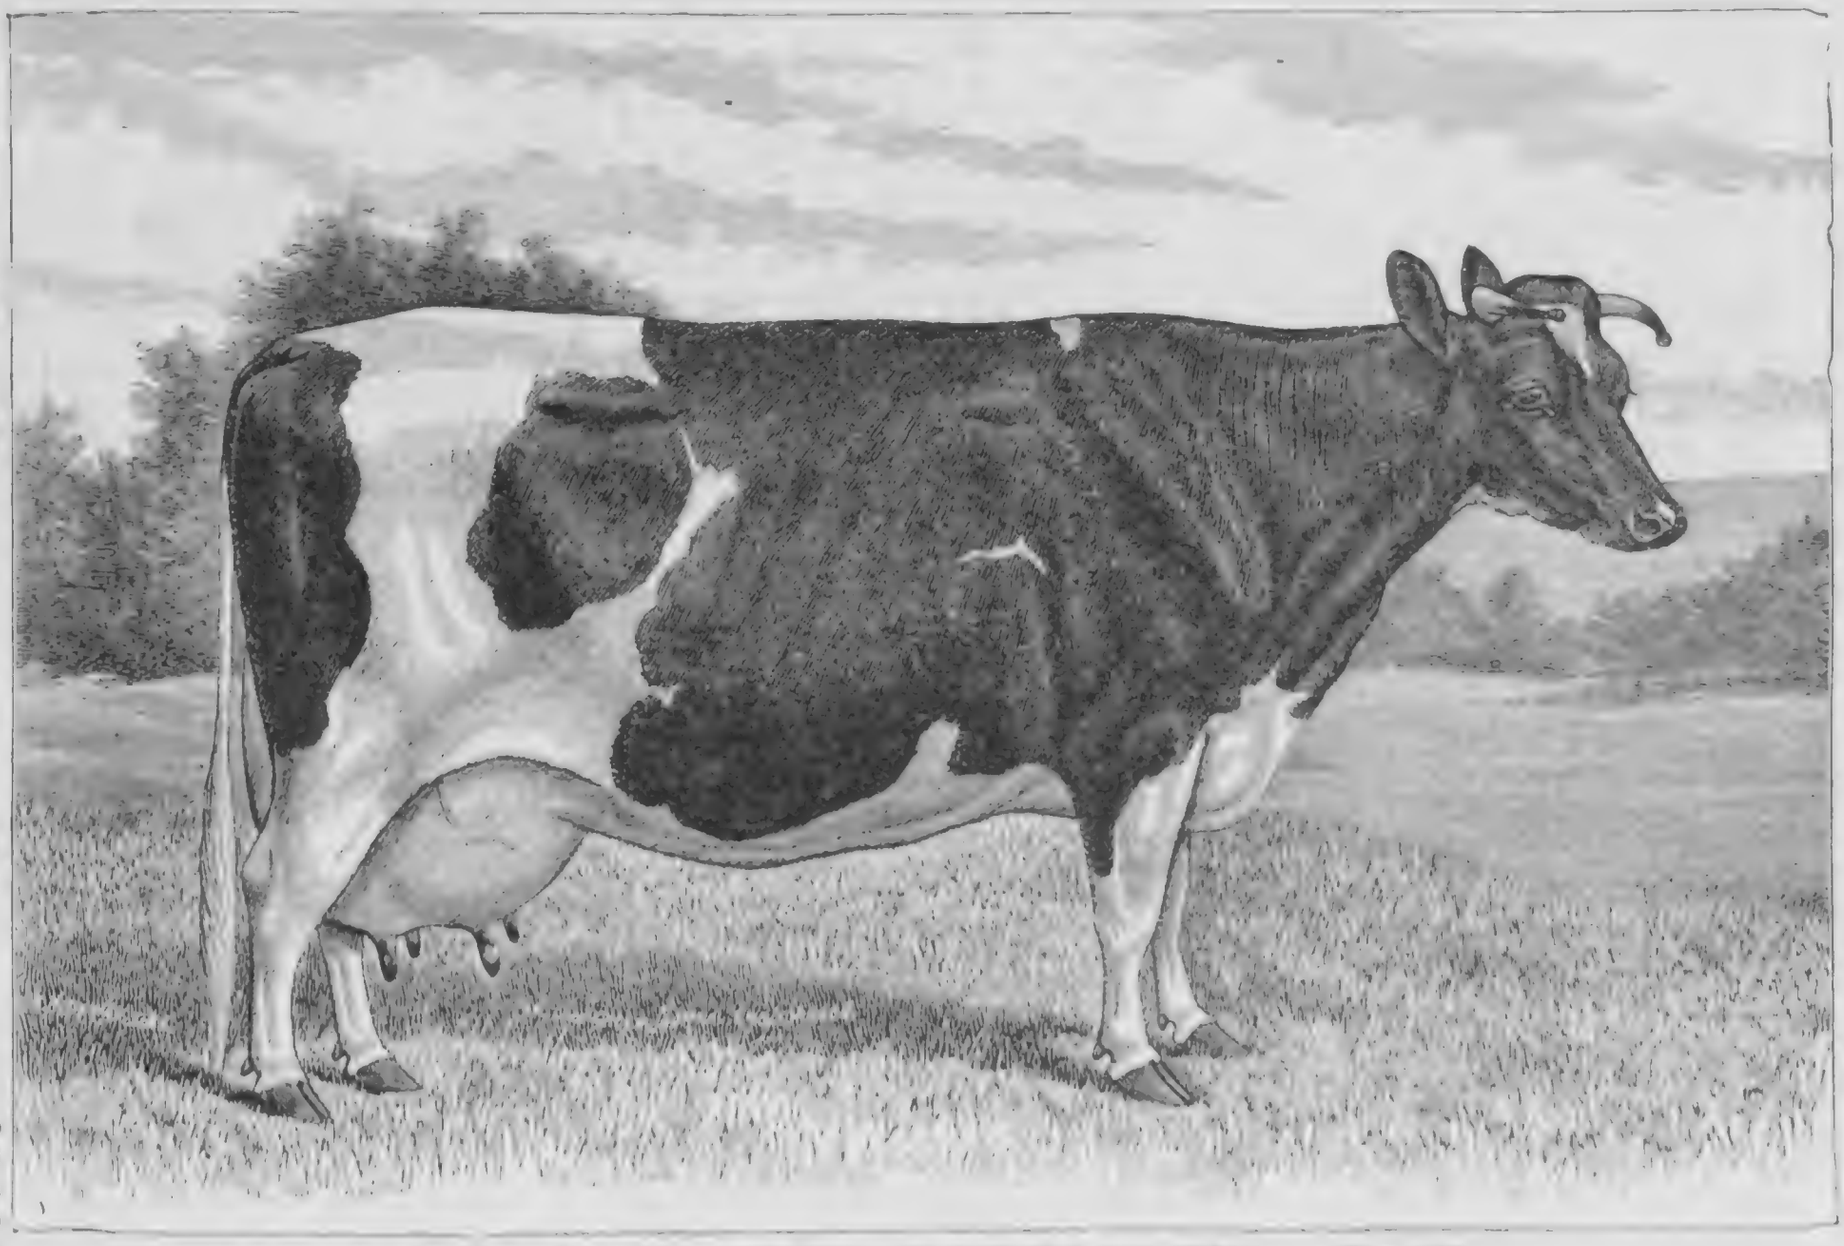
Our experience is like that in many other States, that poor boys can best support themselves while attending an agricultural college, by having the long vacation come in winter when the student can make more money in four months by teaching school than he could in six months by working on the farm. By taking a course of the college during summer, he has practice in many kinds of work requiring skill. Without a course followed by examinations and credits, experience would show that most boys would prefer base ball and other sports to taking notes of farm operations according to the plan of Professor Porter. Actual practice would show that very little could be done by one lecture a day, after dinner or before supper. Fortunately for our great nation with its varied interests, we are still trying many experiments in the way of teaching agriculture. By short courses, by those of four years, by summer courses, by winter courses, by establishing colleges in connection with universities, and by others not so connected, by requiring manual labor and by not requiring it, by introducing into a course a pretty liberal number of studies like rhetoric, pure mathematics, logic and moral philosophy, and by other courses in which these and kindred studies receive very little attention; in due time the problem will be solved.

There is one point the author has not taken into consideration, the fact that most of our graduates have little or no money when their course is finished. To become a farmer requires capital. Such men usually believe they can engage for a time in surveying, teaching or something else and get money more rapidly than by hiring out to work as a day laborer, or by going to a very new country where land is cheap. Many not now numbered among the farmers, still hope some day to be able to purchase and manage a farm.

Michigan Agricultural College.

FROM PROF. J. L. BUDD.

Prof. Porter's paper on page 348 of the



"RHODA," TYPICAL "GENERAL-PURPOSE" HOLSTEIN. Fig. 150.

RURAL is a surprise. His argument appears to be founded on the belief that the farmer, fruit grower, gardener and forester need only expertness of hand and a few empirical rules, handed down from father to son, to insure success. He says "plants will grow whether we understand the method of their growth or not," and, again, when trying to solve the problem as to what shall be done with existing colleges of this character, he says: "No study should be required, and no recitations be heard. The sole literary exercise should be one lecture a day devoted by the Professor to an explanation of the reasons and principles of what is then going forward in the department under his charge." As he says nothing of preliminary preparation in the natural sciences, or the needed academic studies, it seems fair to assume it as his belief that the farmer should go back to the position he was in mentally during the period he speaks of when "agriculture existed and flourished thousands of years before agricultural colleges were thought of."

If this be his meaning, I cannot see, after 13 years of experience with agricultural college classes, how the Professor can explain "the reasons and principles of what is then going on in his department." At the agricultural colleges of Europe of the first grade it is well known that the applicant for entrance must have completed the course of study embraced in the first seven classes of a gymnasium, or the first five classes in a real school, or have completed the entire course in an agricultural school of the second grade. With this preparation his two years' course has continued lectures, studies and recitations in applied science, combined with daily practice. At our best agricultural schools of the West—such as those of Michigan, Iowa and Kansas—the course of study and practice is not materially different except that a part of the preliminary studies is included in the regular course.

That such an education is not needed to grow a crop of corn or potatoes in accordance with a few empirical rules handed down from father to son may be freely admitted; but the real query is: could the common uneducated laborer have originated the new modes and methods, the new tools and appliances, the new and valuable varieties, the new and improved stock, and, in a word, the new order of things which has made our day the most advanced one in the industries the world has known? Would agriculture have kept pace with the advances in other lines without the aid of the agricultural colleges and trial stations of Europe and America? Here we have the true mission of the technical schools. We need the pioneers, the thinkers, the planners, and we will not find them among the students of the training schools the Professor is inclined to recommend.

As to the complaint that too small a per cent. of the students of such schools return to the farm, it should be noted that but few of them have farms to return to, or means to purchase and stock them. At first they drift quite largely to other lines of work that promise to pay better without invested capital. But personal observation of hundreds of such students who have left our college during the past 12 years shows that the bias towards agriculture, horticulture, forestry, veterinary science, mechanics, etc., during the formative period of their lives, leads them sooner or later to do good work as planners, leaders and thinkers, in the great and needed work of lifting up and bettering the industrial pursuits.

Agricultural College, Ames, Ia.

FROM AN AGRICULTURAL COLLEGE GRADUATE.

It does not seem to me possible that Professor Porter can ever have personally examined the workings of an agricultural college, talked with the graduates of such institutions or taken pains to see why boys want to enter them. As I am a graduate of an agricultural college, it may not be out of place for me to state why I took a course in agriculture and what influence such a course had upon me. I went to college of my own free will. I was considerably over age when I entered and I was obliged to depend upon my own efforts for support. I am sure I examined the catalogues of at least 100 different colleges before I decided to go to an agricultural college. I have never been sorry I went there, and if I had a boy to day to be educated I know of no other institution that I would sooner have him attend. My desire was to attend the college that would give me a sensible insight into what the world calls "an education" at the least outlay of cash, and at the same time leave me at the completion of my course in a condition that would enable me to do something in the way of earning my livelihood as soon as I graduated. I knew plenty of graduates of literary schools who for a year or more after graduation were utterly unable to support themselves by any other occupation than that of teaching, and I knew well enough that I never could succeed as a teacher. The agricultural college graduates that I knew were earnest, practical men. A demonstration of their ability and readiness to work hard in the field whenever called upon to do so and their equally evident ability to talk, think and act strongly and sensibly did much to send me to the Michigan Agricultural College.

During my college course I did rather more work on the farm than the average student performed. I milked cows the first year and in fact, went through the regular course of work, from spreading manure and digging potatoes to helping fill the silo or running the college engine. At the same time I had my full share of class and literary honors which were always elective—presented by the students.

I speak of this to show that the college spirit was essentially democratic; there was no such thing as a college aristocracy. Dudes and drones seldom went past the first term. Every boy had a square and equal chance for the college offices that college boys aspire to. I am positive that the vast majority of my college mates came to the agricultural college because they found that they could partly pay their way by working on the farm and because the graduates with whom they were acquainted were earnest and practical men—workers not dreamers.

My college expense account will show that I finished my course for less money than I should have been obliged to pay for two years at any reliable literary, or technical school. In fact, had it not been for the peculiar advantages offered by the agricultural college I never could have started my college education, and it is not at all surprising to me to find that the great majority of the boys at college with me say the same thing.

A word about the course of instruction at an agricultural college. If Professor Porter had ever gone to such a college and fairly investigated the methods of teaching and the matter taught, his article would never have been written. He proposes to have farmers depend entirely upon agricultural papers and experiment station bulletins for scientific information and investigation! Did it ever occur to him that the course at an agricultural college may be such that a farmer who takes it may be far better fitted to appreciate the science he finds in agricultural papers and bulletins? My experience is that a course in agriculture is a great help in understanding and practicing the principles laid down in modern agricultural literature. I should say that Professor Porter guesses at the matter.

And then that old humbug about the small proportion of agricultural students that go back to the farm! How many graduates of a Normal school do nothing but teach? How about graduates of schools of law or medicine? For a number of years after graduation I had less to do with agriculture than pleased me, simply because I had no farm to work. I can say most emphatically that I cannot think of a single member of my class who did not leave college with the firm determination of some day owning and working a piece of land. It will be years before some of them become connected with soil culture, but the love of rural pursuits is in them and their college course fastened it. Some of the best lawyers in the State of Michigan are graduates of the agricultural college. One of them was not long since elected a Judge of the Supreme Court of the State, and the fact that he had attended the agricultural college had a good deal to do with his election. Is a lawyer any better qualified to stand as the champion of the rights of farmers because of his course at an agricultural college? I think he is. Professor Porter may not think so.

The plan proposed by Professor Porter is a beautiful one—on paper. I can only give an opinion regarding it, and that is that he could not get a corporal's guard of the class of boys American agriculture needs to attend such a schoo.

H. W COLLINGWOOD.

Farm Topics.

NATURE'S REMEDY FOR A WORN-OUT SOIL.

Excessive cropping ruinous to fertility; clover a rescuer of plant-food from the depths of the soil and the atmosphere; clover sod as a seed-bed; how to get a "catch;" the best mode of treating manure is to haul it out and apply it as it is made; the next best to save it in ridges and spread it as it is hauled; housing manure; never leave it in piles in the field; manuring in spots.

CLOVER.

In Southern Ohio, plow, plow, plow seems to be the rule rather than the exception, and fully half our farmers fail to see in what direction they are drifting. Cropping, cropping, cropping has already taken the cream out of the virgin soil of Southern Ohio. Some, however, are waking up to the evils of this practice, and clover is being sown in many fields. Many of our farmers are beginning to see that this great foliage plant is coming as a succoring angel to the rescue. But to get down to facts: Clover is, in my opinion, the greatest natural fertilizer and renewer of the soil known to man. It penetrates the subsoil with a long, tapering root to a greater depth than any other plant, bringing plant food up from below the reach of other plants and leaving it in the large crown near the surface of the soil and in the dark foliage upon it. I have traced the root of an ordinary stool of Red clover to the depth of 24 inches. Last spring, while working in corn about knee-high, I traced the corn roots and found, to my surprise, that the roots of two thrifty hills would meet across a four-foot row.

Again, we are told by good authority that the clover plant feeds upon the atmosphere, gathering, accumulating and depositing fertility and gases from that source in considerable quantities.

Two years ago, owing to drought, I was short of pasture, and, as a last resort, turned the lambs on the second or seed crop of a three-years-old clover sod. They ate it close, thus making a finish of it. I plowed the land for potatoes. Except for the breaking of the clover roots this piece turned over very easily, the furrow breaking and crumbling as it turned, the soil being clayey. I prepared a very fine seed-bed, though the labor of doing so was less than in any other case producing like results. Clover seems to lift, heave and loosen the soil, thus giving it new life. Despite the dense green foliage, there is a constant falling of dead leaves, causing a black mold on the surface. Part the foliage while in full bloom and examine the moist soil, and you will be as surprised as I was when I made my first clover-hay by forking and handling until the stems were bare.

I hear some talk of clover-sick soil, but the fact is that more soil is sick from the want of clover than from an over-dose of it. Any worn-out field can be seeded to clover if properly managed. If the field is bare and clean, in early spring spread on a coat of manure (a little is better than none); then as soon as the soil can be worked harrow it with a sharp-toothed harrow, sow anyhow 15 pounds of seed to the acre—20 are better—and harrow again. In this way I have never failed to get a good sod of clover. If the soil has any inclination to run to Blue grass, the latter will make its appearance before this crop is exhausted. Where the winter is severe the second or seed crop each year should be allowed to fall down as a mulch for the roots, or else the freezing and thawing will heave the roots out and ruin the crop for next year. This failing of the seed crop perpetuates the sod, the seed coming up the next spring only to make the sod thicker.

I have an old gravelly bank too poor for any kind of a catch of Timothy. It was sown as above described two years ago. I have mowed from it two heavy crops and to-day it is fully half a Blue grass sod. Do you think the plow will get into that? Not soon.

In addition to the advantages of clover as a great life-giver to the soil, no better feed was ever produced than a good quality of clover hay. I have fed it to sheep with no grain whatever with the very best results.

MANURE.

A proper gathering and feeding on the farm of all feed and grain raised, together with a careful saving and judicious returning to the soil of all manure made is a course that will never impoverish any soil. Of course, the tiller of the soil must exercise good judgment in a correct rotation of crops, and avoid breaking a good sod too frequently

A trip through Southern Ohio will reveal, to an observing traveler, the serious fact that fully nine-tenths of all the manure made is thrown out against the side of the stable, many times under the drip of the eaves, there to leach, over-heat, fire-fang and "waste its sweetness on the desert air," and at the same time the very perpetrators of this crime (for crime it is against themselves and their children), will sweat and toil to get together a few dollars to send to some Eastern city for a ton or so of some commercial fertilizer. Why, brethren, these things ought not so to be.

I have experimented considerably with various methods of caring for the manure heap, and the best results have been obtained from making it in the form of a ridge fully exposed to the weather. Make the ridge on well-drained land, allowing no surface water to reach it. It is not best to make it more than four feet high; keep the loose manure around the edges well thrown up. A ridge of this kind will seldom leach; in fact, several times I have turned the eave spout so as to run the water into the ridge when I had any fear of its over-heating, being careful not to let it get more water than it would absorb. Last spring I hauled out a ridge treated as above, that was in excellent condition, well rotted and very little fire-fanged.

Not long since, in an agricultural journal of national repute, I read an article advocating the housing of manure. This I have also tried, and find that if it is piled over a foot deep it will heat, (manure from cattle, of course, excepted) and if it heats it will literally burn itself to death and be as worthless as straw. It may sometimes be advisable to leave the manure undisturbed under the feet of the stock; then it will heat unless very closely trampled, to say nothing about the injury done to the stock.

But as much skill is needed in applying the manure as in keeping it. The best authorities tell us that where the land is level, or nearly so, we should haul the manure direct from the stable to the field as soon as it is made. This is, undoubtedly, good advice and the most economical mode of application, but in a rough, hilly country like this, it is impracticable. Then the next best way is to rot it in the ridge until the ground is plowed, and then apply it on the surface, spreading it evenly and harrowing it in. Hauling the manure to the field and leaving it in small piles is a bad practice. I tried this once to my satisfaction or rather to my sorrow. When I spread the heaps I was very careful to scrape the ground where they stood very closely, expecting it would be the richest. Despite all this the corn was very spotted and uneven.

Last fall I broke an old field to re-seed it. Not having manure enough to cover all of it I hunted out all the poorest spots, bare knobs, etc., and spread what manure I had on them. That piece to-day is spotted. In fact, I fear there will be no grass at all by spring except where the manure was spread. The difference is so great that the irregular outlines of the manured pieces can very easily be traced.

This taught me this lesson: don't plow for anything an inch more land than you have manure with which to cover it.

Finally, the farmer ought not to be ashamed of his calling, neither should he cause his fields to be ashamed of him. He ought to put on his thinking-cap and make his calling a study. He ought to use sense and judgment, for if there is a calling under the sun that needs a proper use of these two virtues it is the farmer's. The bright, wide-awake, thinking man succeeds wherever he goes, while the sleepy, don't-care fellow will fall in the ditch every time.

Athens County, O. A. B. SAUNDERS.

Everywhere.

RURAL SPECIAL REPORTS.

Indiana.

PENDLETON, Madison County, May 17.—The prediction of the R. N.-Y. of a dry season was well-nigh fulfilled. As the winter was the mildest the spring was the driest on record in this region. There was no rain to stop the plow, and corn is all planted and some of it is being cultivated. Wheat has made a good growth and tillered better than usual, and if indications do not change, may make nearly an average crop. Copious rains on May 10—12 have refreshed the thirsty earth and caused vegetables, flowers and all living things to rejoice. P. H. H.

SOUTH BEND, St. Joseph County, May 29.—Yesterday it snowed nearly all day and the mercury was down to 33 degrees nearly the whole time; but it is several degrees warmer to-day. If those engaged in farming experience many springs like this, they will be seeking other means of making money.

T. A. P.

Iowa.

DES MOINES, Polk County, June 1.—May has passed and we are glad rather than sorry; for it was cold all the month. The first half was wet and cold, and on the 19th we had a fearful hail storm which destroyed thousands of dollars' worth of small fruits and vegetables, besides greatly damaging corn and small grains. Ever since the hail storm we have had a cold wave from the Northeast, so cold that we have worked all day with our coats on. May 31, we had a heavy freeze, ice forming one-fourth of an inch in thickness on water in tubs. Vegetables were nearly all killed, and small fruits will be scarce. Apples were badly damaged by the hail storm, and have fallen badly since. Blackberries and hardy apples are all our show for any fruit this year. During the hail storm, currants, strawberries and gooseberries were

nearly all destroyed. Early potatoes and many fields of corn were badly damaged by the last frost. Vegetables are very scarce. Early cabbages were nearly all destroyed by cutworms and the black cabbage flea. There are more of these pests this season than I ever saw. Our prospects for crops this year are gloomy enough at this time. F. S. W.

New Jersey.

TRENTON, Mercer County, May 30.—The weather continues wet here, and it is warm *now* after a cold snap of several days. It is favorable to a heavy growth of grass and wheat and rye straw; but it has been too wet, and, for a few days, too cold for early-planted corn, though favorable to truck. There are enough peaches on to make an average crop, providing they do not fall off prematurely. Apples, where not injured by insects, will be a medium crop. Cherries, a small crop. Strawberries are rotting and sour; but a day or two of sunshine will make them all right. Blackberries are full. Pastures are luxuriant, especially on good ground. F. D.

New York.

FORESTVILLE, Chautauqua County, May 29.—We have had one of the finest springs on record, and the prospect for a large crop of fruit and most other things was very flattering; but, alas! "Old Jack Frost" came this way last night and turned every thing upside-down, destroying the corn and potatoes, killing most of the fruit and damaging the hay, wheat and other crops. It is said to have been the worst frost that this section has known for 30 years. Farmers are feeling blue. The frosts and the trusts are too much for them. Something *must* be done in regard to these trusts, and that soon too.

C. H. F.

Wisconsin.

GREENBUSH, Sheboygan County, May 31.—We had an early spring and crops were looking well; but we have had three hard frosts within a week, and we had a snow storm last night. Fruits are all killed and all corn and potatoes that were up are frozen down to the ground. Our Contest potato plot is ruined, I fear. The currants look as though they were cooked on the bushes. Clover is looking splendid. We have had several heavy rains lately.

GAPES IN CHICKENS.

C. M. L., West Henrietta, N. Y.—I have 20 three-weeks-old chicks that have the gapes. I can save some of them by running a feather or looped horse-hair down the wind-pipe; but I have lost 10 after having drawn out some of the worms that killed them. Now where do these worms come from? Don't say from stagnant water, for there is none. Neither is their presence due to wet weather, for it has been dry. If they come from hen lice, why don't my neighbors' chicks have them? Hen lice are common around here. What is the cause of their prevalence in my flock, and a preventive, and what is a cure for those that are now affected?

ANSWERED BY HENRY HALES.

It is refreshing once in a while to have a communication from some one who evidently has ideas and reflections of his own, and who is not easily satisfied by mere guess-work. Perhaps there is no subject connected with poultry about which so much nonsense has been written as gapes. Many theories with regard to it have been started and discussed, that very ordinary observation would show to be conjectures, with no foundation. These false theories have a tendency to mislead inquiry and observation. The fact is that no one has ever found how the worm is propagated. The highest scientific authorities only guess at it. Dr. Cobbold who is allowed to be the best informed on the gape worm (Sclerostoma synagamus), says: "By whatever mode the young make their exit from the shell, it is manifest that prior to their expulsion, they are sufficiently developed to undertake an active migration; their next habitation may occur within the bodies of certain insect larvæ, or even in small mollusks; but I think it more likely that they either enter into the substance of vegetable matters, or bury themselves in the soil at a short distance from the surface." The last opinion I think much the most likely. After studying the symptoms and insects for 25 years, I am satisfied lice have nothing to do with the matter. Of course, lice will attack fowls ailing from any cause, as it takes the full vital energy of poultry to keep them clear of parasites. Take a number of hens from one house with freshly hatched chicks, put half of them on new ground removed from the old contaminated quarters, put the other half on old infected ground in use the previous year, and most if not all of the chicks will, in the latter case get the gapes. This plainly shows that the contamination does not proceed from the mother hen, or from her personal parasites, neither in my opinion does the insect pass through the intestines or any part of the earth-worm as so many assert, for I have seen pheasants badly troubled with the gapes, that were kept on board floors on a second story of an aviary, so that it would seem that the larva or first formation from the egg, may lodge in old boards, or in the ground near-by the parents' locality the previous year. The gape-worm is not confined to domestic poultry: all the family of Gallus are subject to it, besides some other birds. Change of ground for chickens so that they are not allowed to run at all over the infected places, will prevent the disease, and after a year or two (some say one year) the infected ground will be purified. The only perfect cure for afflicted chicks is the removal of the worms with a small feather or twisted horse-hair. The latter is the better. Have a small loop at the end, watch for the wind-pipe to open as the chick breathes, thrust down the horse-hair the length of the neck, twist it round as it is drawn out, and it will dislodge and bring out the worms. Often all the pests will not come at once, but the chick will sometimes cough out the rest after they have been dislodged by the hair or feather. If the latter is used it must be stripped to the stem, except a small vane point at the end. A piece of camphor about the size of a grain of wheat given as a pill will sometimes destroy the worms: other cures, such as dusting lime on the chicks in a box, or fumigating with fumes of carbolic acid, etc., are recommended, but removing the worms as above is the only way to effect a perfect cure.

RYE AS STOCK FEED; POLLUTION OF CISTERN WATER; A CISTERN FILTER.

D. R., Barnardsville, N. J.—1. Is it safe to feed rye to farm horses, brood sows, and poultry? 2. How can I get rid of a disagreeable odor in the water from a cistern?

ANS.—1. Rye is quite safe to feed to any kind of live stock, if it is free from ergot, but it is not desirable food alone. When ground with corn it is excellent for horses, and pigs. Fowls do not eat this grain readily unless they can steal it, when they seem to be quite satisfied to fill their crops with it. We suppose the grain is referred to. If it is a growing crop the green rye may be cut when in bloom for forage for horses or for cows, although it is not considered a desirable fodder for cows kept for butter. Green rye is a very good food for pigs of all kinds. 2. The cistern should be cleaned out. A very large quantity of filth collects on roofs and is washed into cisterns, and this quickly ferments and gives off very offensive gases which are absorbed by the water. A cistern therefore needs thorough cleaning every spring, and should be provided with a filter made of gravel, sand and charcoal, through which the water passes on its way from the roof. A simple filter of gravel and even of coarse flannel will arrest much of the matter which is washed from the roof, and after a dry time when this collects abundantly in the gutters, the use of a filter is very desirable. A filter may be made of a barrel prepared as follows: bore in the bottom a large number of holes and lay a screen of fine wire gauze over these; on the screen place two or three inches of fine washed gravel; on this four inches of clean river or sea sand washed; then six inches of finely broken charcoal; on this lay four inches of the washed sand; then three inches of the fine gravel and a covering of small stones to receive the water, which is best run through a rose strainer to spread the force of the water and avoid disturbing the filtering layers. The barrel should be placed over the cover of the cistern. Every spring this filter should be taken apart and washed and put together again. Every care should be exercised to keep the cover of the cistern tight and to exclude dust, worms, mice, rats etc., all of which are frequent sources of pollution of cisterns. It is recommended to put a bag of charcoal in the cistern to absorb the foul odors. This is exceedingly bad advice. It is only a temporary device; it only mitigates the evil for a time, and it misleads the people into danger. The foul gases from a corrupt cistern are a most serious danger to health and may very easily provoke attacks of malignant and fatal diseases. The cause of the evil should be removed and avoided.

BLOATING COWS.

G. Mc F., Ladner's Landing, British Columbia.—I have three acres with a heavy clay subsoil. Two have been a long time in Timothy; the other has been two years in Alsike, Red clover and Timothy grass and was pastured last year without any bad effect. This year since the end of March when grass was low, my cows have been occasionally swollen, one so seriously that she had to be stabbed. I have four cows on three acres and there is not a week in which some of them are not swollen and often two at one time—in the morning, at noon or in the evening. The trouble seems to come on suddenly and after a few hours it becomes a little less, but the affected animals are often a whole day without being able to chew the cud. They do not seem to be sick, for when they get a little ease they commence to eat and next day to all appearance they are all right. The grass is very rank and abundant and they have water at will, but it is ditch water. All kinds of weeds are abundant around the fences. My cows had the same run last year and the same water, but there was no trouble.

ANS.—Feed each cow once daily some bran, or give as a drench one-half ounce each of carbonate of soda, sulphate of soda and common salt. Improve the drinking water if possible. When attacked give as a drench one-half to one pound each of Epsom and common salt (according to the size and condition of the animal) with two ounces of ginger. In severe cases also give two ounces of oil of turpentine shaken up in a quart of milk; or one-half-ounce doses of carbonate of ammonia as a drench in one pint of cold water, and repeat this every three hours until relieved. Puncture as before if it becomes necessary.

HOCK LAMENESS IN A MARE.

T. S., Fair Grove, Mo.—My 12-year-old mare was taken lame in her left hind leg, last October. She was suckling a colt at the time, and a swelling appeared on the inside of the leg, a little below the hock joint. She was turned in pasture and the swelling was bathed twice a day, with mullein and vinegar. In a few days it disappeared, but appeared again at intervals through the winter, until about March 20th, when she staid lame until she foaled on April 24th. She was due to foal May 7th. During the last lameness she held up her leg, and when she put it down would just touch her toe. Now the leg is swollen all around the hock joint, but she is not so lame, and holds it up a great deal when standing. The swelling seems to be quite hard on the inside of the leg below the joint, and appears to give her some pain when pressed. What is the trouble, and how should she be treated?

ANS.—This appears to be one of those complicated cases of spavin or disease of the hock, brought about by some injury to the joint. Treatment is not very satisfactory in these advanced cases. The application of the compound solution of iodine—iodine two parts, iodide of potassium one part, water 16 parts—two or three times a week for several weeks; or firing the joint in points, followed by the application of the iodine as soon as the effect of the firing has nearly passed off, might afford some relief. Rest during treatment is essential. We doubt, however, if you will be able to do more than to relieve the mare so that she may be kept for breeding purposes.

SHOULDER OR FOOT LAMENESS IN A MULE.

C. H. H., Bright Wood, Ind.—My four-year-old mule was lame in the left shoulder last year and was treated for sweeny. This year he is a little stiff there and lags behind when at work, stretching his neck out to the right, and flinching a trifle in his left shoulder. There is no perceptible fever there, and the skin is not tight as it was a year ago, but there is a slight depression. His dam was lame in the same place for several years, but a season's rest has cured her. A full brother, a year older, is all right. What's the trouble?

ANSWERED BY DR. F. L. KILBORNE.

If the lameness is in the shoulder it is probably the result of a sprain. A very large proportion of the so-called shoulder lameness is really in the feet and not in the shoulder at all. Judging from the history, we suspect that may be the case in this instance. If you desired us to diagnose the case you should have given the symptoms, *i. e.*, the position of the limb when standing, and the action in walking and trotting both on hard and soft ground. For chronic shoulder lameness due to an old sprain, the proper treatment would be the application of a strong liniment, or a cantharides blister, over the seat of the sprain (made and applied as frequently directed in these columns), or firing in points. Either course would favor a restoration of the weakened muscle or tendon to its natural condition. The firing should be attempted only by a competent operator.

UNDER-DRAINING A GARDEN.

W. F. K., Clinton, La.—I want to underdrain a two-acre garden; what sort of tile would be the best?

ANS.—The size of tile must be chosen in accordance with the quantity of water in the land. Usually one-inch tile is quite sufficient for a two-acre plot when the land is not very wet and springy. Round tiles are the best, using only perfectly straight ones. These are laid in narrow ditches the bottom of which is scooped out to fit the tile. An implement for doing this work is easily made by bending a hoe—having first heated it—to the shape required. The work should be begun at the upper ends of the ditches, and as the tiles are laid they should be covered with earth to avoid disturbing them. They may be laid easily by means of a light rod with a projecting pin on which the tile is placed and lifted into the channel made for it. The tiles should be laid in this manner, the rows being 50 or 60 feet apart unless the land is very wet, when intervals of 30 or 40 feet are not too close. The discharging tiles should be two inches in diameter for the upper half and three inches for the lower half if the number of laterals exceeds eight to 10; a two-inch tile has four times the capacity of a one-inch, and a three-inch nine times the capacity.

ABOUT BEAN CULTURE.

C. M. D., Mansfield, O.—1. Are beans a profitable crop? 2. What is the proper manner of planting, cultivating and harvesting them? 3. Do they do well in heavy clay soil?

ANS.—1. As profitable as ordinary farm crops. The average yield is from 10 to 20 bushels per acre. Bean growers in Western New York say that a crop can be grown, harvested and delivered for about $10 to $12 per acre, exclusive of the use of the land. 2. Those who grow beans on a large scale, use bean-planters either with or without fertilizer attachments. Beans are also planted with a common grain drill by stopping up some of the teeth, putting the drills of beans about 28 inches apart. They may also be planted with hand corn-planters. Cultivate early and often, but do not stir the ground when the vines are wet from rain or dew. They are usually pulled by hand, but machines are used for doing this work where enough are grown to warrant the expense. They are thrashed by hand with flails, trodden out by horses in cold weather, or thrashed by machines constructed especially for this purpose. 3. They do well on almost any soil except muck or a soil that has been manured with rank manure.

HEAVES IN A HORSE.

R. C. Q., Farmingdale, N. Y.—My horse had a cold last winter and it has left him with the heaves. Can they be cured?

ANS.—An exhaustive article on the treatment of horses afflicted with heaves was given on page 767 of the RURAL for 1886. It is doubtful if a genuine case of heaves can be cured, although recent attacks on young and healthy animals may be relieved by proper care and treatment in feeding and handling. Medicines have little effect except to hide the symptoms until the effects have passed off. Attention to feeding and watering is the best treatment both for relieving the disease and for preventing it. Never feed hay, straw, or grain that is the least bit dusty. Cut feed mixed with ground feed well sprinkled with water is good. Do not over-feed; water frequently, but not much at a time. Give half a pail of water before feeding. Do not over-work, but give moderate exercise daily. Keep the bowels easy by green food, or laxatives. Avoid exposing to cold winds or storms, especially when heated.

LUMPS ON COLT'S NECK; BREEDING SMALL MARES TO LARGE STALLIONS.

W. R. S., Maple, Mich.—1. My 12-days-old colt was born with two lumps the size of a hen's egg on the cords in the neck back of the jaw-bones; what should be done? The mare has been in good condition for a year. 2. Is it advisable to breed small mares to large stallions?

ANS.—1. If the lumps or bunches appear to be attached to the skin only, they may be cut out, or a strong twine may be tied tightly

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies.

around the neck of each and tightened daily until the bunches drop off. If they are attached to the deeper structures it would be well to employ a competent veterinary surgeon to remove them. 2 It is not advisable to have too great a difference between the size of the mare and stallion, but within moderate limits there is no serious objection. Mares are frequently bred to stallions larger than themselves, as in the crossing of the imported Percheron on native mares. But for small mares a correspondingly small stallion should be chosen.

STORING CELERY.

W. B. T., Ashville, N. C.—1. Should celery be left in the ground over winter? 2. Why would it not be a good plan to leave it in the ground, bank up the earth well around the plants, put planks to hold it up, then mulch with leaves? My experience is that it will rot when taken up and put in trenches, the earth caving in on it.

ANS.—1. Litt it and store it. 2. In your part of the country (N. C.) this mode would answer very well. The main points to be observed in keeping celery over winter are dryness and low temperature, but, of course, it must not be so low as to freeze. In order to secure these conditions we find it best, in the North, to lift and store our celery close together in out-door ridges which we can cover with boards and leaves or straw, or store it in shed or cellar. Preserving it in the ridges in which it had been grown would entail much labor in banking and covering. We have no difficulty in keeping celery till April.

STRINGY MILK.

G. L. W., Idana, Kan.—My cows give stringy milk; a small tumor forms at times in the teat, and after one or two milkings it breaks and when the teat is pressed what looks like decayed milk comes out in chunks and sometimes in strings. Sometimes it forms in the udder on a larger scale, and unless care is exercised, straining the milk will be impossible. What should be done?

ANS.—Inject such teats after each milking with a solution of five grains each of carbonate of soda and permanganate of potash in an ounce of water, using a small syringe with a small probe-pointed nozzle. Give each cow, in the feed night and morning, two drams of hyposulphite of soda and one ounce of sulphate of soda. If the trouble is in one or two teats only, it is probably due to injury or faults in milking, and this quarter may be bathed with camphorated spirit. But if the trouble is general, it may be due to unwholesome food or water, which should be corrected.

SPLINTS IN A COLT.

H., Whiteland, Dak.—How can splints be removed from a colt's legs? They are on the inside of the front legs near the fetlock joints.

ANS.—You should have been more definite in your description and given the age of the colt, when the splints appeared, presence or absence of heat, tenderness, or lameness, etc. In the absence of these data, we will suppose the "splints" were present when the colt was born, in which case they are congenital and we could not advise treatment without a personal examination. If they do not cause lameness we would advise no interference.

RUPTURE IN A HORSE.

A.. B., (No Address)—What should be the treatment of a ruptured horse? So far as I can make out, the rupture is near the place from which a testicle was removed in a bungling castration.

ANS.—In this case it would be best to employ a competent veterinary surgeon to examine and operate on the horse. Without a personal examination, we could not safely advise you as to the operation in a case of this kind.

BONE AS A FERTILIZER.

C. N. B., Elizabeth, N. J.—Is "rotten bone manure" as good a fertilizer as ground bone? 2. What is the difference, if there be any.

ANS.—Less nitrogen and more moisture are the differences. Whether it is better or less valuable depends upon its fineness and moisture. The finer it is, the more soluble are its food constituents.

Miscellaneous.

J. C. S., Shad's Gap, Pa.—Who make and sell sheep masks?

ANS.—We do not know. Can any of our readers answer.

A. R. A., Mill Brook, Conn.—I supposed a cow's teats were all right when I dried her off last winter; but now she has a calf and I can get no milk from one of the teats. The bag is somewhat hard and swollen. What should be done?

ANS.—The teat should be well milked out at each milking or oftener. The swollen quarter should be frequently bathed with hot water, and belladonna ointment should be applied. The milk will probably come as soon as the swelling and heat disappear.

D. N. H., Manchester, Ia.—1. Why cannot one raise radishes, turnips, beets and other root crops on old land, even if well enriched, as well as on a newly plowed meadow or prairie sod? What elements are lacking? Is there any commercial fertilizer that will supply them? 2. Where can one get a pair of bellows for blowing powder on plants to kill insects, worms, etc.?

ANS.—1. We know of no reason if the land is well enriched, except that insects partial to crops accumulate as they are raised from year to year, to injure either the root or leaf. If any food constituent is lacking in the soil, and one can find out what it is, chemical fertilizers will supply it. 2. The best bellows are the Woodason for sale by most seedsmen.

DISCUSSION.

THE FLESH OF DISEASED ANIMALS NOT UNHEALTHFUL.

J. J. H. G., MARBLEHEAD, MASS.—"The poison of the rattlesnake is injurious when taken into a person's stomach" remarked Mr. Stewart incidentally in the course of his excellent article on the effect of night-soil on the quality of vegetables, in a late RURAL. It is no more so, however, than other medicines, if I have read correctly, for in crude practice it has been administered in this way as a medicine. It is necessary to bring it in direct contact with the blood before its poisonous characteristics are developed. If the liberal use of night-soil made the vegetables raised from them unhealthful, then the population of this vicinity, having used for about 40 years vegetables raised principally on this plant food, should demonstrate in shortened or unhealthy lives the sad fact, but, on the contrary, we claim to be as healthy, robust and long-lived a people as can be found in any section of these United States. Prof. Storer wisely remarked that the process of cooking would destroy all germs capable of injuring health, were there any present. This important fact has not had due weight given it in discussions relating to the unhealthiness of diseased food, either animal or vegetable. Established facts make it safe to say that it matters not of what disease an animal may have died, or in what degree of putridity the flesh may be, when it is thoroughly cooked it becomes perfectly healthful human food, and that therefore the elaborate precaution taken, especially in large cities, to prevent the sale of such food, cannot be defended on the ground that it is injurious to health—the right foundation on which to rest an argument in defence of such municipal regulations is the existence of a sentiment born of our high civilization, which leads us to turn with disgust from the very thought of such a diet. I have said that there are established facts which prove this: let me give an illustration on a large scale. A college mate who has been a resident of northern India for over 30 years, once wrote me the result of the observations of himself and an English physician on the effect on the health of one of the lowest castes into which the natives of that country are divided, of a long-continued diet on flesh of animals which had died of various diseases. He stated that by immemorial custom the flesh of all such animals became the property of this particular caste. At the time he made his observations they were feeding on the bodies of cattle, some 10,000 of which had died of a disease akin to putrid fever, in that hot climate causing much of the meat to be in the first stage of decay before it was cooked. The observations of the English physician were made on the same people under similar circumstances, and they both agreed in their results which were, that this particular caste were not only exempt from all of those diseases which have been assumed to be caused by eating such diseased food, but, on the contrary, they were remarkably and exceptionally healthy. With this demonstration before us, of the perfectly innocuous character of diseased meat *after it has been thoroughly cooked*, while it would not be wise to go and do likewise, nevertheless a knowledge of such facts may save us, who can have but little knowledge of the ante-mortem history of the meats we buy, from such unprofitable fear, and should lead legislators to place all the precautions taken to prevent such food from being put upon the market on the only foundation on which they can honestly rest, viz., a deference to public sentiment rather than defend them as necessary for the protection of the health of the community. The nose and eyes, nature's police, that stand guard over our mouths, to give warning of the approach of the unclean, to protect our health, are really all the police we need. Those who choose to eat meats whose condition may disgust us may take comfort in the fact that the temperature necessary for cooking, by either the roasting or boiling process, must destroy all germs whatever injurious to health, even the dreaded trichinæ. It is a comical fact that the habit of eating what we of the common people call spoilt meat, forms a connecting link between two extremes of the race, the wealthy gourmand who covets his "gamy" flavor, and the low-caste, half-civilized East Indian gnawing with a relish the bones of his half putrid buffalo.

CHEMICAL ANALYSIS FOR FARMERS.

PROFESSOR F. C. SHORT, MADISON, WIS.—A late number of the R. N.-Y. makes the statement that "any farmer would make money by knowing whether his hay was above or below the average in value,'" and also that the "rules governing the analyses of feeding stuffs can be so simplified that any man can learn to analyze hay and grain." The first statement is probably true. There is no doubt that anything which would enable the feeder to estimate accurately the value of his fodders would be a great benefit to him, enabling him to feed them to the best advantage; but it is an open question if a chemical analysis alone would be of any advantage to him. The chemical analysis of a fodder, as an indication of its feeding value, is at the present time much overrated. The value of a fodder depends on the amount of digestible nutrients it contains, and this is determined by the condition of the fodder, soil, climate, time of cutting, etc. For example, oat straw may contain from 0.19 to 3.50 per cent. of digestible albuminoids; clover from 3 to 11 per cent. according to the time of cutting. The digestibility of the albuminoids of meadow hay ranges from 39 to 79 per cent. In fact, all fodders are subject to like variations. Consequently a chemical analysis alone tells us but little of the value of a fodder, and, unless it is taken in connection with other data, is absolutely useless. These other data the farmer has under his eye. He knows the condition of the fodder, the time of cutting, whether his animals eat it eagerly or not. Having all these conditions under his observation, the question is whether the farmer cannot feed just as intelligently by taking the average of a large number of analyses and determinations for the value of his fodders. The complaint made by the R. N.-Y. that, according to analysis, there is a variation of 10 to 50 per cent in the value of samples of the same fodder is certainly a true one, but it is also true that the percent. of digestible nutrients has as great or a greater variability and unless we are able to combine both the percentage composition of a fodder and its digestion coefficient, the average of a large number of fodders taken from the table would prove a better guide than a simple chemical analysis, however accurate. Fortunately considerable liberty may be taken in adjusting the ratio of carbohydrates to albuminoids without any loss in economy of feeding. Although the results of many experiments have shown that a nutritive ratio of 1: 5.4 will give the best results, yet the same experiments also show that a feeding standard like the above can have only a general value, and that feeding must be largely influenced by the individuality of the animal as well as by the quality and value of the fodders used. The farmer who looks carefully after the quality of his fodder and takes the figures given in the tables for its composition and digestibility and makes up his rations accordingly, will find just as good results following his feeding as if he made a chemical analysis and a digestion experiment with each fodder in the barn. To the second statement there is but one answer, and that is that it is absolutely impossible for the farmer to make an analysis of his fodders. Expensive apparatus and long training are necessary for work of this kind. In place of its becoming more simple, fodder analysis is becoming more complicated. It would be much more practical for the farmer to attempt the manufacture of his plows and wagons, a line of work in which he has some practical knowledge, than to attempt the analysis of fodders, a line of work in which he would be utterly at sea.

THAT CHURN CONTEST AGAIN.

P. B. S., CONCORD, N. H.—In the RURAL of May 25 a paragraph tells of the test of three different churns at the New Hampshire Experiment Station; but all the important results are not given. In the three trials made at that time, 128 4 pounds of cream were used in each churn. The results were as follows:

Davis Swing made 39.81 lbs. of salted butter.
Stoddard made.... 40.53 " " " "
Blanchard made... 41.12 " " " "

Why is not that the best churn which will make most butter of at least equally good quality, from the same quantity of cream? And is it not about time to bury that old "chestnut" that the inside floats of the Blanchard churn injure the grain of the butter and interfere with its granulation? This assertion has been demonstrated time and again to be utterly false, and it is well known that some of the finest butter in every respect has been made in the Blanchard churn. All butter comes in granulated form, and the process may be stopped at the desired point in one churn as well as in another. We think the manager of the experiments wandered a little outside of his province when he stated in his report which churn he liked best. We want the hard facts which resulted from his experiments, not his opinion as to the comparative merits of the different implements. There are plenty of good butter-makers of much longer and larger experience than he possesses, who would not agree with his "opinion."

MILK FOR CHILDREN.

P. H. R., DOWNIEVILLE, CAL.—"I cannot refrain from saying a word about the ideas of Dr. Learned concerning the asserted superiority of cow's to mother's milk for children, as quoted in the RURAL of March 23. The ideas are too absurdly ridiculous to deserve notice, and were it not for the fact that some ignorant mother might attempt to follow such advice, and tearfully regret it, I would not care to use the RURAL'S valuable space to discuss it, however briefly. In the discussions at all the late conventions of medical men the subject of dietetics has occupied a prominent place, and the feature pertaining to infant feeding has been the most prominent of all; and the medical men universally agree that in both theory and practice the mother's milk is the best food for infants, and that the food most nearly like mother's milk is next most desirable. Cows' milk is quite dissimilar to woman's milk. And many foods, theoretically like that of the natural mother, fail to give at all similar desirable results. But for that most pernicious idea that mothers cannot, without great personal sacrifice, nourish their offspring at the breast, the present alarming infant mortality would be greatly reduced. And if there is a personal loss attached to the feeding of the infant in the natural way, surely that is one loss from which the natural, pure-souled mother would gain exquisite pleasure.

NUMBER OF HENS TO A ROOSTER.

"WYANDOTTE," CRANFORD, N. J.—The RURAL'S resolution, as expressed in Brevities, hereafter to take all its eggs for setting from a small pen of hens mated with one rooster, needs some qualification. That several roosters running with a large flock of hens, give very unsatisfactory results, is a fact long since recognized by breeders, for one will either be boss of the roost, and keep all the others in mortal fear of him, or else there will be perpetual war in the camp to the utter neglect of business. The only satisfactory way of getting fertile eggs is to keep one rooster with a single pen of hens. But how many hens? That depends. In case of the large, heavy breeds, like the Brahmas, with their deliberate ways and sluggish temperaments, a-half dozen hens to one male will be enough. With the medium weights, like the Wyandottes and Plymouth Rocks, the number may be doubled; while the festive Leghorn, or the foppish Minorca rooster will attend to from 15 to 25 hens with more satisfactory results than a smaller number. These conclusions are not the result of guess-work or fine-spun theories, but of observation and experience. Other considerations are the age and condition of the male. A fully matured, vigorous rooster may be allowed to serve a greater number of hens than a young or undeveloped one, though the latter should never be used.

INSECTICIDES.

I. R. H., MOUNTAINVILLE, N. Y.—For the past 13 years I have used pure pyrethrum powder for the destruction of the cabbage Flea-beetle by throwing it through the foliage with an air-gun. In 10 minutes' time the pests are usually all dead. I think this will prove an effectual remedy for the potato-flea-beetle. [The proper name of the pest is the Cucumber Flea-beetle—Haltica cucumeris—but it appears to be quite as partial to the potato as to any other plant. EDS.] It is equally effectual for the striped squash-bug, killing it in the same time. It answers also for rose-bugs, for which pests I myself used it 10 years ago, but it takes about a half hour to kill them. It also answers for the green cabbage worms, taking about one hour to kill them. There is hardly an insect or worm around here, that I have not killed with it. It will kill wasps in about 15 minutes. The most difficult thing to kill has been the black squash bugs as it takes them two hours or more to die.

R. N.-Y. We have tried Buhach in water without any effect. Thanking Mr. Hawkins, we shall try the dry powder.

KINDNESS TO LIVE STOCK.

C. F. V., DARIEN, CONN.—The two horse pictures lately published by the R. N.-Y. when placed side by side need no further explanation. Their appearance speaks louder than words. The contrast makes one think, not only of the abuses many horses suffer, but also of the unnecessary hardships endured by stock of all kinds. There is evidently some difference in the ages of these two horses; but this brings out more forcibly the fact that the older the animal the more subject it is to abuse and neglect. Care and kindness will produce more flesh and work from the horse than roughness and neglect with twice as much grain and hay. This also applies to oxen, and milk or butter from the cows; also to the growth and appearance of the young stock. Brother farmers, don't let us treat our stock when alone with them as we would not treat them when friends and neighbors are about. Don't let us allow cruelty from the hired help either.

ASHES FOR CURRANT WORMS.

F. D. C., CHARLTON, N. Y.—White hellebore is the common remedy for the worms on currants and gooseberries. There is no doubt of its being effectual when thoroughly applied. I found my gooseberries and currants covered with worms, a few days ago, and in some cases they had about eaten up all of the leaves on the gooseberries. The pests were of all sizes. There was no hellebore at hand, and something must be done at once. Pails of water and wood ashes were brought. With a watering pot the bushes were thoroughly wetted and then the ashes were dusted over them. The next day not a worm was to be seen. This is a cheaper destructive agent than hellebore, and something a farmer always has on hand. My success in saving these berries has pleased me so much that I hasten to tell the RURAL readers of it.

What Others Say.

AT THE VERMONT EXPERIMENT STATION last year a test was made of the different methods of planting that are possible, with the Eclipse corn planter. The field was heavily fertilized with chemicals, 200 pounds per acre being put in the hill or drill with the machine and the rest scattered broadcast. The rows were each 36 inches apart. The first two rows were planted with the planter set to drop five kernels in a hill, 36 inches apart; the next two rows with the machine set to drop three kernels every 24 inches: the next two rows two kernels each 12 inches and the next two rows were intended to be one kernel each six inches. Then the whole set was repeated and then repeated again, making six long rows for each of the four methods of planting. It is not to be understood that these kernels were planted exactly as they were designed, for on rough ground the planter varies slightly in the number put in a hill, and sometimes scatters between hills. The trial was with the planter just as it would be used in ordinary farm practice.

The six rows of each of the four methods were weighed separately after the corn had stood several weeks in the shock and was quite well dried.

METHOD OF PLANTING	W'G'T OF EAR CORN.	W'G'T OF STOVER.	TOTAL W'G'T OF CROP.
Hills 36 in. apart.	890	1003	1393
" 24 " "	343	1015	1358
" 12 " "	303	980	1283
" 6 " "	224	1319	1543

It will be noticed that the two extremes did better than either of the means, the one extreme excelling in ear corn and the other in stover. This would seem to indicate that for ensilage and fodder the greater weight can be obtained by quite close planting, yet as no analyses were made it is not certain that the 36-inch planting did not give more real animal food than the 6-inch, since it grew a much larger amount of grain, and a pound of its more fully grown and perfected stalks was probably worth more for feeding than the less mature and more watery stalks of the closely planted rows.

BY THE SHORT WAY.

"THE R. N.-Y. ventures to predict a very dry season, for the East at least. Come now, Brother R. N.-Y., please quit that. The Farm Journal knows nothing about future weather, neither do you, nor is your guess worth more than ours, which is nix."

We don't profess to *know* anything about "future weather" either. Nevertheless, the prediction is somewhat more than a mere guess. For two seasons in succession we have had considerably more than an average rainfall. During the past winter the rainfall was excessive. This therefore, brother F. J., is why the R. N.-Y. predicts for the East a very dry season. The prediction is reasonable enough; isn't it?.....

IN the same issue the F. J. tells us how we may cure biliousness and dyspepsia:

"A milk diet, with a little lean meat and two vegetables for dinner, and brown bread at each meal, continued for three months, will often cure a bad case of dyspepsia."

Will our much esteemed friend tell us *what* two vegetables? Two potatoes, two heads of lettuce, two green peas, two cabbages? Or shall we be allowed one green pea and one potato; one head of lettuce and one cabbage; one onion and one tomato, etc.?.....

COLONEL CURTIS says that butter may be made in the summer in a small dairy and packed away for winter's use if it is properly made. The cream should be churned at least within three days after it is taken from the milk. The first two days it should be kept in a temperature not above 55 degrees. The butter-milk should be well worked out, and the butter packed in glazed stone jars and then covered with brine and set in a dry, cool place, where there are no bad odors. The cream should be taken from the milk within 24 hours after setting. If left longer it will be damaged. The jars may be small. The sooner the jar is filled and the brine put on the better.....

WE need not look for large grapes and large bunches if the vine be permitted to bear all that set, assuming the vine to be a heavy bearer. Thin out the bunches so that each shoot shall have only its share. A good way to ruin a grape vine for years or forever is to let it bear a full crop. Confine spring-set plants to one or two shoots. In older vines, pinch out all but one shoot proceeding from a single axil. To protect the bunches from rose-bugs, etc., it is well to bag them as soon as the berries set. If bagged while in bloom, many berries will fail to set.....

THE simplest way of making the kerosene emulsion is that advocated by Professor A. J. Cook. Soft soap, one quart, or hard soap one-fourth of a pound; two quarts of hot water and one pint of kerosene. Stir or shake these until all are permanently mixed. Then add 10 pints of water. This will make just about two gallons in all. Is not that right, Professor Cook?.....

THE Minnesota Experiment Station burnt a part of a plot of Orchard grass, while a thick mat on the other portion was left. Decided injury to the burnt half was noticed during the entire season. Not only was the first crop thinner, six inches shorter, and of a somewhat sickly color, but the second crop also plainly showed the bad effects of the burning.....

"WE have just learned that the Cucumber Flea beetles, which cut down the potatoes on the R. N.-Y. famous contest patch of last year, have again been devouring the tops of the early potatoes in the corresponding plats this year. We are informed also that none of the remedies tried have been successful yet, and that so many have been used that it is feared they have injured the foliage of the plants. Here is a case in which one would have supposed the grower would have been forewarned and forearmed. But, really, all the men of science reported that the insects were not likely to be troublesome a second year. And, again, the beetles last year did the damage before it was known what the plague really was, and perhaps the R. N.-Y. thought that if it watched and detected the beetles in the act it could defeat them. But in this it seems to have been mistaken. The moral of all this is, that even when we exercise all due caution some tiny insect will blast all our hopes."....

The above is from our respected contemporary the Philadelphia Press. Yes, we were forewarned and *thought* we were forearmed. We were told by at least four persons that tobacco water would kill or drive them away. It was the first remedy tried. Then we tried tobacco soap. Then both together. It didn't discomfit them in the least. It is true that the application of so many repellants and poisons has injured the vines. Those of one trench, it was thought were so injured that they would probably die. They were pulled up and another variety planted. These last will stand a poor show since, it is feared, the rows on either side will meet before they can get a good start. As was stated two weeks ago, unleached wood ashes seem to repel this pernicious insect. We poison the ashes, instead of plaster as hitherto, with London-purple or Paris-green. Why is not it a good plan? There is no better fertilizer for potatoes than ashes if we add nitrogen in some form.....

CUT the Orchard grass before it blooms.....

WORD FOR WORD.

——WASHINGTON CRITIC: "It is about time now to turn the hoes on the corn-field".

——"BUT the tongue can no man tame; it is an unruly evil, full of deadly poison."

——JOHN MINNET, IN FARM JOURNAL:—"No corn or corn meal should be fed to the sow for several days after the pigs are born? Bran and water are all the food required. If this diet be had for a week before the pigs are due it would be better."

——"THE SOW with a litter of new-born pigs should not be disturbed for 24 hours. In a natural state they will not leave the nest for two or three days. The placenta furnishes the needful food."

——"A LITTLE BED is best for the breeding sow. The new-born pigs get tangled in the straw when there is too much, and they get under it and the sow lies on them. They should always be in sight. A dry, hard bed is best."

——"IT is possible to rear pigs so as to to have 75 per cent. of lean meat in them. This can be accomplished by feeding bran, middlings and skim-milk, or bran and middlings. Hogs need salt as much as any other animal."

——"A TEN-HOUR husband ought not to have a sixteen-hour wife. Reform, brother, at once."

——"FINE wire netting will not 'kill three birds with one stone,' but it will keep three pestiferous enemies from young fruit trees if properly applied: Get a roll of such as is used on fly screens, and cut into strips eight or ten inches wide, and as long as the roll is wide, and wind them the long way around a broom handle to give them the proper 'set.' Spring one of these open and let it coil itself around each young tree. It will 'give' with the growth of the tree, and neither mouse, rabbit, nor *borer* can get through it."

——FARMERS' REVIEW: "In the official report of the State Board of Agriculture of Ohio for December, 1888, the analysis of the Western Reserve Fertilizer, Jonathan Warner, Mineral Ridge, Ohio, is given as follows:

Per cent. of ammonia	
Total per cent. of phosphoric acid	trace
Per cent. of potash	0.73
Commercial value of potash	$0 95
Estimated value of fertilizer per ton	$0.95

SUCH is the commercial value of the constituents of a ton of this fertilizer as found by the Ohio State Board of Agriculture in 1888. A wagon load of earth from a corn field should show better than this, and a ton of leached hard-wood ashes would show much better."

——HENRY STEWART:—"The farmer works less than the average business man in spite of the prevalent belief that he is a toiling slave, laboring 'from sun to sun.' This is a fiction of the imagination of people who know nothing of farm life, for a good farmer, even one who works up to the high pressure, has more leisure than a mercantile clerk or his employer."

——"THE GREAT advantage of soiling cattle is that it is exceedingly comfortable for the cows, insuring full feeding with the best food, the largest supply of the best milk, and the ease and comfort of the owner. There is no driving of the cows, no wasted time of the owner, everything is done with ease and at the right time, and there is a certain regularity about the work which takes away all the laboriousness and worry from it."

——DR. TALMAGE: "The trouble is, my friends, that the people do not understand the ethics of going in debt, and that if you purchase goods with no expectation of paying for them, or go into debts which you cannot meet, you steal just so much money. If I go into a grocer's store, and I buy sugars, coffees and meats, with no capacity to pay for them and no intention of paying for them, I am more dishonest than if I go into the store, and when the grocer's face is turned the other way, I fill my pockets with the articles of merchandise and carry off a ham. In the one case I take the merchant's time and I take the time of his messenger to transfer the goods to my house, while in the other case I take none of the time of the merchant, and I wait upon myself, and I transfer the goods without any trouble to him. In other words, a sneak thief is not so bad as a man who contracts for debts he never expects to pay."

——PHILADELPHIA WEEKLY PRESS: "Everybody knows better than to eat in a hurry and without sufficient mastication. Everybody knows it is a crime to satisfy his appetite and then to overload his stomach because some rich dessert is offered him. Everybody knows that food fried in grease is indigestible; that hot bread is less wholesome than stale bread, and that tobacco is not a nutritious article of food. The farmer who is as careful about his own stomach as he is of his horse's or cow's will soon learn what food is most profitable for him."

——N. Y. SUN: "Dr. George B. Loring, our Minister to Portugal, has been commissioned by the New England Agricultural Society to try the experiment of grafting barbed wire on the cork tree with a view of producing cork-screws at reduced rates."

THE AMERICAN AGRICULTURIST, speaking of rose-bugs, tells its readers that arsenical poisons, kerosene emulsions, pyrethrum powder, and all the usual insecticides have proved powerless against this sturdy pest, which defies everything except actual capture by hand.

Not so, friend. Buhach, either the powder or water solution, will bring them down in 20 minutes or less. If applied every day, during their short period of existence, all sorts of plants which they attack, will be effectually protected. The R. N.-Y. was the first to discover this remedy, and the A. A. ought to tell its readers about it. The Bordeaux mixture is thought by Col. Pierson to be a remedy also.....

"THE office should seek the man, but it should inspect him thoroughly before taking him."

"STILTS are no better in conversation than in a foot-race."

THE Good Samaritan helps the unfortunate way-farer without asking how he intends to vote."

"IT is the foolish aim of the atheist to scan infinitude with a microscope."

"WHEN poverty comes in at the cottage door, true love goes at it with an ax."—*Century.*

For Nervous Exhaustion

Use Horsford's Acid Phosphate.

DR. H. C. MCCOY, Algona, Ia., says: "I have used it in cases of dyspepsia, nervous exhaustion and wakefulness, with pleasant results. Also think it of great service in depressed condition of the system resulting from biliary derangement."—*Adv.*

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JUNE 15, 1889.

THE R. N.-Y. tried the Bordeaux mixture, of the strength recommended for grape-vines by Col. Pearson, on rose bushes. The effect was to kill the foliage and blast the buds. We shall try it again, using but one-quarter of a pound each of copper sulphate and unslaked lime to one gallon of water. It is necessary to pass the lime-water through a sieve if the liquid is to be sprayed on the plants.

ACTIVE preparations are now being made for the taking of the next census. A special effort is to be made to render the report on the mortality and vital statistics as complete as possible. Robert P. Porter, the new superintendent of the census, informs us that efforts are being made to communicate with every physician in the country in the hope of obtaining an accurate estimate of the birth and death rates of sections where there may be no satisfactory system of State or municipal registration.

"Would agriculture have kept pace with the advances in other lines without the aid of the agricultural colleges and trial stations of Europe and America?"—PROFESSOR BUDD, page 395.

A FEW weeks ago the R. N.-Y. said it was puzzled at the ability of a Jersey cow to extract a high, rich color for her butter from food that gave, when fed to other cows, but a pale, light tint. Here is another case. We have a Langshan hen running in a yard with some White Leghorns. Of course, these hens get the same kind of food. The Langshan lays an egg with a dark-brown shell, while the egg from the Leghorns are pure white After all, perhaps this is not any more strange than the evident fact that a certain action or statement may suggest to the minds of two different men entirely different ideas that lead to widely different results.

PROFESSOR F. C. SHORT concludes, on page 398, that "it is absolutely impossible for the farmer to make an analysis of his fodders." He says that fodder analysis is becoming more and more complicated. His idea is that the farmer will do better to look carefully after the quality of his fodders, take the figures given in the experiment station tables, and knowing the history of his handling and curing, make his own estimates. What the R. N.-Y. wants farmers to do is to study into the real meaning and value of an analysis of food stuffs. It still believes that the successful farmer of the future will have to be a chemist, in a small way, at least.

"Are the 17 men whose barns I passed by in a 30-mile ride, last winter, ignorant that they ought not to throw out the manure of their long cow stables under the stable eaves, as they certainly did?"—B. BROWN, page 394.

THE variety of strawberry which it is proposed to call the Parker Earle, if it prove worthy, bears at this time more berries than any other kind we have ever raised. It remains to be seen how well they will ripen. Its season is probably from medium to late. It originated with James Nimon, of Denison, Texas, and will be introduced by Prof. T. V. Munson of the same place. Mr. Nimon writes us, under date of May 25.: "In fruitfulness, beauty of berry, high quality and vigor of plant it certainly surpasses any thing we have here, and we have a majority of the wonderfuls in the strawberry line." If this berry prove to be all that it promises now, we shall give careful illustrations later.

THE Connecticut legislature ought to feel proud of having just passed a law forbidding hens to trespass on other people's gardens. The penalty for violating this beneficent law is a penalty of seven dollars with costs, to be inflicted on the owner of the trespassing hens. The effects of the measure are already excellent. Leghorns, Minorcas and Games, sequestered behind picket fences 15 feet high, are as harmless to neighboring flower beds and truck patches as are Brahmas, Cochins and Wyandottes in three-foot-high inclosures. Sweet Peace begins to smile through all the rural districts, the cause of endless bickerings between neighbors having been removed. We hear a good deal at times about "protection" for the American Hen; would that we heard more about protection against her!

"The agricultural colleges have done more to raise the standing of agriculture and agricultural papers than most people are aware of, and they have made it possible to establish and maintain the experiment stations."—DR. BEAL, page 395.

A CAREFUL farmer who "makes farming pay," tells us of two points about poisoning potato beetles that he is satisfied about. He can put on the mixture of Paris-green and plaster at less expense than he can handle the water mixture. Hand-picking the beetles pays him. The first brood can be picked with little trouble. At the first hoeing it is not much extra work to destroy the eggs that are in sight. Any mixture of poisons, he thinks, injures the plants to a certain extent and the application should be delayed as long as possible. The eggs hatch out irregularly. A few vines will be first attacked. The grubs can be knocked from these few vines with little trouble and one application of poison will then answer for the main crop.

THE R. N.-Y. has had considerable to say about the patent silage or "preserved fodder" made by Mr. S. M. Colcord, of Massachusetts. We have been at some little pains to investigate the process by which this "preserved fodder" is made, and do not hesitate to say that the specimens of it we have examined are superior to any sample of ordinary silage we have ever seen. The last sample sent was taken from a part of the silo where 20 bushels of early apples were thrown with the corn. These apples were preserved in excellent condition, fully "good enough to eat." The experiment stations of Wisconsin, New York, Massachusetts, Michigan, and in fact, a dozen other States, ought to test this "preserved forage" side by side with ordinary silage. The R. N.-Y. asks them to do so.

A SUBSCRIBER calls attention to the lack of information regarding what he calls "the underground geography" of farms. He refers to the drainage and he makes an excellent suggestion when he says that there ought to be a careful map of all drains so that a new-comer may know just what facilities his farm enjoys for the disposal of surplus water. Such a map accurately prepared should be given with a deed of the farm. It would add considerably to the farm value. We know of farmers who have been put to a vast deal of trouble and expense by their inability to locate drains that had become clogged or broken. A man should never put his property in a hiding place so secure that he cannot find it. That is what a man does who digs a drain through his farm and then fails to mark the place where it runs.

"The industrial revolution of our generation, of which the railway and telegraph and the wonderful improvements in machinery of every description are but the material indications, does not stop at the gates of agriculture in its intellectual phases any more than in its material manifestations."—DIRECTOR THORNE, page 395.

"ONE of those six flowers in the goblet of water is General Jacqueminot. Which is it?" (Its foliage was concealed by the others.) This question was put to three persons in the R. N.-Y. office. The roses were carefully examined as to color, shape, number and size of petals, and also as to odor. Not one of the three selected the Jacq. The other five roses were from a plant of Rosa rugosa Harrison's Yellow origin. Strange, is it not, that a rose so closely resembling Jacq. should have come from such parentage? The leaflets, as our readers have already been informed, are much larger than those of Rosa rugosa, with the same peculiarities though less pronounced. It is thought that we have in this hybrid just what every one wants, viz., a perfectly *hardy, double, ever-blooming, fragrant* rose. The beautifully distinct foliage, like that of its mother, is, moreover, less subject to attacks of insects than the leaves of other roses. It is proposed to place this rose in the hands of some nurseryman or florist for propagation and introduction, since such work is not in the R. N.-Y.'s line.

PROFESSOR SHELTON'S pig-feeding experiments go to show that farmers in the West, where pork-making is the main business, should as a measure of economy, continue to use corn as their staple fattening food. Doubtless this conclusion is in full accord with local conditions. In Kansas, as Professor S. says, milk, peas and other supplies of nitrogenous food are not to be thought of—they cost too much to produce. Professor S. does not give an opinion as to what would follow in a section where these foods can be secured. As a matter of fact, such an opinion has little to do with the business of the Kansas farmer whose object it is to produce all the pork he can at the cheapest possible cost. It is the R. N.-Y.'s. opinion that the farmer who can establish a reputation for producing "lean" pork will be able to work up a profitable business for that product. We mean pork with a greater proportion of lean than is found in that sold in the general market. The demand is for lean pork, there can be no use in denying the fact, and it seems evident that this lean product is to be produced outside of what is known as "the corn belt."

"Finally, the farmer ought not to be ashamed of his calling, neither should he cause his fields to be ashamed of him. He ought to put on his thinking cap and make his calling a study. He ought to use sense and judgment, for if there is a calling under the sun that needs a proper use of these two virtues, it is the farmer's."—A. B. SAUNDERS, page 396.

WHAT the R. N.-Y. has tried upon the potato vines of its "Contest" plot to repel or kill the villainous Flea-beetle: Tobacco soap, tobacco (stems) water, whale-oil soap, thymo-cresol, Paris-green, London purple, crude carbolic acid on corn cobs, one each between the plants, hellebore, Buhach, sulphuric acid, Bordeaux mixture, aloes, ammonia, snuff, "Peroxide of Silicate" and unleached wood-ashes. The result of all this (excepting the last mentioned) has been to weaken all the vines and to kill 36 plants. The unleached wood ashes have the effect of repelling the flea, but it is necessary that every leaf should be covered, underneath as well as on top, to give perfect protection. The vines are first sprayed with water and the ashes are then sifted over them. Paris-green or London-purple is mixed with the ashes, the same as with plaster to kill the potato beetle.

The Flea-beetle's preferences are no less marked than inexplicable. A neighboring field of Early Sunrise potatoes is not infested, while across the road the Thorburn is alive with them. The R. N.-Y. No. 3 is in one field much infested, while in another, it is not attacked. The same may be said of Brownell's Winner. Tomato plants are dying by hundreds from the effect of perforated leaves caused by this terror.

THE CONEMAUGH HORROR.

WHILE the actual loss of life in the Conemaugh Valley can never be known, enough about it is already known to leave no doubt that it is the most fatal calamity that has ever occurred in this country or in the civilized world in modern days. Unlike all other catastrophes within our remembrance, this grows greater as we get nearer the facts. Its enormity has outdone exaggeration. There is no silver lining to the dark cloud that flooded the unfortunate valley. In a few hours, almost without warning, a scene of busy life and cheerful, profitable industry was changed into a scene of awful turmoil, death, destruction and desolation. The flood that swept the inhabitants of the valley to death has forced open the pockets of the world. From all parts of this country generous contributions of money, food and clothing are pouring towards the scene of the disaster to repair, as far as possible, the material losses of the sufferers and to relieve their distress.

Foreign countries are also liberally contributing to the charitable tide, but however magnificent the display of spontaneous benevolence, even the material relief can only be comparatively small in view of the enormity of the losses. These are total. Men insure against fire, but who on land insures against water? Even the payment of life insurance risks will be jeopardized or hampered by the impossibility, in most cases, of identifying the dead or even of proving actual death. Then again, pestilence threatens to add to the horrors of the tragedy. Let no one say "Enough has been given or will be given without my mite;" but let each give as generously as his means will permit, and give at once. All classes, ranks and ages are represented among the sufferers, and all classes, ranks and ages should contribute toward their relief.

A WORD ABOUT STOCK IMPROVEMENT.

AN Ohio subscriber writes as follows: "The RURAL has struck the key-note of more failures in raising trotters on the farm than are due to all other causes combined—'breeding inferior mares to high-priced stallions.' The chances are all against such methods. All one can get at the best will be an animal just fast enough to be beaten by everything it tackles."

And yet hundreds of farmers will not believe it, and prefer to lay the blame at some other door. It is strange, indeed, that some farmers *will* not understand the principles of profitable breeding. Here is an instance: The R. N.-Y. has an excellent Jersey cow—good enough to be called a "great" one. A farmer in the neighborhood has a scrub bull, a mixture of various breeds, with absolutely nothing in the way of shape or pedigree to indicate dairy superiority. This animal was not castrated, simply because his owner meant that he should pay for his food until three years old by service—after that he is to be castrated and turned into beef. This neighbor felt much hurt because we refused to patronize this animal, and laughed at our plan of hunting the country over for the best Jersey bull in it. Another neighbor hears about the affair and at once proposes to patronize the Jersey bull. His cow has a pedigree about like that of the scrub bull; but he has thoroughly convinced himself that the calf will fully equal the R. N.-Y.'s cow's simply because its father can boast "Jersey" blood. He will be a sadly dissappointed man and will doubtless do all he can in future to ridicule the plan of stock improvement by careful breeding.

"Colleges make neither doctors, lawyers, preachers nor engineers. After the college has done for the student all that it can do, it has only brought him to the gateway of his profession. When the professional colleges turn out none but fully equipped and successful professional men, then, and not till then, shall we have a right to demand that the agricultural colleges graduate only fully equipped and successful farmers."—DIRECTOR THORNE, page 395.

BREVITIES.

FRIENDS of the agricultural colleges are evidently by no means bashful about defending these institutions.

THE R. N.-Y. is very glad to learn that experiments with poultry are contemplated at the New York Experiment Station.

"THE issue of the R. N.-Y. for May 25 fills the bill for an agricultural paper better than any other issue I ever saw, and as I have taken the RURAL for 36 years it seems as though I ought to know something about it."
Wayne County, N. Y. JOHN BRADLEY.

"CONDENSED CREAM" is the latest dish offered to city people. It is put up in one-pound cans, and sold for 10 cents per can. It has a suspicious flavor of corn-starch about it. "The word CREAM as applied to all canned products of the dairy, is copy-righted."

MR. DREW'S "EYE-OPENER" this week is a novelty. It is a true statement of fact. It ought to put visitors to this city on their guard. Scoundrels like our friend "Cummings," are constantly on the watch for victims. Their favorite prey is the "smart" young man—the one who "knows it all".

In some parts of Michigan farmers are reported to be paying nearly two bushels of potatoes, at five cents per bushel, for one pound of sugar, at nine cents per pound! There isn't stock enough to consume the surplus tubers, and they are not considered worth five cents per bushel for fertilizing purposes so long as tons upon tons of manure are allowed to go to waste. It is to be hoped that prices for other farm products are high enough there to "even up" the list to a profitable level.

IT is very well to put into the nests carbolic acid, lime, tobacco and the like as many recommend. But these are merely repellants. They drive the lice out of the nest, but do not kill them. Many years ago the R. N. Y. began its advocacy of *spraying* the houses and nests with kerosene. We find it a perfect remedy and one that is quickly applied at a trifle of cost. Houses treated in this way once in two weeks need never be white-washed. There is no need of it.

The Herdsman.

SELECTING A BULL

DOES SOILING IMPAIR VIGOR?

MUST ANIMALS EXERCISE?

A SUBSCRIBER in New York State sent us the following letter, and as it has to do with a matter that is being now quite generally discussed, we have made it the basis for the following discussion:

"I expect to purchase a bull for my dairy. I find that some of the breeders that I have corresponded with soil their cattle so that the cattle have comparatively little exercise. I have plenty of pasture, and shall not raise any soiling crops. I am told that an animal from a herd that has been kept on the soiling system for a number of generations, will not do so well on my pastures as would one raised more as I should raise him. Is there anything in this?"

FROM L. F. ALLEN.

Can cattle accustomed to soiling do as well in pasture, after they have become used to feeding in the stable? I do not know why a change from one kind to the other should affect their dairy qualities if they were well fed in both cases. Cows while soiled in confinement in stables or sheds should have more or less exercise through the day—an hour or two, more or less, as convenience may govern. Cows that run at pasture when they have to range over large spaces for their food, fall greatly off in their production of milk owing to the harmful exercise required in gathering their food. A ready filling of the stomach, and an immediate rest afterward until the time for feeding again are great stimulators of lacteal production. Therefore unless abundant pasture is furnished, the best and most economical way is to adopt soiling throughout the grazing season. During the winter season while cows are in the stable, a few minutes' or even an hour's exercise in a well wired inclosure outside is beneficial and even necessary for the highest health of the animals.

A bull should never run at large with the cows either in a yard or pasture. He should be always stabled or yarded—stabled always in winter, and closely yarded in summer, or even stabled if necessary, but in such a case he should have some exercise during the day. If he is allowed to run loose with the cows, he is either idle or teasing them with his importunities, whereas a single service or, at the most, a double service is all that is required for procreation. At the time of heat, the cow should be withdrawn from the herd, quietly placed with the bull, and after she has been served by him she should be placed in a stable stall, or small yard by herself until her excitement has fully passed. If she is sent immediately back to the herd, she is again worried to no good purpose, but to her detriment. So treated, a bull which serves only one or two cows per day, if of full age, well fed and vigorous, may successfully serve 100 or more cows throughout the year.

Niagara County, N. Y.

FROM SMITHS, POWELL & LAMB.

We believe that cattle thrive better and are more healthy, and that their progeny are more apt to be vigorous when they have regular exercise every day, and this they can get in no more natural way in summer than by running in the pastures. We would not advise this inquirer to allow his bull to run in the pasture with the cows; but he should have regular exercise every day. We have no knowledge from experience bearing on the point which is raised; only in a general way we would not anticipate as good results from a bull from stock that had been soiled for years, as we would not expect him to be so vigorous and prepotent as a bull from stock that had enjoyed the benefit of more exercise.

Onondaga County, N. Y.

FROM C. M. WINSLOW.

The tendency of all stock is to revert to nature, and as grazing is the natural way of feeding, and as soiling is comparatively a modern method of doing so, I see no reason why stock, if taken young and subjected to the original and natural method of feeding, should not thrive. I do not think there is enough difference in the two methods of feeding to have any effect on the offspring, if another method is adopted before the calf is himself subjected to the soiling plan. It is possible that an animal that has had food given abundantly to it for a long period, would, if a change were made, fall away for a while, until it became accustomed to providing for itself, and a man would be liable to suffer loss in buying such stock; but not if he began with the calves.

Rutland County, Vermont.

FROM MILLER & SIBLEY.

Our experience in relation to the soiling of cattle and its effect on the progeny has not been sufficient to enable us to answer the question with such a degree of positiveness as would make our opinion of much value. The whole question to our minds would form itself thus:

What has been the treatment of the animals under the soiling system? Have they been allowed an abundance of fresh air and ample exercise? If such has been the case and the herd from which the animal came was of a strong-constitutioned class, we would have no more hesitation in purchasing such an animal than we would (other conditions being equal) in purchasing one from a herd where ordinary methods of feeding were followed. We are all disposed to look at any question from one stand-point and not from all sides. A person selecting a bull for which he pays more than an ordinary price should carefully examine the family history and characteristics of the strain from which the animal sprang. He must consider the individuality and external evidence of constitution as well as historical evidences of the same and all the minor questions which go to make it apparent that one animal is more desirable than another.

Venango County, Pa.

FROM M. P. ROWE.

I have never had experience with bulls that have been soiled altogether, and which have not been allowed to run out in pasture, but the general impression is, (and my observation confirms it) that neither bulls nor stallions that have been so treated, and which "have had comparatively little exercise," are as sure for breeding purposes as are those which have been otherwise treated. Should the RURAL'S correspondent, however, procure a bull calf bred from cattle that had been altogether soiled, and never pastured, and should he raise him under different conditions, I do not think that any defects his ancestors had acquired *from their mode of keeping* would be inherited by the calf.

Spottsylvania County, Va.

FROM H. B. RICHARDS.

Calves bred from a male kept in confinement without exercise are generally small with weakened constitutions. If the dam also be confined and have insufficient exercise, the tendency will be the same. Inactivity on the part of the dam will make the offspring sluggish. Nothing will compensate for exercise, and breeding for a few generations from stock fed in this way must result in loss of vigor, activity and constitution, and the animals will not be adapted for the changes of out-door climate or for pasturing and reproduction.

Northampton County, Pa.

Miscellaneous.

CORRESPONDENTS' VIEWS.

POISONOUS POTATOES.—Ordinarily the potato is one of our most healthful articles of diet. With the addition of a small proportion of other food it has more than once been the barrier between the Irish nation and starvation. Several years ago, when on a visit to the famous island of Iona, I was told that the failure of the potato crop had compelled over half its population to emigrate. In our own land among the great variety of vegetables with which we are blessed this is the one most universally used and the last to be spared. Still we must not overlook the fact that healthful as it is, and acceptable as is the potato to our palates, with its floury richness and agreeable flavor, yet it belongs to a family that includes among its members belladona, tobacco, stramonium and henbane, some of the most poisonous plants known to man. Its relationship to these can be recognized in the intense bitterness left in the mouth when we taste the cellar-grown sprouts, or that portion of the tuber which has been made green by exposure to light. Last season was a very peculiar one for all vegetable growths and the result of this is strikingly seen in its effects on the quality of a potato raised in some localities. These appear all right to the eye, but when cooked are found not only to be deficient in the dryness and good flavor we so highly esteem in this vegetable, but they leave a bitter taste in the mouth and cause a burning or smarting sensation in the throat. When such results follow from eating them, we may be sure that a poisonous element has been developed in the tubers and that they are no longer healthful human food.

Marblehead, Mass. J. J. H. GREGORY.

I COMMENCED TESTING GRAPES in 1884. I hoped to be able by this time to report a number of facts relative to the many different varieties which I have, numbering over 230; but I find that facts of one season may not be facts the next, and I have hesitated, and still hesitate, to make public the results of my experience, as my notes are apparently very contradictory. I hope to have something to say later. I left a bunch on a Mary vine until October 22, and although we had had several severe frosts, there were no signs of rot; the berries adhered firmly to the peduncles and were but slightly shriveled. The Mary may be the same as the Lindley, but it does not appear so from my experience this season. It fruited for the first time. UBER.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

IF we talked only when we had something to say, and then said it in the best and simplest words in our vocabulary, we would add a good deal to the value of our conversation. We meet plenty of talkative people, but few good talkers. One of the greatest troubles is that we are apt to talk to interest ourselves, rather than to interest others.

* * *

WE think it a great mistake so to repress children that they are never allowed to join in the family conversation, but it is a mistake of equal magnitude to let them interrupt the conversation of their elders. But it is well when they interest themselves in sensible or instructive talk. The chief disadvantage of repressing children is that it is apt to render them awkwardly bashful when older. There is no doubt that bashfulness is usually the result of excessive self-consciousness which is, after all, but a form of vanity—one who talks to interest others without considering himself, is never bashful.

* * *

WE expect most of our talking to be done by women, and it is really necessary that our girls should practice the art. To begin with, the voice should be agreeable. Harsh tones must be modified, clearness of utterance cultivated, and one should try to attain

"A low, sweet voice,
An excellent thing in woman."

The language should be carefully chosen. Now, we abhor any affectation, and we do not admire the young lady (she would feel hurt if you called her a young woman,) who always says she "resides" at so-and-so, rather than that she lives there, "retires" when she goes to bed, and whose language is best described by "genteel" that poor old word that has been abused until it is really vulgar. Never be ashamed of talking plain English, but never abuse it by using vulgar catch-words or current slang. Thackeray said that there was gentlemanly slang as well as vulgar slang, but the two are so inextricably mixed that it is difficult to tell one from another. So it is best to avoid either. If girls knew the abominably low origin of many slang phrases that they so glibly repeat, we think they would utterly abjure them in disgust. One may use pungent, expressive speech without approach to slang.

* * *

THEN there are words which are not slang, yet are objectionable and incorrect. Take, for example, that most terrible of all Americanisms, "pants," or its accompaniment, "gents." Some purist declares that only a "gent" would wear "pants;" and indeed the two words seem to go together. It is just as easy to speak correctly, and say trousers, as to use the more objectionable word. Even such a woman as Mrs. John Sherwood, considered an authority on good breeding, is guilty of using the word pantaloons when she means trousers, and though this word is not really incorrect, it is certainly inelegant.

SOME ultra-modest people really give an offensive turn to their conversation simply in the effort to be very correct. For example, we know so many who always use the ambiguous word limb when they mean leg, and though it may be meant in all simplicity it does sound a little absurd. But in this one must be governed both by taste and surroundings; it is well to call a spade a spade, but there is no need to make a spade or anything else too obtrusive.

OUTINGS IN NEW ENGLAND.

IX.

MARY WAGER-FISHER.

A little ride from Nantucket—one can go by rail—is Sconset (Siasconset), a miniature village of fishermen's cottages of the quaintest description. Here, after a storm the surf rolls in 50 feet high, and is both magnificent and fearful to contemplate. While the surf on this side of the island is so great, one may bathe on the opposite shore in water as calm as an unruffled mill-pond. In the days of Nantucket's commercial prosperity from two to three hundred large vessels were owned here, but now scarcely a vessel of any rig lies at the wharves. That the island should be eminently "healthy," with a fine temperature, is readily understood, and it is a scrap of the world quite free from pretentious people and from the newly rich. It is quiet, comfortable, aristocratic and very enjoyable for the best class of people. Indeed the entire New England coast from Maine to Connecticut, inclusive, with its bold shores, its wealth of islands and of bays, both large and small, is one long stretch of beauty and every spot has its own charm and attraction.

From Nantucket we sailed to New Bedford across Buzzard's Bay, nearing the old-time whaling town at sunset, and the view of water and shore, of islands, villas, boats and shipping bathed in the twilight colors, was exquisitely beautiful. New Bedford is a wide-awake city, with handsome stores, and public buildings, and beautiful elms. I noticed on the doors leading into the waiting rooms at the Old Colony Railroad Station, a fine new building, the simple words "Men" on one and "Women" on the other—two brief words stripped of all unnecessary verbiage, which gave all the information required. From New Bedford we had a delightful ride by rail on to Providence, Rhode Island. We saw, *en route*, what we had never seen before, a forest that had been felled by fire, the fire working in the peat underground and burning the roots off so that the trees toppled over. There is very considerable both of beauty and interest in Providence, but our visit had for its principal object the museum of Brown University. There are museums and museums, which suggest catalogues of birds and stones, but this one of Brown possesses great originality and is well worth a visit even from museum-satiated travelers. To me among the most interesting relics in it were the "remains" of the body of Roger Williams, that most liberty-loving, sane-minded young parson, who after being driven out of Massachusetts, made his home in Rhode Island, and called the place Providence, "because God had provided for him." Some few years ago, it was deemed proper to look after his mortal remains with increased care, when it was found that his body had already been resurrected and had ascended into an apple tree, which had grown near the head of his grave, the roots having absorbed the body, following the outline of it, the legs, knees, feet, etc., then continued on into another grave. So that these apple tree roots and a few bits of nails that were in the coffin, are all that are left of the contents of Roger's grave, and these preserved in a glass case belong to the museum. The Memorial Hall of Brown University was built by Mr. Sayles, whose son died while in college.

From Providence we had a charming sail down Narragansett Bay to Fall River, where we spent one Sabbath. Here too, the death of a son had resulted in a memorial building, a superb structure costing a million of dollars and devoted to education—the Durfee High School, built of granite, and supplemented with an endowment of a million dollars—the gift of a mother whose only son had died at 23 years of age. Every day she drove to his grave to cover it with flowers—the one poor little comfort left to her.

Presumably, like all other strangers to Fall River, I had thought of it only as a city of enormous cotton mills, and tenement houses of operatives. True, the great mills are there, high, long buildings, full of windows, looking prosaic and utilitarian to the last degree. But the greater part of the city is very attractive, built on a bluff commanding beautiful water and shore views, and rich in charming and costly houses. We attended the Central Congregational church—New England is the home of Congregationalism—an edifice spacious and beautiful, and filled with a congregation elegantly garmented. One cannot but wonder, the country over, where so much money comes from for fine apparel.

In writing of Middleboro, in a former letter, I neglected to mention an interesting statement made to us concerning the acoustic properties of buildings. We were taken into a church of which the acoustics was perfect, and of which the proportions were, width half the length, and hight half the width—a bit of information which may be of value to unscientific builders.

From Fall River we sailed for home and our first New England summer outing was at an end. It was the middle of September, and Anaximander said with a business air, "Courts open." "School begins;" said the laddie. "Peaches and tomatoes to can, and the fall house cleaning," sighed madame.

CITY vs. COUNTRY BOYS.

J. H. G.

NOTHING could be further from the truth than the feeling so prevalent among country boys—that farmers' sons have no chance in the "race of life." The fact is, the men who are leaders in both mercantile and professional life were, as a rule, brought up on a farm. It may be said with truth that their success depended upon the fact that they left the farm and entered college or business life. It will be found, however, that the men who have achieved the greatest success are those who did not leave the farm until they had acquired the habits of industry and frugality which can be learned nowhere else so well as on the farm. A model course of training either for the professions or for business would be 20 years on the farm and 10 years in college or in acquiring business experience. The Office says that country boys have no conception of the advantages they possess over their city cousins. For the most part the idea seems to prevail that the city boy has all the opportunities, while the country boy has only privations and disappointments. And yet, when we come to look the business of the city over, we find that among the successful men those of city birth and training are in the minority, while those who spent their boyhood in the country, and commenced the race apparently handicapped, are in the majority.

New York City is a striking instance of this fact. The merchant princes, so called, and the railway magnates, as they are commonly termed, together with the bankers, brokers, lawyers, doctors, manufacturers, judges, editors, inventors, and accountants, with hosts of others too numerous to name, who have achieved the most distinguished success in their special fields of labor, are not, as a rule, New Yorkers by birth and education. The leading men, with very few exceptions, in all the walks of life in the metropolis were educated outside of the city, and not a small proportion of them were country boys a very few years ago. The reasons for this are not very hard to discover. In the first place, the procession of events before the gaze of a city boy is so rapid that he has no time to seize upon any one thing for himself. If it be only a book or a paper that comes in his way, it is not prized, because of necessity it must make way for its successor of the morrow. Again, business is conducted on so large a scale that as observer or apprentice he can only become acquainted with a subordinate part. He seldom has the opportunity to study a given business in its entirety. Opportunities for amusement are so many, and the habit of indulgence formed in childhood is so hard to break, that much valuable time is lost in that direction; and so we might go on enumerating many other things equally unfortunate for the training of the city boy for the active responsibilities of a successful business.

Last, but not least, the average city boy has not the physical stamina that hard work, the only method of attaining success in the business world, so imperatively demands. On the other hand, the country boy has leisure. He has few amusements, and he prizes, and therefore studies, the books and papers that fall in his way. He finishes one thing before he takes up another. If he learns any business while in the country, it is one so small in extent, and of so few details, that he comprehends every feature of it. If he has decided ability for management, it is not at all strange to find him in the direction of affairs long before his city cousin of the same age has left school. He early learns self-reliance. As a rule he is of robust health, and, having been thrown upon his own resources, he is not abashed when some unexpected difficulty is encountered in his business career. But, beyond all else, he has been trained to work continuously the year through. He has fixed habits of industry. Accordingly, when he comes to the city to live, the odds are largely in his favor, although it is very possible that neither he nor his city cousin appreciates the fact. The very belief, however, that he is at a disadvantage in the race causes him to make greater effort, and ere long he finds himself away ahead of all competitors.

REALIZING TRUTH.

OLIVE E. DANA.

IN Mrs. Whitney's "Sights and Insights," when the travelers whose experience we share are comfortably established on the ocean steamer plowing its way across the rolling waters that separate and unite the continents, she puts into the mouth of Emery Ann the characteristic words:—"It makes any one realize their geography, don't it?"

I suppose there is no experience that should not make us "realize" some b fore unapprehended fact as truth, or principle. There is no gift a teacher might better covet and cultivate than this—of making real to her pupils the lessons of the school-room, that the truths they receive may become realities in their lives. Is there not here an essential difference between teachers, even between successful teachers?

We all know so many things confusedly and superficially. There is so much we have heard and read which seems familiar, yet of which we have no definite, thorough, trustworthy knowledge. "Reading maketh a full man;" said the quaint old writer. But fullness does not imply thought or vigor or acumen. "Speech maketh a ready man;" but readiness is not, we know too well, synonymous with accuracy. "Writing," he concludes, "maketh an exact man." But not even to the exact man are facts always realities. To some they are fossils, quaint and precious; to some, tools; to some, living buds, which, as in the poet's song, flower into beauty.

The vagueness and unreality of our knowledge may be due in part to a lack of early discipline. Here is the teacher's opportunity for the new generation. And these faulty mental habits of inattentiveness and lack of "grip" we have allowed to fossilize. We have indorsed these habits so often that we cannot repudiate them at will; they are a part of ourselves.

All the best influences of modern education are tending to furnish the scholar, and therefore the coming man and woman, with real knowledge, real skill, real motive and inspiration for the life-work that is among rugged realities. The child's education is begun among real things, he is taught to number, to use, to measure, to make real things. And for the older student, the pebbles, the plants, the stars, are some of the pages in his text-books. And perhaps, too, the youth or maiden is lured to the carpenter's bench or the cooking class as a part of the curriculum, before he or she can graduate from the school-room.

It has been said, and not without reason, that "the effects of the school are apt to fade away on the farm and in the factory, and a separation, if not an antagonism, often takes place between study and daily life." We need a bridge to carry the scholar with his habits of study and inquiry safely into the life of profitable labor, without obliging him to drop what he has taken so much pains to gain.

It is wont to be true of men who have won for themselves, in the teeth of obstacles, success, fame, wealth and the education or training preliminary and attendant upon that attainment, that their knowledge was obtained by real struggle, by virtue of real, felt need, was sought, assimilated, used. It is a part of their life, not a shadowy abstraction; not a recreation or accomplishment. And it is urged that women fail too often from lack of definite and accurate information and grasp of facts and principles, more often, perhaps, than from any other cause. They have come short of that ownership of truth, which is their prerogative. But there are other things besides geography and physics that we need to realize. More than a thorough and familiar acquaintance with history and literature, will it avail the pupil, when he or she is a man or woman, to realize the worth of truth and loyalty; of sincerity and nobility; to appreciate the value of kindness; to know that there are grander things to strive for than wealth or comfort or fame.

Ah! what tides of worldliness, what waves of care, what billows of trial, what winds laden with all potent and insidious temptations, must beat upon all souls in the commonest ways, the most prosaic occupations, the most sheltered lives! We need a strong grip on certain actual truths and principles, a firm faith in God, and earnest aspiration, and unfailing love. These things cannot be too real to any of us. And we can never do much toward a thing real to others until it is intensely real to us. The best teaching is a sharing. The reason why some teachers succeed so much more nobly than others in these directions, may be that they but give more freely of their own more abundant life.

GOLDEN GRAINS.

Count the mercies, count the mercies!
Number all the gifts of love;
Keep a daily, faithful record,
Of the comforts from above.
Look at all the lovely green spots
In life's weary desert way;
Think how many cooling fountains
Cheer our fainting hearts each day.
Count the mercies! Count the mercies!
See them strewn along our way!

—*Mrs. M. D James.*

LAVATER says that everything may be mimicked by hypocrisy but humility and love united. The humblest star twinkles most in the darkest night. The more rare humility and love united, the more radiant when they meet.....

No man or woman, says Phillips Brooks, of the humblest sort can really be strong, pure, and good, without the world being better for it, without somebody being helped and comforted by the very existence of that goodness.....

THE true ideals and standards of life; says the Sunday School Times, are, in one sense, always unattained; though, in another sense, they are never unattainable. They are as the shadow of a man's head when the sun is low behind him. He marks where that shadow is, leaps toward it, and alights upon the spot where it lay. But the very effort to reach it has thrown the shadow still farther forward. So of our ideals. We reach the point of a past, and only a past, ideal; but the very act of reaching it throws the present ideal still farther forward. A man who considers that he has reached his present ideal is a man practically without an ideal, and therefore without the power of high accomplishment.....

THE HOME-MAKER says that the best of us make mistakes, and what wonder is it that our boys, with their high spirits and their ignorance of the world, blunder and get into scrapes pretty often? But it is a cause of rejoicing if either father or mother can get hold on a young heart which leads it to them to open its worst recesses to their loving eyes....

ADDISON said that irresolution on the schemes of life which offer themselves to our choice, and inconstancy in pursuing them, are the greatest causes of all our unhappiness ...

THE GOSPEL BANNER tells us the petition of a colored boy who was appointed to lead the prayer-meeting, "O Lord, I pray thee make thy servant conspicuous," expresses the feeling not seldom manifest among those who serve in that office and who are supposed to be better qualified than the untutored colored youth. When self is obtrusive the leadership is not so helpful as is desired in any service.

EASE, says the S. S. Times, signifies waste power, or, at least, strength unused. Generally, he who does any thing easily is doing less than his best. Not until we feel the burden of overcoming a difficulty can we know that we are doing as well as we might do. It were better to have it said that you write well than that you write easily; for though you may write comparatively well with comparative ease, it would be a greater achievement to write better with comparative difficulty.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

Heed how thou livest. Do no act by day
Which from the night shall drive thy peace away.
In months of sun so live that months of rain
Shall still be happy. Evermore restrain
Evil and cherish good, so shall there be
Another and a happier life for thee.

—John G. Whittier.

EXTRACTS FROM SUNDAY-EVENING TALKS AT THE RURAL GROUNDS.

THERE is nothing lovable in a person who yields to every whim and fancy, and places himself at the head of all creation. It is only those that live for others that are reverenced and looked up to in this world. I came across this stanza in the Proverbs the other day. "Better is a dry morsel, and quietness therewith, than a house full of sacrifices with strife," and it instantly made me think of a mistake I am constantly making. Whenever I make a sacrifice I am sure to upset it by a long face, a complaint or, if not that, I am so cross afterwards that I destroy any good that it might have done me or any one else.

* * *

THE following little incident was told me by one of the college boys at home. When he left his home to attend college, his mother, in packing his trunk, put his Bible (one that she had given him) down at the bottom with a $10 bill in it. She thought in this way to find out whether or not he made a practice of reading it. Well, at the close of school he returned home to spend the summer vacation. His mother went to his trunk, got out his Bible and found the $10 bill still there, and just where she had placed it.

* * *

We are so constituted that labor of some sort is essential to health, and health to happiness. *There is no such a creature in existence as a* HAPPY *indolent man, woman or child.* There is a *kind* of inactivity, often mistaken for indolence, that is the effect of a feeble physical system. Such persons are *entitled* to sympathy though they receive little.

But the genuinely indolent man is entitled neither to help, consideration nor respect. God helps those who help themselves. Else what did Christ mean by the parable of the talents? I look upon those as being the offers of just so many hobbies. Will you ride? The man who returned his one talent which he had carefully stored away did not *ride*, and his master well rewarded his indolence.

We *must work to* be happy. If you can work with a *heart*; that is, if you *love* your work, that work brings you joy. It becomes a pleasure. The affectionate mother who watches over her first-born babe night and day, has a *hobby*. Could you induce her (if she be a *true* mother) to give up that work?

All *worthy* hobbies are of this kind. They *absorb* us; we cherish them; they are the last thought that rests in our mind as we go to sleep—the first that flashes upon us in the morning. We have an *aim in life*. We are ready to hasten dressing; to hurry up the meal so that more time may be given to the hobby.

Why is work a punishment? Simply because it is not in accord with our tastes. To *me* mercantile life is hateful. To the so-called merchant prince it is glorious. To *me* practicing upon the piano for four hours daily would be a *severe* punishment. To Miss —— it may be a pleasure. The practice of surgery to many is a pleasure-giving profession. I couldn't amputate a leg or remove a tumor if I were to die for the failure.

It is plain, therefore, that devotion to our work brings happiness. Let us see to it, therefore, that we endeavor to choose our work wisely; that we endeavor to guide our children so that they can determine what kind of an occupation they may take an interest in or make a hobby of. It is the hobby-rider, my friends, that does the most good in this world, and he experiences the most happiness as well. God never intended that any one man should excel in all things. He did not so constitute us. Our mental powers are too feeble—our lives too short. Newton, Darwin, Pasteur, Edison, and all who have served mankind faithfully and well were *specialists* —merely another name for hobby-riders.

Give me the earnest, persevering, vehement nature, and I will show you a hobby rider. He may ride well or ill. That depends. We may have vehemence without brains or conscience. In the one case he will probably run his horse into a ditch; in the other to the devil. Children, with hobby-riding proclivities, or vehement natures, are just the ones that need the most careful guidance from parents, since they are inclined to persist in evil as well as in good projects. This is a view of the subject that would need a separate consideration. The fact still remains that if we would enjoy the greatest amount of happiness; if we would accomplish the greatest amount of good in this world, it must be through *persistent* work into which the heart as well as the head and hands enters Let us never forget that *pleasure* is simply agreeable labor. There is absolutely no such thing as pleasure or happiness without an *effort*—and an effort *means work*. The more the affections are engaged in the work, the less arduous it becomes. From this point of view parents cannot be too careful while rearing their children not to place before them work for which they are not fitted; work against which they may reasonably

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria
When she became Miss, she clung to Castoria
When she had Children, she gave them Castoria

rebel. Better by far that the same time be spent in guileless play. Let their natures develop vigorously. It is in accord with natural laws that children should, in great part, choose their own pastimes. Guided by wholesome study, later years will develop the earnestness of purpose, which we may hope will seat them on a sound hobby *that they may* safely and with benefit to society ride through life.

HANDY.

WE have recently hung up a slate and pencil in the kitchen for putting down items needed from the store.

Orders are taken and goods delivered on Thursday of each week. A treacherous memory sometimes causes a clog in the domestic working, but now when an article is needed it is at once placed on the slate, and taken off from our mind. It is handy. We have also grown tired of running upstairs or going without, when in need of a pin in the kitchen. A small pin-cushion suspended just above the kitchen table now supplies us.

Just such little contrivances prevent friction, and friction you know, good women, wears and tears and ages.

STARCH, AS MADE AND USED BY A MAN.

WHILE reading the columns of starch lore in the R. N.-Y. of April 6, the writer was forcibly impressed by the fact that enough labor, time and worry are annually lost by each housekeeper in handling starch, to raise $100 worth of fruits and flowers.

This is made less surprising when one considers that the great diversity of methods offered by the writers exhibits a total lack of any certain knowledge of the subject. However, since all the conditions influencing it are uniform, and are under one's control, it is apparent that the work should be governed by uniform rules. The women have done well in the effort to help each other, though the writer believes that each would-be helper benefited herself most in the attempt to help her neighbors.

Since every woman and her mother have for a thousand years starched and ironed various things variously, no two alike, though all striving to the same end; and since not one woman in 1,000, though possessing the requisite strength, can get, or keep after getting, employment in one of our large laundries, it is strongly suggestive of prejudicial influence exerted by former radically wrong methods. In California there are two laundries that employ, each, on an average, 200 hands. The stock of those companies is at or above par. *Do they know how to starch and iron?* Numerous visits to those institutions, with notebook in hand, enable the writer to give the general principles employed by them—besides, he can do the work himself. Some things must be understood, or, at least, accepted as facts; then when you have the principle and know the rules—the details being left to you—you will succeed if you have tact, courage and muscle; if you have not these requisites but have the knowledge, you are still helped.

It is the starch more than the cloth, that is to be treated, the cloth merely holding the starch while you punish it. Starch alone is all that is needed to make a shirt-bosom as smooth as a mirror—you probably know how that looks—and as stiff and "springy" as a carpenter's saw. It is nonsense to try to work a body of starch into a fabric already loaded with water—dry the goods. A small amount of suet is sometimes added to the starch while cooking, to make the work easier for green hands; but as it sometimes causes a blister, when a little too much is added or when it is not properly mixed, it is unsafe; besides, it is not needed for a good ironer. A capable man will iron and finish from 60 to 125 shirts a day; but though he could do 500 he could not polish one with a common iron. The "polisher must be very hot, and run very fast with heavy pressure. Ironing and polishing shirts is as hard work as chopping wood and harder than sawing it; so the wife had better get her husband to investigate the matter: the result would serve to illustrate some of the trifles that women do. A polished surface will wear twice as long as an unpolished one without becoming soiled; but if you want whiter and neater-looking linen just dampen it slightly after it has been polished and dry it with a common iron. Now mix the required amount of starch with a little cold water; then after taking out a-fourth of it, cook the remainder about 15 minutes; remove it from the fire, and when slightly cooled add the rest. The added starch should whiten the mass just perceptibly, and the starch should then be as thick as you could work or wring it into the cloth. While the starch is as hot as can be borne, turn the shirt-bosom, and grasping the body, around the bosom, with the left, use the right hand to work and wring in all the starch you can. Wring off the surplus, and turning the bosom treat it in the same way. Throw it on the table and hold it while with both hands you straighten the bosom and vigorously rub the starch into it with the "heel" of your hand. It is nearly smooth, and comparatively dry, so throw the bottom up on the bosom, and the cuffs on that and roll tightly, after which it may rest awhile, as this serves to dry it in a degree and absorbs the surplus starch. But since you did so good a job in the starching you need only wait to "get your breath," so get a seven-pound, or larger, iron, which must be hot enough to brown the shirt at once if allowed to rest on it. Unroll the shirt and straighten out the wrinkles, having the collar always to the left. Take it by the back of the collar and the center of the lower posterior end, and with a sort of toss outward and a draw toward you, the shirt's back lies doubled lengthwise. Be lively now, while you rub the hot iron over it, else you will scorch it. Pick it up by each end and turn, spreading the whole front up; and now your iron flies over that. Then to the sleeves. Your iron is slightly—only slightly—cooled now, so turn the cuffs wrong side up and run the iron, lightly the first time, then with pressure, clear across and back; repeat it, and change to the other cuff; then you may turn them right side up and finish them with about three long, heavy strokes forward and back for each. Now to the collar-band, and then to the shoulders, after which comes the "tug of war." If you have acted just right your iron is still hot enough to smooth the bosom, but I fear you have been a little slow and awkward, so you had better get a hotter one—heat is essential. Get one as hot as you can use without burning. Take hold by the left shoulder and the center of the front flap and raise it up so that the uncut cloth of the back will lie under the bosom when put down, and lay the center line of the bosom on the edge of the table, the right half hanging over; since the wrinkles are partly smoothed out, there is no difficulty in gliding the iron—*lightly*—from bottom to top. Try it; better be compelled to dampen it again than not learn how to do it right. Again push the iron over it, this time with pressure; now fairly ride it up and down a few times, to make it solid; put it up on the table and treat the other half in the same way. Well, there; you have been but a fraction over eight minutes, and it looks like a "store" shirt: but if the work has been an item of importance you must economize by putting on a little more. As your polisher is just a little too hot to iron with, it is about right, so now push a hard, smooth board into the shirt under the bosom, and with a soft cloth dampen the surface of about one-fourth of the bosom—be careful there not to use too much water—now grasp the polisher firmly with the right, and, laying the left hand over it, put the rounded *heel* upon the cloth, throw on your weight and make the iron fairly dance crosswise over that bosom, finishing by long strokes up and down with the bottom of the iron. Good! At last it is a "thing of beauty;" and when your "guid mon" makes your cheeks red with praises you needn't tell him that you learned how 'twas done from

Downieville, California. P. H. R.

WASHING.

I WOULD like to give a few hints on washing, on points on which others in their abler articles have not touched, and to me they are such great helps that I want other hard-working women to try them. I soak my white clothes in hot suds over-night; in the morning, I rub them out slightly and after making suds of cold water I add two tablespoonfuls of spirits of turpentine to a boiler of clothes. Let boil 20 minutes and rub out of lukewarm water and rinse. The clothes will come out snowy and sweet-smelling without half of the rubbing. This treatment will not make the clothes tender and is better than any washing fluid I have ever used. The views expressed in the Special, about washing colored clothes in starch water, setting the colors of delicate prints with salt water, etc., are mine also, only I use bran in a coarse sack instead of flour, which answers the purpose equally well and is more economical. But in washing very dirty overalls, a job that falls to the lot of every farmer's wife whose husband raises large quantities of potatoes, I want to give my plan. I had just such a pair yesterday, firm, thick and stiff with dirt. Well, verily, the "spirit was willing, but the flesh was weak," and, like Samantha Allen, I "sithed a deep sigh" and went at them, but my weak hands and wrists refused to do the heavy work, so I got my scrubbing brush, (an ordinary one without a handle) and laying the overalls, a part at a time, on the washboard, I soaped them thoroughly and scrubbed them with the brush. The dirt could not stand that treatment and I came off victorious.

I heartily sympathize with "Farmer's Wife" in her detestation of the one-third law, while she earns one-half, but it seems to me that it would be better to economize with her remnants, making them go as far and look as well as she possibly can, in order that her one-third may be large enough to keep her from the Old Ladies' Home.

MRS. H. L. SKEELS.

THE flower bud may be perfect but without sunlight, without warmth and food, it refuses to unfold. So it is without the expanding influence of an education the mind blights—it brings forth neither flowers nor fruit.

A BATCH OF CAKES.

FROM the following recipe I made three cakes this morning, which proved to be very good: Three table-spoonfuls of butter worked into three cups of sugar, three well beaten eggs, three cups of sweet milk, six cups of flour through which I sifted six tea-spoonfuls of baking powder. Beat up well.

I first made a layer cake in three parts, between which I put layers of soft chocolate icing. The second cake I baked in a small round tin, intending to cover it just before it is eaten with sweetened and flavored whipped cream. To the third I added one-half cup of flour, and a cup of raisins. This may be spiced to taste. I think it less work to make the three cakes at one time than to bake at different times and I like the variety.

Another cake which the children think very nice and pretty is made in this way: Separate the whites and yelks of three eggs, saving the white of one for frosting. Add to each, well beaten, two-thirds of a cup of sugar, into which has been worked one tablespoonful of butter. Add to each one-half a cup of milk. Sift for each one-and-three-fourths cup of flour with one-half tea-spoonful of saleratus and one tea-spoonful of cream-of-tartar. Bake in layers, placing first a yellow cake, then a white to which has been added two or three drops of coloring, sufficient to make it a delicate pink. Place the white cake upon the top and frost. It cuts very prettily. The yellow portion should be flavored with lemon, the pink with rose, the white with vanilla. SUSIE E. KENNEDY.

Save the rose leaves. We dry the petals between sheets of unglazed white paper, having never been successful in putting them in jars with salt between the layers. We should be glad of information as to the best way of preserving the leaves for perfume jars and for flavoring extract.

News of the Week.

HOME NEWS.

SATURDAY, June 8, 1889.

AS WAS feared, the flood in Conemaugh Valley, Southwestern Pennsylvania, on Friday May 31, was far more disastrous than even the most woeful of the first telegrams announced. A week ago the deaths were estimated at from 200 to 500; now it is known that they cannot be less than 10,000 and may be over 15,000. It was the most terrible disaster that has ever occurred in this country. The population of the desolated valley—about 30 miles long by from a half a mile to over a mile broad, is put at about 50,000, and of these 12,000, mostly women and children, are dead, a greater loss than in any battle of the late war and a vastly greater proportionate loss than in any battle of modern times. Conemaugh Lake, the cause of the disaster, was 3½ miles long by 1¼ broad, and was an artificial formation made, first, by the State to supply the Pennsylvania Canal. After this was bought by the Pennsylvania Railroad, the reservoir was emptied and used as a grass farm for some years, then purchased and refilled by an association of Pittsburg sportsmen who used it for fishing purposes The embankment shutting it in was about 1,000 feet long, 90 feet thick at the base and 30 at the top and 70 feet high, and the water it contained at the time of the flood would have taken 26 hours to pass over Niagara at the ordinary rate, though it passed out of the reservoir in about an hour. It was supplied by the Conemaugh river, and was situated 14 miles above Johnstown, the scene of the greatest disaster. Before the bursting of the dam five inches of rain fell in the surrounding country and swelled all the emptying creeks into torrents, and a high wind along the lake gave impetus to the swollen waters. Twenty-five feet high the rolling, tossing wave swept down the narrow, winding valley carrying everything before it. It first struck and shattered South Forks (2,000 inhabitants); then Mineral Point (800 inhabitants); then Conemaugh (2,500 inhabitants); then Woodvale (2,000 inhabitants); then Johnstown, which with Cambria City and two adjoining towns, contained nearly 30,000 inhabitants. On the waters rushed down the valley laden with wreckage of all kinds and thousands of human beings, dead, or alive awaiting death or rescue. Sheridan (800 inhabitants) shared the fate of the upper towns, while all the farm-houses and farms between the towns contributed horribly to the general ruin. Live stock of all kinds in vast numbers, added to the floatage of the dead and the dying. House tops, trees, all kinds of floating supports were burdened by human beings of all ages, comparatively few of whom were rescued or escaped. The floating houses and other wreckage of the upper valley, on striking the fine, solid stone bridge of the Pennsylvania railroad just below Johnstown, were stopped and piled up 45 feet high over an area of 65 acres. The mass caught fire from over-turned stoves and it is thought that from 1,500 to 2,000 people were cremated. Some were dead, many caught in the ruins and others free but unable to escape except by plunging to death into the flood, which many did. The mass is still smouldering and hundreds of workmen are breaking it up; but it will probably require dynamite or fire to get rid of it and its confined hundreds of festering corpses. The actual number of the dead can never be ascertained. Some have doubtless been carried down along the Alleghany and Ohio rivers even as far as the Mississippi. Hundreds were cremated in the awful jam, buried deep in sand, or washed into inaccessible nooks and crevices, never to be seen by human eye. Pestilence threatens the valley from festering human corpses and animal carcasses. About 3,500 dead bodies have already been buried, and the work goes steadily on. Mud flats represent the sites of the greater portion of all the destroyed towns. Factories and workshops have gone with houses and farm homesteads. The whole section must be rebuilt. The Cambria Iron Works alone lost $7,000,000 in plant and material. Six or seven thousand men are now hard at work hunting for bodies, burying the dead, clearing away wrecks and preparing for rebuilding. While some of the most glorious examples of heroism brightened here and there the gloom of the disaster, numerous cases of selfishness and cruelty added to it. Ghouls, chiefly Hungarians and Italians, at once flocked from the neighboring country to rob the dead. Many of these have been lynched—shot, hanged or driven into the river and drowned. Thieves and idlers have been flocking in from all sides, but they are being arrested or driven out again. None are permitted to stay, except the workers and those who are known to belong to the place. Several regiments of State militia are on the ground, and more are ready to move there at once. Terrible rain-storms and disastrous floods elsewhere would have caused a tremendous sensation throughout the land were it not for the overwhelming nature of the Conemaugh catastrophe. All Virginia east of the Blue Ridge, the Potomac Valley, the mountain region of Eastern Maryland, all middle Pennsylvania, and the lake region of Western New York have grievously suffered from severe rain storms which ravaged villages, mills, railroads, and farms, causing the loss of millions of dollars' worth of property and hundreds of lives. At Williamsport, Pa., 65 people watching the awful floods of the West Branch of the Susquehanna, perished with the bridge on which they stood. There also $5,000,000 worth of timber and lumber was swept away, and enormous damages inflicted on the town and surrounding country. The total of human deaths in that section varies from 100 to 200. The deaths in Maryland and Virginia, singly or in twos and threes, are put at about 100; while those in Western New York are variously estimated at from 25 to 125. The losses in damages or destruction of mills, canals, railroads, bridges, houses, crops, live stock, etc., etc., are undoubtedly high among the millions. May has been the wettest month in the East in the records of the Signal Service ..... A big fire, Thursday, destroyed the lower part of Seattle, Washington Territory, and a good deal of the rest of the town. Estimated loss, $15,000,000.....The National White Lead Trust, an offshoot of the Standard Oil Company, has just purchased the plant of the Collier White Lead Company of St. Louis, for $4,500,000. This enables the oil monopoly to control absolutely the output of white lead in America..... .....The base-ball war goes merrily on. Yesterday morning the records of the two great national organizations were as follows:

LEAGUE.

Clubs.	Won.	Lost.	P. Ct.
Boston	24	7	.774
Philadelphia	21	13	.618
Cleveland	21	14	.611
New York	18	15	.545
Chicago	15	20	.429
Pittsburg	13	19	.405
Indianapolis	10	22	.313
Washington	8	20	.286

AMERICAN ASSOCIATION.

Clubs.	Won.	Lost.	P. Ct.
St. Louis	31	12	.721
Athletic	23	15	.605
Brooklyn	23	17	.575
Baltimore	20	19	.513
Kansas City	21	20	.572
Cincinnati	22	23	.500
Columbus	15	25	.375
Louisville	8	23	.258

After paying the freight over a much longer journey, steel rails from Chattanooga were sold the other day at Cleveland, Ohio, at much lower figures than those at which similar goods made in Ohio or Pennsylvania could be put on the market without a great loss. Northern iron works are ruthlessly cutting down wages on all sides to meet this Southern competition, but in vain it is hoped and feared.....The Michigan Central road was discovered last fall granting to a Chicago firm a rebate of three cents per 100 pounds on eastern shipments of wheat, which gave the firm so much of an advantage over its competitors and of course constituted a case of unjust discrimination under the law. The freight officials of that road will be prosecuted by the Inter-State Commerce Commissioners.....Wyoming Territory is now clamoring for admission as a State. Delegates to a Constitutional Convention to meet on September 2, will be elected on July 8. It has already population, wealth and intelligence enough to entitle it to admission..... The Canadians, the other day, seized the American fishing schooner Mattie Winship for poaching within the three-mile limit, off Cape North. She is to be released, however, on furnishing bonds in the sum of $3,500 to await the decision of the Courts..... There may be trouble in the Behring Sea embroglio. The Canadians say their vessels will hunt seals as usual, and that if they are captured by U. S. naval vessels, British vessels will recapture them. Our Government, however, expresses no alarm..... A convention is to be held at Chipley, Fla. on July 4, to concert measures for the annexation of Northwestern Florida to Alabama..... The memorial monument erected at Chicago by citizens in honor of the policemen who were killed by Anarchist bombs in the Haymarket riot, May 4, 1886, was unveiled the other afternoon..... The Northern Pacific Railway has just purchased the Northwest Central. This is looked upon as leading directly to the opening up of the entire Canadian Northwest. .... Eighteen St. Louis breweries have applied to the State to be organized into one corporation. This is one result of the new anti-trust law, which seems to be forcing rather than breaking up monopolies .....It is estimated at the Treasury Department that there has been a decrease of $8,000,000 in the public debt during the month of May, notwithstanding the disbursement of nearly $12,000,000 during the month on account of pensions. The Treasury surplus is now stated at $54,000,000.. ....A new compulsory education law has been enacted in Illinois, which seems to be generally regarded with favor, save only by the private schools that teach in a foreign language..... The whole country is responding to the cry of distress from the Conemaugh valley with glorious generosity, and several European countries are forwarding liberal contributions and collecting more. Down to Thursday evening the following cash contributions for the Johnstown sufferers were made:

Philadelphia and vicinity	$515,212
New York and vicinity	513,000
Pittsburg	275,000
Through Governor Beaver	210,000
Chicago	90,000
Boston	50,000
Cleveland, O.	42,000
Massachusetts Legislature	30,000
Washington, D. C.	30,000
Columbus, O	23,000
Baltimore, Md	16,000
Bethlehem, Pa.	15,000
Lancaster, Pa.	13,169
Cincinnati, O.	12,000
New Hampshire Legislature	10,000
Scranton, Pa.	9,500
Paris, France	9,000
Wilmington, Del.	6,700
Chester, Pa	6,000
Allentown, Pa.	5,500
Wilkesbarre, Pa.	5,000
Easton, Pa.	4,600
Indianapolis, Ind.	3,500
Chattanooga, Tenn.	2,721
Denver, Col.	2,500
Toledo, O.	2,000
Savannah, Ga.	1,700
Kansas City, Mo.	1,500
Charleston, S. C.	1,500
Chambersburg, Pa.	1,000
Carlisle, Pa.	1,000
Total..	$1,908,112

The Massachusetts grant is said to be unconstitutional and therefore unavailable. Nearly all the above sums are the results of a spontaneous movement. Churches, theaters, etc., etc., are preparing to contribute liberally, and the Pennsylvania legislature, and perhaps those of other States will probably make special appropriations for the sufferers. The money loss throughout the valley is estimated at all the way from $35,000,000 to $60,000,000, and as there was no insurance against water, the loss is a total one..... It is charged that execution by electricity is against the Constitution which forbids "cruel and unusual punishment." The Supreme Court in this State having decided that it is constitutional, an appeal is to be taken in the case of William Kemmler now awaiting execution in Auburn Prison.....A federation of the associations of locomotive engineers, railway brakemen, and firemen has just been effected in Chicago. Conductors and other railroad employées are expected to join ere long.....Negotiations are now being carried on at the Rosebud Agency, South Dakota, between the Sioux chiefs and the U. S. Commissioners with regard to the purchase of those 11,000,000 acres of the Sioux reservation by the General Government for the purpose of speedy settlement. The reports that squatters are occupying the country are officially contradicted. Numbers are, no doubt, secretly going through the territory to find out the best locations so as to be able to seize upon them at once when the country is thrown open to settlement, but no considerable number will "squat" there..... From the first opening of spring there has hardly been a working day which has not witnessed the inauguration of one or more strikes among workmen in various parts of the country. These have been most numerous in the strongly "protected" industries, and in nearly all cases they have been due to attempts to cut down wages and consequent resistance by employées. Machinery in this country now does the work of 500,000,000 men, we are told, and with the large natural increase in our population and the enormous immigration it is hardly surprising that there should be slackness in human employment, especially as the annual increase in machine-power greatly transcends the increase in hand power from all causes..... Both houses of the Connecticut legislature have passed a bill forbidding railroads to issue free passes to members of the legislature, and ordering the Controller of the State to furnish railroad tickets to every member of the legislature who may make him an assignment of his mileage.....The Massachusetts Senate has passed a bill authorizing the Bell Telephone Company to add $10,000,000 to its capital..... Judge Gray, of the U. S. Supreme Court and Miss Jennie Mathews, daughtee of the late Stanley Mathews, were married at Washington Tuesday afternoon..... The Illinois Legislature has passed a bill designed to restrict the circulation in that State of "flash" papers. It makes it unlawful to sell, lend, or give away or otherwise distribute to any minor any book, magazine, pamphlet or newspaper devoted to the publication of criminal news, police reports, or accounts of criminal deeds; or pictures and stories of deeds of bloodshed, lust or crime..... Senator Brown, of Georgia, is seriously ill. In case of death, Governor Gordon is sure to succeed him..... Jacksonville, Fla., is again unfortunate——60 buildings were burned Wednesday morning; loss about $200,000.. Governer Hill, of New York, has vetoed the Vedder Bill taxing sales of intoxicants, and the Crosby High License bill. Great discontent among those who want a legal check on indiscriminate rum-selling.....The Massachusetts House has rejected a bill for the abolition of the poll tax as a prerequisite to voting..... Three arrests have been made in Chicago in connection with the murder of Cronin. It is supposed that the actual assassins were imported from other sections, but the men arrested, and others to be arrested had a guilty knowledge of the crime, or aided in one way or another in causing it. One of the "clans" or branches of the Clan-na-gael, a "physical-force" secret society founded in 1872 as the successor of the Fenian Brotherhood, appears to have passed sentence of death on the man, ostensibly on the ground that he was a British spy, but really because he persisted in charging some of the leaders with the misappropriation of $84,000 or so. The society, of course, indignantly denies any connection with the murder.....

It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, June 8, 1889.

IN England, the Parnellite trial still drags uninterestingly along. Nearly all interest ceased with the proof of the forgery of the letters on which the charges of the Times were mainly based, and since Parnell himself left the witness-stand there has been little public interest in the matter. The court, which has evidently been all along against the accused, as its organization originally indicated, appears determined to drag the case out till the public shall have forgotten the Pigott fiasco. Gladstone is "stumping" the country now in favor of Home Rule, and says he is confident of ultimate success. There's a good deal of doubt, however, as to the scope of his Home Rule at this moment. Labor troubles are prevalent in every industrial center. Continental countries are competing closely with English manufactures in the markets of the world, and while the manufacturers are unwilling to cut down their own large profits in the least, they insist that the business situation demands the cutting down of their workmen's starvation wages from 10 to 25 per cent. Hence strikes, lockouts, etc., etc., etc.! .....Last Wednesday the Duke of Portland's three-year-old colt, Donovan, bore off the "blue ribbon of the turf" by winning the Derby race of Epsom, 12 miles from London, in 2.44 2-5. He was the favorite since February. He had already won $165,000 as a two-year-old, so that he has now cleared about $200,000 in winnings alone, and he stands to win a lot more. The Duke is "a very good young man" who has just contracted a marriage engagement with one of England's most beautiful daughters. He is also one of the richest men in the country..... ..... In France the great International Exposition still holds the field. All other movements are subordinated to its success. Political agitation is temporarily silent and even Gallic vaporings for "revenge" are for the moment hushed, lest the number of visitors should be diminished, for every one of them must leave behind a rich profit to French and especially Parisian hotel and shop keepers, etc., etc., and no nation on the globe is more covetous of the Almighty Dollar than the French. Hitherto the show has been a brilliant success. The daily visitors have been fully twice as many as at any previous exhibition of the kind, and the receipts have been correspondingly large. The present session of the Chamber of Deputies will end in a few days, and the general election will not take place until after the close of the show, in October. Then Boulangerism will probably once more become rampant, and the various other factions will enter into fierce and vociferous conflict..... Of late years the Argentine Republic, South America, has been making great efforts to induce immigration by offering free homesteads and free or assisted passages to all new-comers. Last year fully 400,000 immigrants responded to these tempting offers and now the Republic is forced to put a check on the inrush, as all the eligible public land is being rapidly taken up and there is a great amount of compulsory idleness in the country. The immigrants have been chiefly from Italy, but within the last few years Great Britain, France and Ireland have contributed liberally.....The Venezuela government, too, offers to pay the expenses of laborers going from Italy to that country for the purpose of cultivating the ramie plant. For each adult laborer it will pay $23.08, and $11.54 for each minor laborer.....Following the example of the anti-dressed beef movement in this country, the butchers of Paris are asking the French government to stop imports of dressed beef and mutton from Germany and Belgium; and the French Chamber of Deputies has voted to legislate on the matter at once.....

AGRICULTURAL NEWS.

SATURDAY, June 8, 1889.

THE Chemung County, N. Y., Agricultural Society will hold a fair at Elmira on the State fair grounds, June 18 to 21. George B. Smith, Horseheads, secretary..... ..An inter-State fair is to be held near Elmira, N. Y. September 17 to 27, $100,000 have already been pledged; the railroads will give reduced rates. Geo. M. Robinson, secretary, Elmira. .....The spring meeting of the Pennsylvania State Board of Agriculture will be held at Brookville, Jefferson County, June 12 and 13. Excursion rates on Pennsylvania railroad; particulars of T. J. Edge, secretary, Harrisburg .. ....The Columbus, O., Horticultural Society will hold a strawberry meeting on the University grounds, Columbus, June 16, at 2.30. The literary exercises will consist of papers in answer to the question: "What is the strawberry?" from the epicures', entomologists' and nurserymen's stand-points.. One county in Missouri has sold 32 car-loads of corn-cobs during the last year, realizing $5,600. They were sold to a pipe factory in St. Louis.....Professor Sanborn refuses to resign from the office of Dean of the Agricultural Department of the Missouri State University.....Missouri is making great advances in horticulture. It has at least 15 county horticultural societies, holding mostly monthly meetings, besides the State and various other associations meeting with more or less frequency.....At the National Conference of the Farmers' Alliance, a resolution was adopted recommending farmers not to sell their cotton-seed unless a price could be obtained equal to or greater than its value as a fertilizer; this is said to be about 20 cents per bushel..... The price of jute bagging fell from 13½, to 8½ cents as soon as the cotton-growers resolved not to use it..... The first auction sale of California cherries in Chicago took place May 13, when 53 boxes of Black Tartarians sold for 23¼ and 32½ cents per pound... ... .A California farmer started for town with a load of hay, and also took along a loaded pipe to beguile the journey. The hay and wagon went up in smoke ..... Nearly $50,000 are expended annually for dairy schools in Denmark, and the exports of butter have increased over 600 per cent. within the last 20 years.....In spite of repeated protests, the American Fat Stock Show has continued to allow butterine to be exhibited at its shows. The result of this has been that a corporation with a capital of $100,000, and W. D. Hoard, D. W. Curtis, John Boyd, S. J. Harrison, H. B. Gurler and H. D. Sherman as incorporators, has been organized as a National Dairy Fair Association..... The production and consumption of sugar in India have increased greatly in the past few years. From being an exporter, the country has changed into an importer, notwithstanding the largely increased production of the domestic article. The consumption per head of population is close on 26 pounds, against a consumption in France of 27 pounds, 19 pounds in Germany, nine pounds in Austria, 70 pounds in the United Kingdom and 60 pounds in the United States. With improved methods of sugar production, it is claimed, India not only should supply her own entire population, but should become a large exporter. Her soil, climate and other conditions, it is claimed, fit her for being the greatest sugar-producing country of the world..... A vegetable product that can scarcely be distinguished from wool, is said to have been found in Arkansas. It is called "wool-cotton," and the seed came from the Patent Office at Washington. When woven, the texture resembles wool cloth in every particular.....The 60,000-bushel elevator of the Northern Pacific Railroad at Davenport, D. T., was destroyed by fire..... The wheat harvest began in Southern Missouri the last week in May..... Several years ago, a company was formed in England for the purpose of putting up a meat-curing establishment at Sherman, Wy. T., depending upon the pure air for preserving the meat so that it could be shipped to England without refrigerators. Old settlers tried to dissuade the manager, but were scornfully told that "Americans were not up to English science." Many thousands of dollars were expended, and 2,000 sheep were slaughtered and hung up to be cured. After beginning to spoil, they were shipped and disposed of for what they would bring. The last of the machinery has just been taken away, and nothing remains but a row of posts for monuments of their folly..... At the International Fair held at Buffalo last September, two cows from the Lakeside herd at Syracuse won first and second prizes for the greatest amount of butter made in three consecutive days at that show. The judges' award was protested and the board of managers have listened to all the arguments, but have sustained the report, and paid the awards in full..... ..... The American Seed Trade Association meet at Washington, June 11. Reduced rates have been secured from railroads and hotels. This association have secured from the express companies ot the U. S. lower rates on packages of seeds and bulbs weighing less than four pounds. The new rates went into effect June 1 .... Several seedsmen have failed within the past few weeks, and the question is raised by a trade paper as to whether there are too many seedsmen, or whether the public have become tired of being humbugged.....The citizens of Stillwater, Minn., are considering the feasibility of donating 10 acres of land to James Vick & Co., for a flower garden..... A number of Nebraska farmers are experimenting in growing hemp.....The new crop teas were received in New York June 4, being 26 days from Japan.....The State Board of Health of Massachusetts last month examined 522 articles of food, of which 205 were found to be adulterated. All the lard, more than half the milk, and one-third the samples of sirup, both maple and cane, and common molasses were pronounced impure... The Eighth Annual meeting of the American South Down Association was held at Springfield, Ill. The Association is in good condition financially, and admitted several new members, among them Vice-president Levi P. Morton. The third volume of the Record is ready for distribution. The officers for the ensuing year are: J. H. Potts, Jacksonville, Ill., president; S. E. Prather, Springfield, Ill., secretary; D. W. Smith, Bates, Ill., treasurer; C. M. Clay, of Kentucky, John Jackson, of Canada and Levi P. Morton, of New York were elected directors for three years. The Association appointed a committee to consider the advisability of holding an exhibition during the coming autumn. The price of the Record to members is $2.50 per volume, to non-members, $5 00 ...The Grand Jury of Orange county, N. Y., have just indicted Alfred Gilman, the principal heir, and the administrator of the million-dollar estate of his father, W. W. Gilman, of New York, for selling oleomargarine as butter. The prosecution was instituted by the New York State Dairy Commission. The penalty for the misdemeanor is fine or imprisonment, or both, and in addition a fixed penalty of $500, recoverable by civil suit.....

Market Notes.

ONE of our correspondents in writing of the low prices received by farmers for their products, raised the question as to whether city consumers obtained their provisions at correspondingly low figures. A glance at the prices of some of the necessaries of life in this city may prove interesting in comparison with prices in other places. With the exception of rent, a family can be maintained in this city about as cheaply as anywhere in the country. Prices of all supplies vary greatly in different parts of the city. In the more aristocratic portions, rents are much higher, and customers are more exacting in their requirements, consequently shopkeepers must charge higher prices. The popular market of the lower part of the city is Washington Market, and the adjacent streets. Here may be bought any kind of fish, flesh or fowl; fruits and vegetables; butter, cheese and eggs.

A good sirloin steak may be bought here for 12 to 16 cents per pound, which will cost uptown from 20 to 30. A good rib roast will cost about the same. A stewing piece free from bone may be had for about six cents. Nice veal cutlets cost, down-town, 10 to 14 cents; while a leg of mutton may be had for about 10 to 12 cents; chops 14 to 16 cents. A whole ham is sold for about 10 to 12 cents, and boneless ham from 12 to 14 cents per pound. Corned beef costs from six to 12 cents per pound. You can buy dressed fowls for 10 to 12 cents per pound, less than they are quoted alive, at wholesale. Turkeys may be had for 10 to 12 cents. Odds and ends, such as soup-bones, calves' heads and the like, are very cheap. Fish of all kinds are in market, though shad are nearly out of season. Roe shad cost 40 to 50 cents each, while "buck" shad could be had for half that figure. Cod steaks cost a shilling per pound. Porgies are five to six cents; dressed bullheads 10 cents.

VEGETABLES have been noticed before in this column, but the prices vary so much with the season and the supply, that it is almost impossible to keep any track of them. The supply is very large, and prices are very much in the buyers' favor. The quality is generally good. Strawberries attract more attention now than any other fruit. Fine Sharpless and other varieties are selling for 10 cents per quart or "three for a quarter." They are large and nice, but the quality is not of the best. The near-by gardeners say that they are raising too much truck. This may be bad for them, but it is good for the buyers.

A WARNING TO INNOCENTS.

JAS. W. DREW.

DURING the spring vacation of the present year, the writer of this, in company with several other students of Cornell University, took a trip to New York City. It was my first visit to the city, and, of course, there were many new and interesting things to be seen. Two of us who were particularly interested in agricultural affairs separated ourselves from the others, and, besides visiting the main points of interest which all must see who visit New York, we spent some time in visiting milking stables, sales stables, veterinary colleges and other similar places. In finding these places we were materially aided by the kindness of the Editors of the RURAL, the Assistant Dairy Commissioner and one of his agents. If there are any RURAL readers who drink milk or eat beef that are produced in the stables above alluded to, they ought to know just what we saw during the forenoon that we spent in hunting up and looking through 16 of these dens of filth on Long Island; but I defer an account of these for some future time. My purpose in writing this is to tell, exactly as it happened, how I was "taken in" by a sharper, and how, if I had not read just how such scoundrels fleece innocents, I might have easily parted with what money I had with me.

My friend spent the second night of our visit with friends up town and agreed to meet me at the hotel at an early hour the following morning. At the appointed time he came, but had not yet eaten breakfast, while I had; so he went to a restaurant, agreeing to meet me again in 20 minutes. In the meantime I sauntered about the street watching the sights and studying the people who were going to their work. While thus occupied, I was asked by an honest-looking stranger if the station about a block down the street was the Bridge station? I replied that it was, and then remembering how, the day previous, my friend and I had made the mistake of climbing up on the wrong side, I walked along with him and put him right. Just after parting with him and turning to go back to the hotel, I was accosted by a man who held out his hand, and said: "Isn't this Mr. Drew from Winona?" My first impulse was either to turn on my heel or call a policeman; then, on second thought, I remembered that I had registered at the hotel as from Ithaca, and not from Winona and this must be some one who had known me in the latter place.

I told him that I did not recognize him Then he said his name was Cummings and that he was born and brought up in Winona, and that his father once ran a foundry there, naming the street. I remembered hearing of the family, and knew that there were several boys, none of whom I had known personally. I asked him how he recognized me, and he answered that he had known me by sight all his life—that he used to see me going to and from school in Winona. He then said that he had not visited Winona for five years, and began asking questions about many of the people of the place. He showed an intimate knowledge of the city and of events which had happened several years ago; but he knew almost nothing of what had occurred lately. He said he was traveling for a firm in Philadelphia and would have to start for that city in less than an hour. In the meantime he wanted me to go with him about a block to a ticket office where he had left his grip, as he wanted to show me a few samples of a new kind of cloth which was being manufactured by the firm he was representing. I told him of my engagement at the hotel, and he said that we would be back in time for me to meet it, so we walked on, talking all the time about Winona people. So busy were we that we must have walked at least five or six blocks when I suddenly remembered my engagement, and said we must have passed the place he had spoken of. He looked up at the building we were passing and said:

"Sure enough we have been so long talking that we have come a long ways out of our way." We then turned about and started back. Just then we met a villainous-looking fellow who spoke to my companion and they had a few words together which I did not hear distinctly. Then we went on. I was in a hurry to get back to the hotel, but my companion evidently was in no haste. He still plied me with questions about the people of Winona and particularly about an old schoolmate of his, whom we will call Charlie Brown.

We had gone but a short distance from the place where we had met the villainous-looking fellow referrrd to, when my companion stopped at a stand on the corner, and, asking if I smoked, bought some cigars. As I answered that I did not, he ordered a glass of lemonade for me, while he lighted a cigar. When we turned from the stand I noticed that we were not going in the same direction as before, but knowing how easily a person becomes confused in regard to the points of the compass, I said nothing but went along with my companion, still thinking and talking about the people we both had known in Winona. We soon came to the "ticket-office," and my companion, after taking a look through the partially open door, pushed it open and walked in. There was a young man there who gave Mr. Cummings his grip when he asked for it, and we sat down at a table together and began looking over the samples of cloth which the grip contained.

While we were thus engaged and while Mr. Cummings was asking me to pick out a sample piece of cloth which would, in my opinion, make a good suit of clothes for the aforesaid Charlie Brown, a man came into the room and asked the young man at the desk for a ticket to Joplin, Mo. He was a fat, good-natured-looking man of about 40, and wore a good suit of clothes, a large Western hat, a pair of blue glasses or goggles and a "hickory" shirt. The young man took him to a map which hung on the wall and showed him what roads he would pass over and told him the price of a ticket to Joplin. The Joplin man then asked him if a ticket for a "nigger" would cost the same. After some conversation about a second-class ticket for a "nigger," the young man said he would step out and find the boss who had gone out a few minutes before. While he was gone the Westerner sat down on the opposite side of the table from us, and fell into conversation with Mr. Cummings.

"Say," said he, "I don't want to act green nor to have you laugh at me; but a funny thing happened to me this mornin'and I don't see through it exactly. I went into a dime museum, and a feller in there come a little trick on me with some cards and before I got away I lost 100 toadskins."

"Toadskins!" said Mr. Cummings. "what do you mean by that term?"

"Don't you know what toadskins is?" said the Westerner, pulling out a roll of bills; "These here are toadskins;" and pulling out a gold piece, "This here is a yaller-jacket. That's what we call 'em in Missoury."

"You are very careless to carry money in that way," said Mr. Cummings. "You should buy a draft, then there would be no danger of any one stealing it from you."

"Well, maybe I had better," said the stranger. "I am a sort of greenhand in this business. I brought a lot of cattle from Missoury, and then I went over into Connecticut to visit a sister that I hadn't seen since the war, when she run off with a Yankee soldier. There was a kind of coolness between her and the old man after she ran away, but when he died a while ago he left her a lot of toadskins, and I have been over to carry 'em to her. But I was goin' to tell you how the feller got my money. He had four cards with pictures of base-ball men on one side of 'em; three was blue and one was red He handled them cards most awful slick and I thought I could see where the red was: but when I bet I lost 'most every time; but I grabbed the cards when I came away and I've got 'em here."

Hereupon he pulled out a bandanna handkerchief and unwrapped the four cards he had been speaking of.

"Now," said he, addressing Mr. Cummings, "I can't handle these cards as slick as that feller did; but I'll bet you can't tell which the red one is," and he laid them down one at a time on the table, purposely allowing us, as he did so, to see which was the red one. Mr. Cummings bet the cigars with him, and of course won. Just at this juncture the fact that I was in a den of thieves flashed across my mind, and I arose from the table and started for the door. I more than half expected to find it locked, and was never before in a place where I really thought I needed a revolver, but I was happily disappointed, and as I stood in the doorway I told Mr. Cummings (?) who was of course trying to get me to come back, that if he wanted anything more of me he could come around to the hotel at noon and I wouldn't be there.

Right at this point I made a great mistake. I should have made a note of the street and number; but I was so glad to get out into free air again, and so afraid that my friend would tire of waiting for me and be gone, that I thought only of reaching the hotel as soon as possible.

As I walked along, I tried to study out how this man who called himself Cummings and who had such an intimate knowledge of Winona and its people, had found out that I came from it. It was not till after I had retired that night that I remembered that during my walk early that morning with the man who wanted to find the Bridge station, I learned that he was from a place near Winona, and had told him that I was from Winona and had always attended school there.

Of course, this Cummings (?) had followed me from the hotel where he had learned my name from the register and had been very fortunate in hearing me tell the stranger that I was from Winona. That he had once lived in Winona I have not the slightest doubt, for he knew all about the early history of the city and its people; but whether his name was Cummings or Smith is a matter of question. He certainly is a confidence man who ought to be handed over to the police, and it is a matter of regret to me that I could not have helped to do it.

R. N.-Y. This is a favorite game of confidence men and one that in a majority of cases succeeds. The first man that you talked with was undoubtedly a friend of "Cummings." It was a simple matter for the two rogues to communicate with each other before "Cummings" introduced himself to you.

THE BUYERS' UNION, a swindling concern, one branch of which was broken up in this city the other day, still has flourishing branches in Philadelphia, Cincinnati and Chicago, and perhaps elsewhere also. There is no doubt that several other concerns of the same character are swindling the public to a very profitable extent in various parts of the country, and a caution against one should serve as a warning against all. The "Union" proposed to give subscribers the privilege, for 10 years, of buying books at wholesale prices. It pretended to have $50,000 paid-up capital besides property in New York, Chicago and Philadelphia, consisting of an opera house and five stores, besides a farm in Michigan. All these claims turn out to have been false. A fellow called Ernest G. Loomis, the "promoter" of the scheme, is said to have obtained $1,000 each from 80 to 100 subscribers who were anxious to represent the Union in their respective States, and the officers in this city invested from $1,000 to $5,000 each in the business, all of which found its way into the pockets of Loomis. In addition to these large gains, the concern secured a number of small ones from ordinary subscribers who were desirous of obtaining the cheap rates on books promised by the Union. As in other concerns of the kind, each subscriber sent in from $5 to $10 as a kind of initiation fee, entitling him to the benefits of the organization.

In all such schemes, at the outset, the books ordered are sent apparently as per agreement; but in reality the concern makes a clear profit on every order. So long as subscriptions come steadily in, an appearance of doing a square business is industriouly kept up; but when "business" becomes dull or that particular section has been worked "for all it is worth," the schemers usually pocket all the money that comes to them, failing to send any goods in return, and after a short time, the concern collapses. Sometimes the manager or general-factotum disappears with the "boodle;" but frequently he remains and poses as an unfortunate philanthropist whose ambition to benefit the "dear" but inappreciative public has led him to ruin his own fortune. In such cases, however, the fellow soon manages to start again in the same or some other business with much larger resources. Where did they come from? Pshaw! Can't you guess?

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:

"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:

"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:

"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:

"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:

"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:

"The RURAL NEW-YORKER is the best agricultural paper in the country."

From Josepn Harris, Moreton Farm, N. Y.:

"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined.

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

The Rural New-Yorker,

CATALOGUES, ETC., RECEIVED.

PHOSPHATE MEAL.—Some few weeks ago the R. N.-Y. called attention to some remarks made by Ex-Mayor Hewitt of this city regarding the basic process of making steel. The introduction of this process into this country will have a great influence upon the agriculture of the South and East because it will cause the production, in vast quantities, of a new phosphatic fertilizer. This Thomas basic slag or Thomas scoria, is already being sent here from Germany. The South Carolina Experiment Station conceived the idea of testing it by the side of "floats" or finely ground S C. rock phosphate. In Bulletin No. 5 we find an account of an experiment with these two fertilizers on oats. The importer who furnished the new fertilizer thus speaks of it:

"It is obtained from the so-called Peine-Thomas scoria through the dephosphorization of pig-iron, after the patented method of Sidney Gilchrist Thomas. The dephosphorization of the iron takes place by melting the iron with lime in a current of air, a proceeding by which pig-iron, rich in phosphorus, is converted into steel, free from phosphorus (ingot iron). In this manner the phosphorus of the pig-iron is converted into phosphoric acid, which, uniting with the lime added, forms phosphate of lime. The melted mixture of phosphate of lime, with the excess of lime and combinations of the iron and manganese, obtained by this proceeding, is called Thomas scoria. It is brought into the market for the purposes of agriculture, in a finely ground state."

Analyses of this substance made at the station showed 21.46 and 26.60 per cent. of phosphoric acid. It was tried side by side with "floats" and showed a slight but steady superiority. This substance is destined to greatly influence American agriculture.

JACKSONVILLE AUXILIARY SANITARY ASSOCIATION.—This Association has issued a report of about 300 pages, giving a history of the terrible epidemic of 1888. The report is in the form of a diary giving an accurate description of the growth and gradual decline of the plague. Following this are reports of financial, sanitary and other committees. It is to be supposed that Jacksonville was cleaner than ordinary Southern towns, yet when the fever broke out the town was full of bad smells and dirty places that served admirably as plague breeders. The committee met with a severe obstacle in their work in opposition from those who objected to having dirty places cleaned up. Crowds of idle men congregated in the streets breeding disorder and trouble. It was found necessary to provide work for these men, and a good proportion of the funds sent from other localities were spent in paying these idlers for work at cleaning the city and digging drains and ditches. In every case of local calamity it is found necessary to provide work for the unemployed who are thrown out of work the moment the general business of the place is interfered with. The recent terrible calamity at Johnstown shows this. There, thousands of men who depend for a living on their wages from day to day were thrown suddenly out of work. They stand in need of wages rather than of charity, and the money so generously contributed by others will be paid to them in return for their services in clearing away the wreck. This wise plan was followed at Jacksonville with excellent results. This pamphlet ought to be sent to every town in the Gulf States, and the public officials of such towns should be compelled to read it through. All through that dismal fever siege there ran a streak of humor. The following telegram was sent to a Jacksonville merchant by a brother at the North:

"Dear John:—Keep cool. Don't worry. Trust in Providence. Keep taking pills and you will pull through all right."

REPORT OF THE COMMISSIONERS OF THE STATE RESERVATION AT NIAGARA.—This is the fifth report of this commission. It details the work done during 1888, contains some interesting facts about the Falls of Niagara, and also five beautiful photo-engravings of views taken from both American and Canadian shores.

INSECTS INJURIOUS TO FRUITS.—This is a new edition of the celebrated work by William Saunders, reduced in price and with information carried down to the latest facts. This has long been known as a standard publication and farmers and others who wish a cheap and comprehensive treatise on entomology will be thankful for this new edition. It is published by J. B. Lippincott & Co., Philadelphia, price $2.00

INSECT LIFE.—No. 11 of this publication is sent from the Department of Agriculture. This magazine is mainly devoted to technical information for advanced students of entomology, but there are in each number bits of practical information that any one who knows what an insect is can understand. Here are a few found in No. 11: A correspondent states that a toad placed in a room will clear it of cockroaches. Notwithstanding the frequent reports of serious injury from bites of spiders, it is not thought likely that any American species can cause much injury. Varieties of spiders are found in New Zealand and in Russia that inflict dangerous wounds. Professor Peyritsch, of Berlin, is convinced that double flowers are frequently produced by the agency of mites which work upon the plant organs in their earliest stages. Dr. Tere says he has applied the bee-sting remedy to 173 cases of rheumatism with uniform success. Australian authorities are to offer at all the agricultural fairs cash prizes for the largest number of heads or eggs of the English sparrow. In Tasmania, the farmers who neglect to fight the coddling moth with prescribed methods are prosecuted.

HORSES.—This is the title of the latest pamphlet issued by Smiths, Powell & Lamb, of Syracuse, N. Y. Lakeside stock farm has been for years noted as the home of the largest herd of pure-bred Holstein-Friesian cattle in the world. Of late years preparations have been made to include the breeding of fine horses in the various industries clustered at "Lakeside." As a consequence the visitor may now find splendid specimens of Clydesdale, Percherons, French Coaches, American-bred Coaches and Standard-bred trotters. These will be sold for breeding purposes or for driving purposes—either matched or single. It is hardly necessary for us to inform our readers that the horses they purchase at "Lakeside" will be well-bred, serviceable specimens of their breed. Smiths, Powell & Lamb do the sort of business that will not allow misrepresentation.

CORN-FED PORK FOR KANSAS.—Professor E. M. Shelton, of the Kansas Experiment Station, issues a report of some experiments recently made in pig feeding. As our readers well know, Professors Henry and Sanborn have conducted "fat or lean" experiments which go to show that a farmer can, by feeding certain foods rich in nitrogenous substances, produce pork with a larger percentage of lean meat than that contained in pork as ordinarily sold. In these experiments young animals were fed. More recently Professor Roberts has conducted similar experiments with sheep and mature hogs, the result in each case indicating that "feeding for lean" is a possibility, though the *profit* of such feeding has hardly yet been demonstrated. Now Professor Shelton comes along with a set of figures and facts that tend to mix things up sadly.

Since the publication of the results of the experiments in Wisconsin, Missouri and New York, a renewed outcry against "corn-fed pork" has been raised. By feeding milk, peas, cotton-seed meal and other like foods hogs with an extra proportion of lean meat, were produced. The class of people who do the most talking want lean meat and a good many of them are willing to pay extra for it. In the West, where, by the way, the great proportion of American pork is produced, corn is the great hog food. As Professor Shelton says in this report:

"To the farmer of Kansas there is but one common, easily accessible carbonaceous food, Indian corn, while his choice of nitrogenous foods is necessarily limited to two, bran and shorts. It is futile to talk to Kansas farmers of peas or even milk as general pig feed; the one is not generally grown and will not be, and the other could not be had in quantities sufficient to even moisten the corn fed to our swine."

As matters stood there was an evident movement on the part of consumers here, towards a still further discrimination between Eastern and Western-raised pork, because it seemed to be understood that Eastern farmers were feeding a greater variety of foods with a view to increasing the proportion of lean meat. So Professor Shelton conducted his experiment with a hope of seeing if Kansas farmers can afford to use shorts and bran in the place of some of their corn. We should judge that Professor S. is not at all sorry that the figures of his careful experiment indicate that corn is still the most profitable food for the Kansas pig-feeder.

The full details of the experiment are given in the pamphlet under review. They are too lengthy to be given here and they cannot well be condensed. We advise pig-feeders to secure the pamphlet and study it. We call attention to the following summary with which Professor S. concludes his report:

"The truth is, the great American staple, Indian corn, is an incomparable grain food when used simply for fattening, or when judiciously blended with other foods in the process of growth and development of the animal. But it is when we consider the cheapness and ease with which Indian corn is produced, due to its perfect suitableness to American soil and climate, that its superiority to all other forms of grain food becomes strikingly apparent. Thus a single acre yielding the quite ordinary product of 50 bushels of corn, would according to the facts of this experiment, produce 513 pounds of pork. Moreover, in the case of the chief portion of the agricultural sections of the American continent, there is no other grain that is really available for meat-making. It is futile to talk of using bran, shorts, barley, oats, milk or peas, in pork-making, upon a large scale. The instant that we are reduced to the necessity of using any or all of these foods as a substitute for Indian corn, our supremacy as a pork-producing nation will have passed to others.

The objection often urged against the general fatness of corn-fed pork seems to me to have no sufficient foundation in the wants of consumers. It is true that towns-people generally demand lean fresh meat, but work people, who are the chief consumers of pork the world over, demand fat meat, and of the salted article will take no other: while with all classes pure lard is a staple article, for which they cheerfully pay a price such that the fat portions of the hog before "rendering" are more profitable to the butcher than the lean parts of the carcass.

The results of our feeding fully-matured pigs in equal sets upon shorts, bran and corn meal during a limited forcing or fattening period may be briefly summed up as follows:

1. The shorts-bran-fed pigs required for full ripening nearly or quite 25 per cent. more of time than was needed by the corn-fed series; but even when the feeding of the corn-fed lot was prolonged—to their great disadvantage—to a period equal to that occupied by the shorts bran-fed series it cost to make a hundredweight of gain from shorts-bran 25 cents more than was needed to make a like gain with corn meal alone.

2. The corn diet, as compared with shorts-bran, had no unfavorable influence upon the vital organs, so-called, with the exception of the kidneys. The testimony upon this latter point, however, is not conclusive.

3 The corn-fed pigs had stronger bones than those fed shorts-bran, and the quality of the bone tissue was distinctly tougher and more fibrous.

4 The meat of the pigs fed corn was fatter than that made from shorts and bran, a fact fully explained by their excess of gain, (98 pounds) but the advantage of either series in respect to the amount of lean meat, or in its distribution with the fat (marbling) was not distinguishable by the senses.

5. The quality of the meat, as a whole, of the corn-fed pigs was clearly better than that of the shorts-bran series, for cooking by boiling; the results obtained from roasting lean meat gave occasion for a difference of opinion as to superiority in the quality of the meat of the two sets, while frying failed to show any advantage for either."

MAGAZINE REVIEW.

PROBABLY no private American citizen fills so large a place in the popular heart as George W. Childs of the Philadelphia Public Ledger. A self-made man who has risen to affluence by his own exertions; his munificent benefactions; his princely hospitality at Wootton have made his name a household word throughout the land. It is peculiarly gratifying to know that the publishers of Lippincott's Magazine have succeeded in inducing Mr. Childs to contribute four articles of "Recollections" to that periodical, the first of which is given in the June number, and which deals more particularly with his early life. The secret of his success is contained in this description of himself when but a boy:

"When first at work in Philadelphia I would get up very early in the morning, go down to the store, and wash the pavement and put things in order before breakfast, and in the winter-time would make the fire and sweep out the store. In the same spirit, when books were bought at night at auction, I would early the next morning go for them with a wheelbarrow. And I have never outgrown this wholesome habit of doing things directly and in order. I would to-day as soon carry a bundle up Chestnut street from the Ledger office as I would then. As a matter of fact, I carry bundles very often. But I understand that certain young men of the period would scorn to do as much." What an example for the young! Gen. Lloyd Bryce presents "A Dream of Conquest," a very ironical novel, complete in this number. In it he portrays the weakness of our navy and coast defenses, and represents China attacking us with her powerful navy. Judge Albion W. Tourgee contributes another installment of "With Gauge and Swallow." R. H. Stoddard gives some interesting reminiscences of Fitz-Greene Halleck. An article of special interest to women is "Social Life Under the Directory" by Anne H. Wharton, which describes the customs and costumes of that time. Madeline Vinton Dahlgren and Miss J. K. Wetherill contribute respectively "Who was She" and "A Silent Minority." There are several poems, "Monthly Gossip," "Book Talk," and other departments that go to make up an interesting number.

EVERY person sending in one yearly subscriber will get the paper free for one year. Every subscriber paying 25 cents for a year's subscription has a chance to guess on the number of letter O's which will appear on the 8th page of the subsequent issue. The correct guesser or the one guessing nearest the right number will receive an elegant gold watch. The next best guesser gets a silverine watch. A getter up of a club of two will receive a package of eight bottles of elegant perfume. 30 cents gets a copy of the paper for a year and ten books. Fine Fishing Tackle with every two subscribers. Ideal Hair Curler free with every club of three. Gold Watches, Buckeye Mowers, Music Boxes, etc., given away. Send 25 cents for a year's subscription and get chance to guess, or 2 cents in stamps for sample copy and premium list. Address

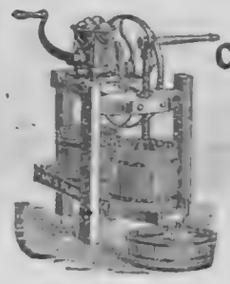
ISLAND HOME STOCK FARM.

Savage & Farnum, Importers and Breeders of Percheron and French Coach Horses, Island Home Stock Farm, Grosse Isle, Wayne County, Mich. We offer a very large stud of horses to select from, we guarantee our stock, make prices reasonable, and sell on easy terms. Visitors always welcome. Large catalogue free. Address
Savage & Farnum,
DETROIT, MICH.
Percheron Horses.
French Coach Horses.

HORSES
FOR ALL PURPOSES AT LAKESIDE.
Standard Bred Trotters.
A rare lot of Young Stallions of most popular lines of breeding.
French Coach Horses.
Imported and American Bred, of very superior quality, style and action.
Clydesdales.
A Superb Lot of Young Stallions, Mares and Fillies of this valuable draft breed, the result of years of intelligent and careful importing and breeding.
Percherons.
A few unusually fine young Stallions of this deservedly popular breed.
Catalogue containing full descriptions and pedigrees mailed to parties interested. In writing mention this paper.
SMITHS, POWELL & LAMB,
SYRACUSE, N. Y.



NATIONAL CIDER & WINE MILLS.
Best qualities of both Crushing and Grating Mills combined.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

PHOTO ENG. CO. N.Y.

VOL XLVIII. NO. 2056 NEW YORK, JUNE 22, 1889. PRICE FIVE CENTS, $2.00 PER YEAR.

[Entered according to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

Sheep Husbandry.

A GROUP OF SHROPSHIRE EWES.

THE sheep shown at Fig. 156 were awarded first prize at a recent English show. They are regarded as excellent specimens of the breed. Years ago, the South Down was about the only breed of sheep that was mentioned in connection with English mutton. It may be said now that the Shropshires have fairly divided the honors with the South Downs as mutton sheep. In this country, the great value of the Shropshire lies in its peculiar adaptability for the work of improving the mutton quality of our common sheep A cross of the Shropshire on common ewes gives an excellent lamb that is sure to sell at an advanced price. It is probable that among those who are in the business of supplying this market with early lambs, the Shropshire is a decided favorite.

Farm Topics.

USE YOUR BRAINS.

Crops are easily raised, but brains are needed to raise them profitably; they are needed in determining the most profitable crops and in raising them at the lowest cost and in utilizing labor; extra profits from the use of brains in a decade.

THERE can be no possible doubt about the fact that we have brains on the farm, but do we use them? Judging by results on a great many farms, we do not. We seem to think that raising corn, wheat, pork or butter is farming. But it is not. Any laborer can raise a crop of corn; but it takes a farmer to run the farm The question for the farmer to decide is what crops can he most profitably raise, taking into consideration all the factors essential to the profitable raising of such crops, such as the quality and quantity of labor at his command, the nearness of markets, the condition of his soil, etc. Then he must decide how he can get the largest yield with the least cost. The right kinds of crops being determined upon they should not conflict with each other, but should "dovetail" in as regards labor and other considerations. Last year a farmer in this neighborhood who had sold his early potatoes—which were small—for 80 cents per bushel, and could not get 50 cents for his late potatoes—which were large—remarked that he did not think he would raise any more early potatoes: not because they did not pay, but because they interfered with his system of farming by taking labor from other crops when it could not well be spared, and the difference in price between the early and late potatoes did not warrant him to change his plan of farming.

The labor question enters most largely into the matter of profit, and is a question that should be taken into most careful consideration.

Is it good? Is it cheap? Then raise crops that require much labor and thus make a profit on labor as well as on the crops. Is it scarce or high? Then raise crops that require but little labor, and buy every labor-saving implement that you have the money to pay for, and if you, yourself, instead of the hired man, will use and take care of the tools, each one will pay for itself before it is worn out. A gentleman has declared in one of our Western papers, that among other things the self-binder must go. He has a large dairy farm and probably he may dispense with the binder and be better off without it, as he necessarily keeps considerable help and can afford to take the time to harvest his grain unbound. But if he had been around these parts during harvest and seen some of our farmers paying two or three extra hands $1½ a day, while others with no extra help, were doing the same work by means of their self-binders, I think it probable that he would have said that the self-binder must "go" from early in the morning till late at night.

Having decided what crops to raise—and this can be determined only by personal experience on one's own farm, observation of one's neighbor's, and the help of agricultural papers,—there is another urgent call for brains in raising the crops with the most profit.

Let us, for example, see how the use of brains works in the wheat crop. What kind of fertilizer produces the largest yield with the least outlay? You don't know. Have you tried the different sorts side by side, noted the results, and calculated which was the most profitable? Probably not. What quantity of seed per acre produces the best results? You don't know. Have you tried the various quantities side by side and noted the results? Probably not. Do you make every effort to have your ground plowed, cultivated and sown at the right time, or do you work when it is most convenient? I am afraid most of us have given our brains too much of a rest on the above questions. Let us see how proper attention to these matters pans out in dollars and cents.

We will suppose the difference in yield caused by varieties of fertilizers (the outlay for fertilizers to be the same, but the same priced fertilizers not necessarily to be used) quantity of seed, and time of plowing, cultivating and sowing, to be two bushels per acre, calculating the price to be $1 per bushel and the average area of the crop to be 10 acres: then in 10 years the result in favor of brains is $200. This is only one crop. When we think of the other crops and all the little odds and ends on the farm that need brains just as much as this crop, we can hardly help saying that what the farmer needs is to use his brains first, last, and all the time. S. O. L.

GROUP OF SHROPSHIRE EWES. Fig. 156. Re-engraved from the London Live Stock Journal.

The Poultry Yard.

POULTRY NOTES.

GAPES IN CHICKENS.—This is the time of year when, in many poultry yards, young chickens by the dozen may be seen gradually but surely choking to death with the most fatal disease to which young chicks are subject. The cause of this disease is numerous small white worms which fill the windpipe causing strangulation. The origin of these worms is a subject of much dispute. This is immaterial. The remedy is what we want. The chicks will be less liable to attack if kept on fresh ground where poultry have not been kept before, but this is not always practicable. Many "infallible" remedies are published every year, but still the chickens go on turning up their toes prematurely.

The barbarous practice of fishing out the worms—or attempting to—with a horse hair or feather, with most operators will kill more than it will cure. Many of the other remedies recommended are nearly as bad when given ignorantly or carelessly. There is hardly a farmer but has a remedy within his reach if he will faithfully use it. Onion tops and onions chopped fine, mixed with the soft feed and fed twice daily, will prevent the gapes, will cure them if not too far advanced, and will greatly relieve the chick in all cases where it has strength enough left to eat. They must be fed faithfully, twice a day; once will not do. I have used this remedy for several years, and have never lost a chicken from this cause when it was given faithfully. Do not give the chicks sloppy feed; give plenty of pure water and shade, and they will repay the extra trouble. Bone meal and meat should also be fed, especially if the chicks are confined in yards.

Kill, sell, or give away the roosters after you are through setting eggs for the season. You don't want to breed from them again; the hens will lay bet-

ter without them; the eggs will keep better if you want to pack them; and you will save considerable feed. The roosters must go.

Look out for the lice. They breed with incredible rapidity during the summer months, especially if the houses are not thoroughly cleaned. Provide the hens with a good dust-bath if they are confined in yards. Eggs are higher now than at any time since mid-winter.

It is very poor economy to throw soft feed into the dirt. Place boards in front of the coops to feed the chicks on. Place troughs in the hen-house in such position that the hens cannot get their feet in them.

Provide plenty of pure water for the hens. An egg is more than three-fourths water. Some men say a hen doesn't need water. No farm animal will suffer more for want of it. Such men should be set on a desert island for a short time with "never a drop to drink." F. H. V.

Farm Economy.

TRUCK WAGONS ON FARMS.

THE Cornell University and the Mississippi Land and Cattle Company of Calhoun, Miss., use trucks briefly described as follows:—see Fig. 152. Wheels 30 inches, 2 1-2 inch tires,—they would be better if they were three inches—distance between axle-trees when used with dump board box 7 feet 2 inches; when used with hay rack the reach is lengthened. Width of bolster between stakes four feet; tread five feet from center to center of wheels. Top of bolster 24 inches from the ground. Weight of wagon without box 600 pounds. For carrying crates of potatoes, etc., stone, manure and the like, dump boards are used made of clear basswood 2 1-2 by 4 inches, and side-boards and end boards of the same wood 1 1-2 by 8 inches and of the length desired. The hay and grain rack would also best be made of basswood. Sills 2 by 8, 16 feet long; 4 cross-pieces 2 by 5 inches, 7 1-2 feet long notched half an inch on the sills; 4 cross-pieces 1 1-2 by 4 inches 4 feet long; 6 slats 1 1-4 by 4 inches 16 feet long; 2 pieces 2 by 4 16 feet reduced on one edge to 3-4 inch. These are nailed on the top of the outside slats to give them strength and to prevent the load from sliding. See Fig. 154. A board 8 inches wide and 7 1-2 feet long should be placed crosswise over the top of the truck at the extreme rear end: 6 carriage bolts, 1-2 inch, 14 inches long, 24 carriage bolts, 3-8 inch, 6 inches long, 1-2 pound 10-penny nails.

The trucks will turn in a much shorter space, if the sills to the rack are brought together from four to six inches in front, and blocks are nailed to the side of the sills to fill out to the stakes of the front bolster.

If the dump or farm box described above is made 12 feet long, it may be left on and the rack described above, *minus* the sills, can be used; the side boards of the dump box serving in place of sills. This cheaper rack 14 feet long will easily carry one ton. The more elaborate one will carry two tons. The only danger is that the load will exceed the strength of the team. It will be noticed that the top of the rack on the truck is but three feet one inch from the ground, or just the hight of an ordinary man's trousers' pocket; while the flat rack--see Figure 153--on an ordinary wagon is four feet nine inches high. Fully one-half of a ton, possibly three-fourths of a ton of hay may be put on the truck before the load reaches the hight of the rack of the ordinary wagon. If we take the V-rack, the difference is still greater. In this the first part of the load as well as the last has to be pitched four to five feet higher than with the lower wagon. While the truck can hardly be tipped over, the latter contrivance keeps one nervous for fear the center of gravity will not remain over the base.

The trucks we are now using were manufactured by the Groton Manufacturing Co., Groton, N. Y., when they were building mounted horse powers. Knowing the great value of farm trucks by practical experience—especially since we have gone so largely into silage farming—I notified the manufacturers over a year since of the great demand for a cheap perfected truck that would inevitably follow the silage and potato boom. The cost of such a wagon without box, should range between $20 and $30

The hubs are cast, there are no front hounds or ironed stakes, and all the parts are very simple and plain. How a farmer can afford in these days of low prices to pitch hay, manure and grain, lift stones, potatoes and wood, two or three feet into the air unnecessarily only for the fun of throwing them down again cannot be scientifically explained. I. P. ROBERTS.

Cornell University, Ithaca, N. Y.

Everywhere.

THE CASH CROPS.

WHERE THE MONEY COMES FROM.

WESTERN REPORTS.

IN the RURAL of May 25 we gave some interesting answers to a series of questions designed to show what farmers depend upon for their cash. Here are some more answers from Western readers:

1. What do you sell to raise cash?
2. Where are they sold?
3. How about the past and future of prices?
4. Are any farmers obtaining extra prices?
5. What changes have occurred in the past 10 years?

FROM KANSAS.

1. Corn, flax, cattle and hogs.
2. The overplus is mostly sold at Kansas City.
3. Good till this last crop. The next crop will be good.
4. I think not a great many.
5. When I came here, 10 years ago, this section was mostly prairie; now it is all settled up with railroads, and small towns all around us. Since the emigration to the western part of this State and the rush to the South this spring many farms have not changed hands, consequently land is low-priced.

Lone Elm. J. W. H.

1. Flax seed.
2. It is sold at home, being generally bought by the grain dealers. We also sell hogs and cattle.
3. Prices are about the same as usual, except those of cattle which are 40 per cent. lower. There are no prospects of better figures.
4. No.
5. Farmers have not changed much in the last 10 years. Before the dressed beef syndicate went into operation, farmers in this region were doing well. I think that if farmers would go into dairying more they would make more money. D. B.

Centralia.

1. Vegetables, fruits, cows and hogs.
2. Fruits and vegetables are sold at Strong City, and hogs to shippers.
3. Very low with but little show for the better.
4. None that I know of.
5. Not very much. This is not a farming country to any extent. It is a stock country The mode of stock raising has changed a great deal in 10 years. People now-a-days keep less stock but they are of better quality and they feed better. J. H. C.

Strong City.

1. Corn, pork, sheep and wheat; and, to a less extent, oats, millet seed, flax-seed, fruit, poultry, eggs and butter.
2. They are mostly sold here at our stations to local buyers who ship to Kansas City, St. Louis and Chicago.
3. Prices of fat hogs for the last few years have been good, averaging about four cents per pound. Good average fat cattle have brought about five cents per pound, but prices are low now—only 3½ cents per pound. Corn has averaged 25 cents per bushel; but it is only 20 cents now. Future prospects for hogs are very good; for fat steers and cattle very dark. Good corn-fed beef at 3½ cents per pound means dissatisfaction among the feeders. The prospect for the future of course depends on the season, which has been very good here so far.
4. Only those who have the best and smoothest hogs and steers.
5. The only change is an increase in corn and its products—pork, beef, poultry, eggs and butter. Now 100 bushels are raised, where one bushel grew 10 years ago. This was a new country then. R. R.

Sabetha.

1. Hogs, cattle, wheat and corn; with a small amount of butter and eggs. These are the *only* products of this section.
2. Hogs, to local shippers; cattle, to certain farmers who fatten and then ship them to Kansas City; wheat to local millers; and corn to stock-feeders and shippers, and butter, eggs, etc., to local merchants.
3. Up to last year, or until the railroads came here, we obtained splendid prices and there was a good demand for everything; but since then the farmer's greatest source of income being cut off—*i. e.* freighting and hauling lumber and goods—we have had no market for anything save hogs and steers and they bring much lower prices than those that are obtainable in the Mississippi valley, because we are so far from market. The future seems as though it will be hard to make current expenses.
4. Yes, by getting their products in the best possible shape when they sell.
5. The farming has changed only in the method of putting in and tending the crops. Our farmers are experimenting now with castor-beans and broom-corn, and the former seems likely to pay well; but if such should be the case three or four of the adjoining counties can and will flood the market to over-flowing in a short time. I raised about 600 bushels of peanuts last year and 1,200 gallons of cucumber pickles and neither will pay freight to market. Then, my broom-corn neighbor has his stock of nice green dwarf corn and would be glad to realize two cents per pound for it. Almost all of us brought money with us here, and we got along finely till the railroad monopoly came, and said, "We will haul for one dollar the same load for which the farmer charges five." The consequences are that the one dollar goes East and never returns (except in the one way of a loan on land); whereas the farmer's $5 kept on changing from farmer to merchant and *vice versa*. Burst up the trusts so that the laborer will be able to buy his other commodities as cheaply as he buys farm products; then we can pay a hand $10 per month the year around, and both will make money; but as long as the hired man demands $20 per month for six months and lies idle the other six and boards himself, we are both losing money.

From a careful study, it seems that a man who is close to a large city or even to a mining district where men work only half time, is doing fairly well, whereas the man who lives remote from these places is having a hard row to hoe. J. J. M.

Iuka.

1. At the present time corn, hay and cattle.
2. They are sold mostly to local shippers. Shippers sometimes gather up in August and September what we call stockers, and these they will hold for the spring market, often buying corn and hay to fatten them. A drove of stock hogs always follow cattle during the feeding, and when the former are ready, the latter are also fit for the market.
3. Cattle and corn paid well until the last year; since then prices have been too low. The hog alone seems to be the poor man's friend one year with another.
4. There always are a few who are more skillful than their neighbors at large in their management. For instance, some put 250 to 300 pounds of flesh on their hogs when nine months old; while others feed 18 months to make the same weight. The secret of hog feeding consists in giving a variety—milk at first, then oats, then soaked corn. Continue to change from one to the other. Keep up the milk feed if possible until the pigs are six months old. I always feed twice a day and never over-feed. The extra profits are made by saving feed.
5. Wheat 10 years ago was the staple crop. Corn came next, and then oats. Latterly wheat has dropped partially in the shade, oats and German millet filling the vacancy. Last year German millet fell from $1 50 to 20 cents per bushel, hence millet has gone out of sight for a while and the vacancy is filled by oats and corn. Both of the latter are looking well to-day. This is a big country. A man sometimes leads the masses in some staple crop, and when all are ready to take hold of the same thing, if he is wise, he drops out, and takes something else. That is the man who makes the money. The farmer has got to the place where the merchant stood 30 years ago. Competition is forcing many to mortgage, who never pay off that mortgage. The only way I can see for farmers to get along is to raise a variety of products. We can save a little from each, and all the little savings put together, will give the thoughtful farmer something for old age. G. L. W.

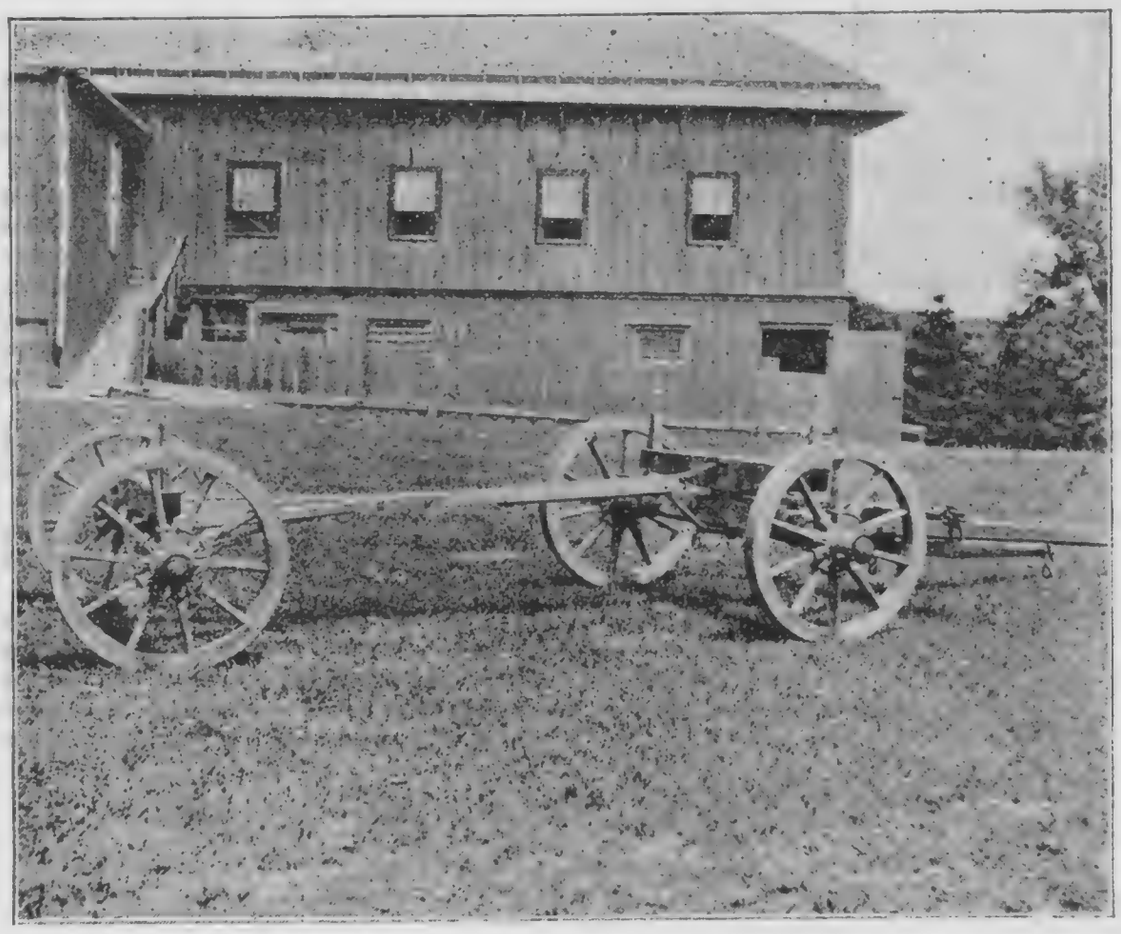
Clay County.

1. Wheat, hogs and cattle.
2 and 3. Wheat is sold to the millers in Leavenworth. Stock is sold to packers and shippers in Kansas City. Wheat has averaged 60 to 85 cents, except during a short time last fall when the price reached $1.00 to $1 05, but we didn't sell then. Some farmers who then refused $1 per bushel have sold during the past week at 78 cents. Prices of cattle ruled extremely low until quite recently. Good cows are selling at $1.75 to $2.00 per 100 pounds on foot. Hogs bring $4 to $5 per 100 pounds live weight. Considerable hay is left over for which there is practically no market. Potatoes are 25 to 30 cents per bushel.
4. Not so far as I know.
5. None to any great extent, although some are engaging in the dairy business, selling milk—present price 8½ cents per gallon net, shipped to Kansas City. Some prefer making butter as that leaves the skim-milk, etc., on the farm to be fed to pigs and calves, but the competition with Kansas City hog and bull butter, is so strong that there is little profit. Prices at present are 16 to 18 cents per pound. Prices for farm products are continually tending downward. This is a splendid country, with numerous natural advantages—good land, pure water and cheap fuel—yet this (Leavenworth) is the most debt-ridden, tax accursed county in the State. My quarter section is assessed at $2,390: tax last year, $89.00. J. M.

Bastian.

FROM WISCONSIN.

1. Mixed farming is practiced here. A majority of our farmers raise garden vegetables, from five to 20 acres of potatoes, and about the same number of acres of sweet corn. From 1,000 to 10,000 tomato plants are also set out by each of the farmer gardeners, and they raise other garden produce in proportion.
2. This place, Caldwell, is 23 miles from Milwaukee, and we draw our produce to the city with our teams, selling to grocery-men, hotels, boarding-houses, and at times we deposit our goods with commission-men.
3. Prices are very low and the prospects don't indicate any great advance.



TRUCK WAGON USED AT CORNELL UNIVERSITY. Fig. 152.

4. No.

5. A great many. In this section two years ago, the farmers' whole attention was given to the growing of wool and the breeding of sheep for the Western market. Within the last two or three years they have gone into dairying, carrying their milk to co-operative factories. This is greatly owing to the great advertising the farmers' institutes have been doing in favor of the dairy interests; the business has been over-done. There is an over-production here or an under-consumption elsewhere.

It would be greatly beneficial to the farming interests if Congress would so legislate as to prevent foreigners or foreign syndicates from occuping any of our public domain for raising stock or any other purposes. Every foreigner should be a resident of the United States five years before he is allowed the full

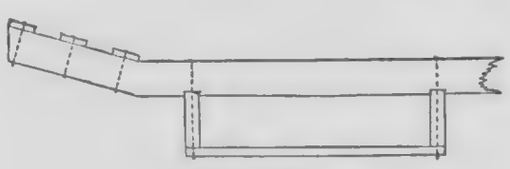


Fig. 153.

privileges of American citizenship. Congress should so legislate that no American or syndicate of Americans should be allowed to occupy our public domain for the purpose of raising stock or farming in any shape or form, working against the actual farmer who is making the improvements and paying the taxes to support the government.

These are questions of great interest. When we examine our records we find that our real estate was never so heavily mortgaged, according to its assessed value, as at the present time, and why is it that land in York State that sold for $75 to $100 per acre 10 and 15 years ago, is now on the market for $50?

Caldwell. L. C. W.

1. Nearly all depend upon cheese and pork.

2. They are sold mostly to local buyers.

3. Prices averaged very well until last year. Low prices seem probable for farm produce this year.

4. No; for people don't take pains to raise anything of extra quality.

5. Grain used to be the principal crop raised 10 years ago; everybody raises now cows and hogs with only grain enough to feed. The change has been caused by poor grain crops; due to chinch bugs and drought, and by the good prices for cheese, when the business was new. I would suggest as a mode of increasing profits that people should take better care of their cows; weed out the poor ones and grade up. It costs no more to keep a cow that gives 35 or 40 pounds of milk per day than one that gives 20 pounds. One man here gets 100 pounds per day from three cows. Others with six to 10 cows get less than 200 pounds. The best dairy cows don't average 30 pounds apiece at any time. We have seven cheese factories in our town. I think the farmers ought to work together and sell to the consumers and get the middlemen's profits themselves. J. B. L.

Greenbush.

1. Stock, dairy products, and potatoes.

2. To local dealers for the Chicago market.

3. Beef cattle have been very low for several years—two to three cents per pound live weight. Prices for dairy products are very good; butter 12 to 20 cents; cheese seven to nine cents. Potatoes are the largest crop in this section; except during the past year, they averaged 45 to 60 cents per bushel. During the past season they have brought only eight to 20 cents per bushel, and thousands of bushels have been fed out to stock. Future prospects are fair.

4. Yes. By producing first-class articles for market.

5. Formerly wheat and other grains were extensively grown; now not enough of these is grown for home consumption. Our hope is in clover and better farming. C. C.

Waupun.

Wheat, corn, hogs, sheep and dairy products. Wheat has been up to a dollar and down to 60 cents. Hogs have ranged from $3 to $6 per cwt. Farmers who have the best products get the best prices. We used to raise considerable stock; but that does not pay. Farmers have gone into dairying--cheese and butter making. E. S.

Richland Center.

1 and 2 Pork, sold to the packers in La Crosse, 25 miles away, and cream sold on the farm to the Farmers' Co-operative Creamery at Holmen, eight miles off. Sometimes a little rye is raised. Corn and wheat are sold to grain dealers at the railroad stations.

3. Low and lower. Prospects threaten the lowest prices of all in the future by reason of glutted markets.

4. Yes, several: One, by being first in the market, ere the "rush" begins, stopping sales as soon as prices drop, and living so economically as to be able to hold his products for his own price, which he gets far oftener than a careless man would think. The others, by meeting the real demands of the market. For instance: yellow corn is purchased at the mills, to be ground for table use, and these men don't offer white dent there. They grow strawberries, grapes, melons, etc., for the stores, and make 10-pound, full-milk cheeses for sale, that go off "like hot cakes." They make gilt-edged butter and contract it for the season at an extra price when the cheese market gets slack, and are attentive to their business generally.

5. Very many. Small grains, potatoes, fat beeves, pork and veal used to pay; now they do not. Chinch bugs get the small grains, and sometimes invade the corn-fields. Beef is less than two cents per pound for the best. Pork and veal at four cents are too cheap. Potatoes and truck are drugs in the market.

The first change I would suggest would be a "Trade Union" of all the farmers in every town. Make the organizations as simple as those of school districts, town, county and State and as inexpensive as possible. A per capita tax of five cents per annum is quite sufficient, if we keep clear of lazy, lying place-men and demagogues. Meet often, say, at the schoolhouse one evening every week to discuss markets, crops, methods; making every meeting a regular "institute" for the elucidation of some one point pertaining to our business. Thus organized, we might diffuse a professional spirit in the farmers, control the output and the markets in some degree, and better our prospects in due time. There should also be in connection with the farmers' unions at their places of meeting, some arrangement for the exchange, purchase or sale of farm products. There should be half a dozen "bulletin boards" written up, say, as follows:

FOR SALE OR EXCHANGE.

4 horses by.....T. Day.
20 bushels seed oats by.....S. Roe.
10 " clover seed by.....J. Brown.

WANTED.

4 spring pigs by.....T. Day.
10 bushels seed oats by.....P. Roe.

Holmen. "DOT."

1. The cash agricultural products of this section are wheat, rye, oats, barley, buckwheat, potatoes and hay, together with dairy products, beef and pork.

2. These are mostly sold in our local towns to dealers and shippers, except where creameries or cheese factories are patronized.

3. Prices here average about the same as in Chicago and Milwaukee, with no very bright outlook for the future, as the prices for everything grown on the farm are going lower and lower.

4. Farmers who are selling their dairy products to consumers, and those who are raising extra-good cattle and horses, are the men who are getting prices that are above the average.

Much less wheat is raised here than formerly, as it is no longer a sure crop, and more dependence is placed upon the dairy and the raising of draft horses—a business which is beginning to claim the attention of many of the farmers in this section. Dairying and the raising of stock seem to be our only financial salvation. As farmers, we must raise better stock, in fact, the very best we can possibly produce, and do away with middlemen, wherever practicable, if we would have even a small margin of profit for our own labor and the capital invested. W. M. H.

Neenah.

FROM CANADA.

1. The products we depend upon for money are wheat, barley, peas, oats and stock.

2. They are sold mostly here and shipped to Eastern markets.

3. Prices ruled low for wheat until last year. The prospects for future prices are not very encouraging.

4. The farmers that get an extra price are those who raise a first-rate article.

5. Several farmers depend more on raising good stock and dairy products. They also give better cultivation, raise better stock, are more industrious and economical. D. T. S.

Bugden.

1. Wheat barley and peas.

2. Farmers sell to local buyers who ship wheat and peas to England and barley to the States.

3. Prices for wheat have ranged from 75 cents to $1.20; for barley from 45 to 75 cents; for peas from 50 to 75 cents. Prospects for this year are that prices will rule low.

4. A few good farmers by raising good samples of grain command the highest price.

5. Farming has not changed much during the past 10 years. H. F.

Wilsonville.

HACKNEY MARE, MOVEMENT. Fig. 155.

Re-engraved From The London Live Stock Journal.

1. Our cash products are, first, barley, then cheese and horses.

2. Our barley and horses are bought by local buyers mostly for New York State markets.

3. Prices have averaged very low for some years, with no prospect of a change for the better.

4. I do not know that any of our farmers get more than average prices.

5. Farming in this section has changed but little during the last 10 years, only we have improved implements to work with. Peas are coming to the front as a cash product. The A. B. Cleveland Co. has a branch establishment in this county and a good many farmers are sowing their peas, under a contract, at from 65 cents to $1.10 per bushel. I think a thorough system of underdraining would make farming more profitable. The prospects for crops are exceedingly good so far this year. S. S. M.

Prince Edward County.

1. Wheat The yield averages 30 bushels per acre, and for 10 years the price has averaged 75 cents per bushel.

2. At Lake Biers, the railway station.

3. The prices for four years have been: best No. 1 Hard wheat, 50 cents to $1.20; average 75 cents per bushel.

4. No one has got more than these prices; but some have got less, because it was not clean.

5. For two years farms have changed hands at advanced prices. As an improvement, I would suggest mixed farming. People ought not to run out their farms while they are still young. W. C. H.

Cypress River, Manitoba.

1. There are different classes of farmers in the vicinity of Montreal: 1. The milkmen who feed all they raise to their cattle and sell the milk in the city. 2. Those engaged in market gardening and orcharding, both of which vocations are practiced by the same persons with few exceptions. 3. Those who sell principally hay and potatoes.

2. These products are mostly sold in Montreal and Quebec. Occasionally we send potatoes and choice Fameuse apples to the United States.

3. Cheap railway accommodations have brought into the city garden produce, milk, etc., from a distance, and this has made the prices lower these past few years than they used to be.

4. Those who try to excel in growing and producing good articles and marketing them in tasteful packages will always get more than the average prices. I would suggest that orchardists should always brand their names on the barrels of fruit they sell, to establish a good reputation; the same as millers do with their flour.

5. The system of farming has not changed much; farmers have gone more extensively into the branches I have mentioned, and are apt to over-produce. If we only had free trade and could send our potatoes, etc., free of duty across the border in return for the vegetables that already come in free from the States, it would be more profitable. R. B.

St. Henry of Montreal.

1. Fall wheat and beans.

2. We sell to Chatham and the surrounding markets. There are three large flouring mills in Chatham and they use a large quantity of wheat for grinding and shipping to the Lower Provinces and the British market, and some wheat is sold to middlemen for the English market. More beans are raised in Kent county than in all the rest of Canada. They are sold to grain buyers. Large quantities of them go to the American market and the Lower Provinces.

3. Prices for all kinds of grain have been low for the last few years; but they were very good last year. The prospect for prices is better for the future.

4. There are a few farmers who get better prices for their produce than others, by being forehanded and not compelled to sell till prices are remunerative. They study this matter and practice good farming.

5. Farming has changed somewhat in the last 10 or 15 years. Formerly farmers used to depend mostly on grain; but now they practice mixed husbandry. We can grow the very best of corn, barley, peas, oats and all kinds of grain and fruits, such as apples, pears, peaches, plums, grapes, of the best quality, and large quantities are sold here yearly. We raise horses, cattle, hogs and sheep for shipping to the British market. The best change would be to consume all the grain on the farm except wheat and beans. By this plan, with good farming and plenty of manure that is made by keeping plenty of stock, farming would pay well, with the RURAL NEW-YORKER to guide us.

Chatham. A. MC D.

FROM IOWA.

1. Horses, cattle, hogs, dairy products, corn and oats

2. A great many heavy draft horses are raised in this section. They are bought and shipped East, mostly to the large cities. Fat cattle are also shipped to Chicago, and so are the hogs, which are mostly bought by local buyers. Those that are dairying sell their milk to the creameries, receiving back the sour milk which they feed to their calves and pigs. There are a few farmers who continue to raise corn and oats for money crops, which they sell mostly to the stock farmers in their neighborhood.

3. Prices have been good, but are rathe on the decline.

4. There are a few who raise full-blood horses and cattle, that get fancy prices for them; but I cannot say whether they realize

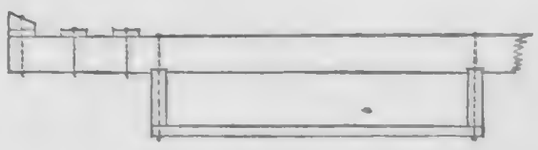

Fig. 154.

any more profit from their farms than their neighbors.

5. Farming has changed but little with the exception that more stock is raised and less grain is shipped. If farmers would go over less ground and do more thorough work, I think they would receive more profit from their work. A. B. T.

Monticello.

1. Hogs, cattle, corn, oats, and milk.

2. Some are shipped, but the hogs mainly go to our packing houses and the cattle are slaughtered. Oats go to our oat-meal mill, milk to the creameries, and a small portion of the corn is shipped.

3. Quite satisfactory; prospects good.

4. The prices realized are pretty uniform.

5. I think an improvement may be justly claimed, but there has not been much change in the kind of farming. Our farmers try to cover too much ground—they take off too much and return too little. Much of the manure that accumulates in our city goes to fill wash-outs, at the expense of cartage.

Cedar Rapids. A. C. K.

FROM INDIANA.

1. Corn, hay, oats, clover seed and wheat are the chief crops raised here, all of which are fed to stock except the last two.

2. Our stock are sold mostly at Cincinnati and Indianapolis. Some good stock are shipped directly East, having been sold to local buyers.

3. Prices of agricultural products have gradually decreased during the last few years except those of hogs. None of us can see a shadow of hope for better prices. Prospects for future production are good.

4. Prices are generally uniform and so are the products.

5. Farming has changed, for the work is more thorough, but there is plenty of room for improvement. T. E. H.

Greensburg.

1. Wheat, corn and considerable oats, hay and potatoes.

2. Local dealers usually buy all.

3. Prospects are not very flattering for farmers who try how much ground they can till; but for good farmers, small fruit and potato growers, prospects are fairly good.

4. Same prices are usually got by all, but those in debt and who hasten to sell usually make a sacrifice.

5. There has been very little change in 10 years, but potatoes and small fruit have been grown more extensively, and find ready sale, and some make them very profitable. Nothing could profit farmers more here than to work in harmony for their own interests.

Bourbon. J. H. P.

1. Wheat is now and always has been the staple money crop; but corn, oats, vegetables and stock of all kinds are very profitably raised.

2. Farm products are usually sold at home to men engaged in the purchasing business; some of them are commission agents, but most of them are men who use their own capital.

3. Prices for all farm products have generally been low and the prospects are not very encouraging.

4. It is very seldom that farmers get more than the market price for anything except for butter, and when they do get more it is on account of the superior quality of the product.

5. Farming has changed considerably in the last 10 years, principally in the raising of more corn, oats and stock. Farmers are learning that it is more profitable to feed stock and use up all their grain and rough feed on the farm than to ship the grain and waste the rough feed. One of the best and most profitable changes for the farmers would be for them to organize themselves into companies and all stand for each other as one man. J. S.

Lima.

1. Mainly wheat, corn, potatoes and small fruits.

2. Dealers in our home market buy the products.

3. Prices are low when crops are good. Prospects for the future are fair for a first-class article.

4. Some find a readier sale for their produce, by offering a first-class article in proper shape but very little if anything is obtained above the average price.

5. More are going into growing potatoes and small fruits. Five acres of potatoes are planted now to one 10 years ago. Some expect to make a success with small fruits regardless of having a liking for the business.

South Bend. T. A. P.

1. We depend principally for money upon corn, using wheat, oats, barley and rye to change the land.

2. We sell the corn to our grain-dealers, also to starch factory and cannery.

3. Average price of corn 30 cents; rye 40. Copious rains have made the future prospects for crops at present very flattering. If the harvest proves fine it is hard to tell what prices will be.

4. Farmers who can hold their grain get from the average to the highest prices.

5. Farmers seed their land to clover and Timothy, feed their farm products to hogs and cattle and depend more on grass crops than in the past. To obtain better results foul land must be restored by seeding to grass and the most profitable stock must be produced. Deeper plowing on old land would be a good change, and if farmers would use more fertilizers and raise more vegetables their profits, comfort and health would be increased. T. R.

Atlantic.

FROM NEW JERSEY.

1. Milk, hay, potatoes, rye straw, green corn, truck, apples, cider, vinegar, small fruits, poultry and eggs.

2. The products are sold in the small towns around, or in New York. Some sell to consumers, to store-keepers, and to buyers who gather up and take to Newark.

3. Prices have averaged fair the past few years. The prospects for future look dull to me.

4. The farmers who get the best prices sell good articles to consumers.

5. I think farming has not changed much in the past 10 years. We are not good farmers here. A number act as agents for machinery, fertilizers etc., or do team work. The general opinion is that "farmin' don't pay" well. I think there is need of more manure, labor and brains. Too many farms are rented and skinned; the land is strong and somewhat hilly. C. R. W.

Westfield.

1. All that may be included under the term "truck," more especially early potatoes, tomatoes, canteloupes and sugar corn; also late tomatoes of which a large percentage are contracted for by local canneries, and small fruits, more especially strawberries. Late cabbages have been increasingly raised and until the last year at a good profit. Probably one-third of the farm profits hereabouts is derived from dairy products, chiefly in the form of milk.

2. The greater part of all these is consumed in Philadelphia and Camden and their environs. Strawberries and late cabbages are largely shipped to distant points by commission dealers.

3. Prices have averaged very near the starvation point for encumbered farmers for the last three or four years. Where one article has brought a fair profit, there are two that scarcely pay the cost of production. Future prospects of better times are based wholly on uncertainties mainly the weather. The past year has proved that a season of universal moisture is a boon solely to the consumer in its first effects. As to the future, some farmers are being driven out and this may help those who are able to remain; but there are many other factors to be considered ere a man can exercise the gift of prophecy to advantage.

4. Of late years, those who have produced goods of a superior quality have often found that the highest prices received were not, as formerly, in proportion to the increased cost of production. Nevertheless, it is only those who aim at the highest quality consonant with a paying quantity, who get along at all.

5. Our farming methods and the character of farm products have materially changed in the last decade. Southern competition in early fruits and vegetables, combined with the enormous increase in city populations, has diminished the interest in early trucking and increased proportionally the dairy interest of our locality. In the highly perishable class of small fruits and vegetables, Southern competition cannot materially affect the home market for home products, and hence the demand for and production of these are ever on the increase. The immense canning industries of our State conduce to the same end. S. M. S.

Haddonfields.

FROM CONNECTICUT.

1. Milk, butter, poultry and general farm crops; small fruits, large fruits, and all kind of fruits possible to raise.

2. Milk, poultry, eggs, butter and a great deal of produce are sold direct to the consumers, large gardeners and stores.

3. Prices have been good to fair. Good, fresh produce generally brings a fair price.

4. Yes; by being first with everything in its season, dealing honestly and selling to the consumer for cash.

5. There have been many changes, with the young men especially. A good creamery would bring profit both to farm and farmer.

Birmingham. G. M. D.

FROM ALABAMA.

1. In spring, vegetables, such as potatoes, cabbages, peas, beans, cucumbers and tomatoes; in fruits, such as strawberries, plums, peaches and pears. I won't state the prices obtained as they might look too big.

2. Our products are sold in Western cities through commission merchants.

3. Prices have averaged good for the past few years and the prospects are good for all that can be raised in the future, because not one acre in 100 is under cultivation.

4. Some of our farmers generally get prices above the average, usually because their products are nicely assorted and packed in good shape.

5. Farming has changed very much in the last 10 years, owing to new facilities for shipping and the remunerative prices obtained for vegetables and fruits.

6. Yes, our lot would be much better by the destruction of those abominable frauds called express companies.

Let the railroads give us rapid transit at reasonable rates, and let Congress initiate the movement by amending the postal laws so as to give us a parcel-post at about four cents per pound. Such a law would not affect vegetables and fruits, but it would everything else. C. C. W.

Grand Bay.

FROM WASHINGTON.

1. This immediate neighborhood has been settled but a few years, and a large part of the people have not cleared enough to make a living on the ranch, so they work out in logging camps to raise money. Those that make money for support at home, make it on hay and cattle; but there are few of them.

2. To lumbermen.

3. Prices are good, and prospect very good.

4. So far, prices are about equal for all.

5. No changes have been made. Farmers still raise oats on the diked tide lands; fruits, vegetables and hay, on the river valley lands. There will be many changes, however, as the country develops, and transportation becomes more convenient. This valley is heavily timbered, and most of the people came here poor; but the climate and soil are hard to beat. No such thing as failure is known, and coal, iron, and gold are found, the two former in abundance, and there is no end to the lumber supply. Money seems to be pretty plentiful. Immigrants are coming in large numbers. R. H. P.

Mt. Vernon.

FROM MICHIGAN.

1. Wheat, wool, beef and pork.

2. Wheat and wool are sold to elevators, and beef and pork are sold on foot to drovers.

3. Prices of wheat, wool and pork were in 1888 better than usual; but those of beef were very low. Calves are selling for $1 to $3 apiece now. The future looks bad. Farms are selling low.

4. None.

5. There has been a change this year to the production of early lambs by using a Shropshire buck on Merino ewes. We are also raising more coach and carriage horses. Farmers stick steadily to mixed farming.

Almont. J. F. F.

1. Wheat, hay and wool.

2. Wheat is sold to the millers and shippers; hay to shippers at the railroad stations; wool to the woolen mills and to Eastern buyers.

3. Wheat has brought from 70 cents to $1 18 for No. 1; hay from $6 to $16 per ton; Wool, unwashed, 12 to 20 cents; washed 20 to 40 cents, according to quality. Prospects for wheat and hay are good.

4. The better the farmer the better the grain and price.

5. Farming has grown better; we have better stock, and building improvements are made every year. Perhaps dairying would pay if properly managed. We have creameries in the county, but they claim to pay only expenses. I. G. D.

Grand Blanc.

FROM NEBRASKA.

1. At this point corn and oats are the main crops, with occasionally some flax. Very little wheat is raised on account of low prices and poor yields.

2. The corn is sold to cattle feeders and some of the farmers feed it to stock themselves.

3. Prices for corn and oats have ranged from 15 to 40 cents. Some corn and oats last year sold for 40 cents; they are selling now at 20 cents per bushel.

4. Those who get more than the market prices are men who are able to hold their crop until corn becomes scarce.

5. I don't think there has been much change, only in raising wheat. The price of the crop has been so low and the yield so poor that very little has been raised for the last two years. The price of wheat has been from 30 to 50 cents; but good wheat is now worth 85 cents. J. M.

Gibbon.

FROM SOUTH DAKOTA.

1. Wheat and flax seed.

2. We sell to warehouses in the towns, owned and run by large grain companies.

3. The average prices have been about 50 to 60 cents for wheat; $1 for flax. Farmers will get better prices by having their own warehouses, as they are beginning to do through their "Farmers' Alliances."

4. Yes, by having clean, sound grain to sell.

5. There have been no changes as the country has been settled only six years. Still farmers are raising more corn, as they are finding it pays well. C. H. S.

Holabird.

1. In the Black Hills farming is conducted as a side issue to stock raising.

2. We have a handy market at our mines of gold, silver and tin, for our surplus cereals and vegetables, and we ship fat stock and wool East.

3. Prices have been good in the past and prospects look brighter as our mines are becoming more developed.

4. No.

5. Not much has been made. As in all new places, we scratch the ground a little, put in the seed and trust to luck. Wool raising is my source of revenue. J. W. B.

Hermosa.

FROM ILLINOIS.

1. Strawberries are the principal products, then oats and the products from a little mixed farming.

2. In Chicago and towns north of it by commission merchants.

3. The prices have been low and prospects are very dull.

4. A few, by having something that is fancy.

5. Farming has changed a little. Years back we raised wheat as the principal crop and some hogs. Then the chinch bug became so troublesome and prices so low that almost every one quit raising wheat. There seems to be an opinion that more meadows would be better for us here. J. K.

Centralia.

1. The products of mixed farming.

2. At the nearest shipping points where they are bought by commission dealers.

3. Prices have been very low with the exception of pork, which has been from four to five cents per pound. Cattle have not paid expenses. Horses have been profitable: quite a large number have been shipped from here to St. Louis, Kansas City, Denver and to the Eastern markets.

5. Improved machinery, a more thorough cultivation, a better knowledge gained from reading agricultural papers, have caused a great change in farming. No paper in my estimation is equal to the RURAL NEW-YORKER. J. T. H.

Mendon.

1. We depend principally on corn and hay in connection with stock raising.

2. A large portion of the corn is fed to hogs, which are sold to local buyers, or middlemen who ship them mostly to Indianapolis. The corn not fed at home is sold to local grain dealers at the nearest shipping points. Hay is sold to dealers at the nearest points, who bale it and ship it mostly to the Southern markets.

3. The average prices for the last four years have been as follows; hogs live weight $4.50 per 100 pounds; corn about 28 cents per bushel; hay from $6.00 to $10.00 per ton, according to quality, averaging probably $8.00 at home.

4. By securing a good, clean, well-cured crop of Timothy hay cut at the proper time, say, as soon as the bloom is off, farmers may get an advance of, say, $2.00 per ton on the above prices, and an advance on hogs by having the best of well-bred stock well fatted.

5. Down to 10 years ago farmers depended mostly on raising wheat and selling it and other grains to grain dealers to get cash. Now they feed more of their grain on the farm than heretofore, thereby increasing the amount of manure and increasing the value of their products. I would suggest that if the farmers of this section would turn their attention more to sheep raising and the dairy, and to the improving of their breeds of cattle, they would make more money, and get better prices. The average prices for almost all farm products are low at this time: corn 25 cents; oats 18 cents; wheat 75 cents; potatoes 0,00; hay $6.00 to $7.00 per ton in the stack or barn; sheep $2.00 to $3.00 per head, clipped; wool 24 to 26 cents per pound. Cattle, butchers' stock $2.50; the shipping grades $3.00 to $3.50 per 100 pounds. E. J. M.

Shelbyville.

1. Southern Illinois, or this part of it, is pretty evenly divided between timber and prairie land. The ways or means of raising money are many; not one alone would do to depend on. On the prairie, Red-top, oats, and cattle; on the timber, wheat, clover-seed, hogs and cattle.

2. At our nearest railroad stations, five of which are about equally distant—nine to 12 miles—to local buyers.

3. Wheat from 65 cents to $1.10 per bushel; Red-top seed 35 to 75 cents per bushel; clover seed $3.25 to $5.50 per bushel; oats 15 to 30 cents per bushel; hogs from $3.25 to $6.00 per 100 pounds; cattle from $2.00 to $5.00 per 100 pounds. One year ago last fall Red-top seed brought only from 20 to 30 cents per bushel, which did not pay expenses. Cattle are very low at present, but we hope for better prices.

4. A few farmers make more money than the others by pooling and selling their products in large lots, saving the buyer much time and trouble.

5. Timothy and clover are taking the place of wheat, tobacco and Red-top. Dairying too,is creating much interest in this neighborhood. Owing to the low price of cattle and Red-top seed, the ravages of the Hessian fly and chinch bugs, we will have to change our mode of farming, or depend wholly on our wives to support the family and pay the taxes with poultry and eggs, which command a very good price. J. N. R.

Mount Erie.

1. Hogs, cattle, dairy products, corn, oats, hay, potatoes, tobacco, melons, in about the order named.

2. Most of the grain, hay, etc., is fed by stock raisers, and only the surplus is hauled to the nearest towns. Stock are generally sold at the handiest railroad station to buyers who make a business of buying and shipping to Chicago. Tobacco is often shipped to St. Louis, or Cincinnati, Ohio.

3. Prices seem to be very unsettled, and this is caused, I think, by stock and grain gamblers and speculators. Prices are generally so low that it is only by the best management, and by a lucky sale when prices are up, that the common farmer can make a profit. If the enormous sums wasted for cursed drink could be turned into the honest channels of trade,prices would soon be better, as drunkards' families are, at present, poor consumers of healthy food and clothing.

4. Some farmers made money two or three years ago forcing calves for market at 10 or 12 months old. They began to feed, as soon as the calves would eat, plenty of oats, corn, bran, oil meal, etc., besides letting them run with the cows till four or six months old, and when the animals were sold they weighed from 700 to 900 pounds per head, and brought from four to six cents per pound. But this seems over-done, and prices now are three to four and a-half cents.

5. There has been no change in farming except in raising tobacco, which is comparatively of recent introduction here; but it doesn't show such profit on paper as it did a few years ago. Raising pop-corn would be profitable if prices would remain as they were last fall in Chicago—1¾ cent per pound in the ear. We can raise easily 1,400 to 2,100 pounds per acre. Potatoes have no sale at present; but I believe they would be worth 20 cents per bushel to cook for hogs, if corn were at its usual price of 40 cents instead of 25 cents. Large profits are made by good breeders who raise and sell thoroughbred cattle and swine. W. S.

Pleasant Valley,

FROM OHIO.

1. Cheese, butter, wool, pork, veals and sheep, and some wheat.

2. At Youngstown, Buffalo and Cleveland.

3. They are yearly going down in value.

4. Some get extra prices for butter, factory-made, and that from the best farmers.

5. More artificial manures are used, and more potatoes are raised. Here on the Western Reserve, cheese is most depended upon unless near Cleveland, where milk is sold. I think we are doing better farming than we did 10 years ago. The RURAL may help some.

Gustavus. H. H. K.

1. Most farmers here depend on wheat, oats and milk for cash.

2. The wheat and oats are sold mostly at the mills here and in Akron (the Akron mills are numerous and large); the milk, at the various cheese factories in the county.

3. The price of milk has varied from five to 15 cents per gallon of 10 pounds, the average being about seven cents for summer and 12 cents for winter.

4. A few farmers get extra prices on milk by shipping or carrying it to milk depots, hotels, etc., in cities.

5. Farming has changed but little in 10 years, and the same crops are grown. Potatoes are grown quite largely now, but last year's glut will probably discourage many.

Cuyahoga Falls. W. S. C.

1. Maple sugar and sirup, with fruits, wheat and potatoes.

2. We have home markets at Garrettsville, and at the Mahoning Valley Iron Works.

3. Prices remain about the same with very little variation. The future does not look very bright, there seeming to be an overproduction in all farm products except the maple products whose area is limited, and whose production cannot be overdone.

4. There are some farmers who have built up a trade in sirup, and can, box and ship sirup directly to regular customers at an advance of 50 cents per gallon. Some by use of cold storage keep apples till they are out of the regular market and get better prices, but they do not claim any great advantage by so doing.

5. Ten years ago this whole section was strictly devoted to dairying and sheep husbandry. Now not one in 10 of the old factories is running. They are rotting away, having been forsaken by owners and patrons. Our best cash crops consist of maple products which are about the only things that bring us any profits. Farmers should form a vast trust and demand "living" prices for their products. They have the power to do so, if they would only combine. L. M.

Garrettsville.

FROM MINNESOTA.

1. Oats, barley, potatoes, hay, good horses, beef, pork and dairy products.

2. Mostly east—at Chicago, New York,etc.

3. Prices for stock, horses, beef, pork and dairy goods have been fair.

4. The most prosperous farmers are those who produce a good article and ship it direct to the consumer.

5. Farmers have changed from wheat-raising to diversified farming, with stock in the lead. J. A. T.

Austin.

1. The principal crops are wheat, oats, barley and corn.

2. Corn is fed to cattle and hogs and these are sold to the butchers and shippers. The other grains are sold at the elevators.

3. Prices for the past few years have been very low except last fall, when wheat was high. The men who have the best of everything get the highest prices. "X. L."

Winona.

1. Wheat.

2. At the railroad station to the elevator company.

3 The price is $1 per bushel. Prospects are fair for a good crop; but prices are likely to be lower.

4. Some do; it depends on the location of their land, and how they work it.

5. Not much. Some have come in to raise stock which doesn't pay very well yet; but it will be better after a while. There is not much blooded stock in this section yet. We will have to raise hogs and stock as wheat is running out. J. F. M.

Ottertail.

RURAL SPECIAL REPORTS.

Georgia.

SUMMERVILLE, Chatooga County, May 30.—We had a very mild winter. Wheat and oats came through uninjured by cold. The grain is plump and fine—as good as I ever saw it. Fall oats will be light; spring oats short, but the grain of both will be good. We have had a very dry spring,but we have had a fine rain to-day all over the country, which will be a great thing for spring oats and for all farm crops. Wheat is ready to cut now; it looks almost as yellow as gold. Fruits of all kinds are in the greatest abundance. Peach trees are so heavily loaded that they are breaking to pieces. My Niagara grapes are as large as No. 1 buckshot. The cotton crop is late on account of cool, dry weather. Corn looks well, but it is small. Some have not finished planting; while others have corn waist-high. This North Georgia is a fine country and there is plenty of room for some Northern farmers and Northern capitalists; they are surely coming, too. J. C. H.

Washington.

DAVENPORT, May 20.—I have lived here for seven years and never saw a better prospect for crops than at present. Many are coming here from the East, and most of them are much disappointed. Good land is about all occupied, and for the man without means this is no place. S. C.

Entomological.

DISAPPEARANCE OF THE COLORADO POTATO-BEETLE.

IT is now about 30 years since the Colorado Potato-beetle first appeared in Iowa and about 25 years since it crossed the Mississippi river in its march eastward. The beetles were first collected in their native home at the base of the Rockies on the upper Missouri in 1819 by Thomas Say, Zoologist of an exploring expedition sent out by the U. S. Government to the Northwest Territory. Only a few of the beetles were seen and these were feeding on a wild plant, Solanum rostratum, belonging to the same genus as our common potato, Solanum tuberosum. The marvelous increase and spread of this insect over the entire country were due,principally,to the increased food supply brought to them by the introduction of the potato by the settlers without a corresponding increase of their natural enemies. Not only has the Colorado Potato-beetle spread to all parts of our own country, but it has crossed the Atlantic and is already doing much damage in Europe. During all of the years that this beetle has been with us, its myriads of egg-clusters and plump, juicy larvæ, or young, have furnished abundance of delicious food for predaceous insects which, in their turn, have also increased in numbers.

I do not remember to have seen it stated that the potato-beetles were very greatly on the decrease over large areas. I came to Iowa from Michigan one year ago, and was surprised to find so few Colorado Potato-beetles, in the vicinity of the Iowa Experiment Station. I do not think that I saw a-half-dozen of the adult beetles during the entire summer although I made special search for them on several occasions. On inquiring of old residents, I was told that the "potato-bugs" had been on the decrease for several years. At the present time the potatoes in my garden are nearly knee-high and the tops are badly punctured by the little black Flea-beetle (Haltica cucumeris) that did so much damage in many places last summer, but I have not seen a single "potato-bug" anywhere. Last winter the Station sent out a large number of question sheets to the farmers of Iowa, making inquiry concerning certain injurious insects. Out of over 300 replies to the question: "Have the Colorado Potato-beetles done any damage in your vicinity the past summer?" more than half were in the negative.

To the question: "Are they as numerous as they used to be?" only 26 replied in the affirmative, and these replies all came from the northern and eastern parts of the State.

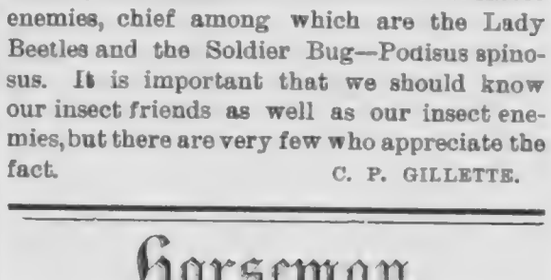
I think there are two principal causes for this great decrease in numbers of the Colorado Potato beetle first, the free use of the arsenites, London-purple and Paris-green; and, second, the increase in numbers of its insect enemies, chief among which are the Lady Beetles and the Soldier Bug—Podisus spinosus. It is important that we should know our insect friends as well as our insect enemies, but there are very few who appreciate the fact. C. P. GILLETTE.

Horseman.

HACKNEY MARE "MOVEMENT."

See page 141.

THE R. N.-Y. has frequently printed pictures of Hackney horses and described them so well that our readers know the main points of interest about the breed. This week's picture is given—see Figure 155—because it shows one of the most remarkable horses of the kind in England. It would seem at first sight that the remarkable color of this mare—known in England as "skewbald"—would fit her for the circus rather than for competitive exhibition for a high place in the ranks of a breed of horses that are remarkable for solid colors, yet this mare has beaten every rival that has appeared against her. When at rest she is described as an "insignificant-looking little horse," but when harnessed and hitched to a cart, she shows a style and energy that are remarkable, considering her age and the service she has seen.



ANSWERS TO CORRESPONDENTS

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

TAPHRINA PRUNI: A FUNGUS ON PLUM TREES.

E. T. I., Marshallton, Pa.—What is the fungous growth on the inclosed twigs of the Miner and Wild Goose plums? The pest first appeared here two weeks ago, and is spreading quite rapidly. The Miners have the thriftier growth, but are suffering most. It looks as if everything would be destroyed. The pest first appears on the stem of last expanded leaf, and then extends to the off wood of the branches.

ANSWERED BY E. A. SOUTHWORTH, ASSISTANT MYCOLOGIST, DEPARTMENT OF AGRICULTURE.

The twigs in question are the victims of a fungus known to botanists as Taphrina pruni. It is closely related to the fungus that causes the disease of peach trees, known as "peach curl." On the plum it generally attacks the fruit, causing what are commonly known as "plum pockets," but occasionally, as in this instance, it also attacks the growing branches. Similar cases have been reported from the South and from Iowa. The fungus is itself a plant that grows within the tissues of the twig and produces its fruit on the surface. The powdery patches seen on the deformities are masses of spores, each of which is capable of reproducing the fungus and causing the deformity of another twig. The part of the fungus growing within the tissues is the mycelium, or vegetative part of the plant, and is composed of fine, branching threads of microscopic size. By their presence, they so irritate the unlignified parts of the twig as to cause excessive growth and so produce the deformities. The presence of this fungus is quite independent of any fertilizer that can be applied to the roots, but is dependent to a large extent on a proper condition of the atmosphere, heat and moisture being necessary to the germination of the spores, and to the infection of new shoots. When infection has once occurred, however, the fungus can develop under any ordinary conditions, and the mycelium will live over winter in the woody parts of the stem, and in the spring will grow out into the young shoots. In order to get rid of the fungus, it is necessary to remove and burn every diseased shoot as soon as it makes its appearance. In doing this, it is best to cut back the branches so as to destroy all parts which are likely to contain the mycelium of the fungus. Instances are known where this process was followed for two or three years with decidedly beneficial results. If, in addition to this, it is desired to disinfect the trees so that spores falling on the leaves or stems will not germinate, the following method of treatment may be used: Spray the trees in the spring before the leaves come out with a solution made by dissolving two pounds of sulphate of iron in five gallons of water. This would destroy any spores lodged in the crevices of the bark. Spray the foliage two or three times during the summer with a solution made as follows: Into a vessel having a capacity of one gallon, pour one quart of ammonia (strength 22 degrees Baumé), add three ounces of carbonate of copper; stir rapidly for a moment, and the carbonate of copper will dissolve in the ammonia, forming a very clear liquid. For use, dilute to 22 gallons. Use a good force pump with a fine nozzle, and make the applications after sun-down. The simple cutting back will, however, if persisted in and followed up on *all* the diseased trees at once, probably be sufficient. An illustrated account of the fungus will be given in the Annual Report of the Department of Agriculture for 1888.

RATION OF SILAGE AND SUPPLEMENTARY FEED.

Several Subscribers.—How much silage should be fed to a cow and what sort of grain is best fed with it?

ANS.—There appears to be no such thing as a standard analysis of silage. The materials of which the silage is made vary so much in composition and the silage itself is made under such varying conditions, that a standard analysis seems out of the question yet. The Wisconsin Experiment Station directors have printed a list of grain rations that may be fed with silage. The R. N.-Y. could do no better than give them here. These are daily rations, and the cow is expected to eat, with the grain, 40 or more pounds of silage from well-matured, well-eared corn.

ABOUT TWIN CALVES

R. L. K., Licking, Washington.—Will twin heifer calves breed? I have been told that they will not; if so, what is the reason?

ANS.—Yes. It is safe enough to conclude that both will breed. Your informant probably meant that where twins are born, one a heifer and the other a bull, the heifer is usually barren. Such heifers are known as "free-martins" and they are generally unable to breed. The rule is not absolute, however. About the time your letter reached us, one of our friends in Livingston county, N. Y., sent us the following account of a fertile free-martin, which he knows to be correct:

"Two years ago next month one of the best cows I ever owned (grade Short horn) gave birth to twins, the get of a Holstein bull. The bull calf was sold to the butcher for veal, and the heifer, which was born first, and the larger by 10 pounds, I raised, together with four others, the get of the same bull. She has grown well and developed into a fine animal. She gave birth the 19th of the present month (April) to a bull calf, which weighed 90 pounds, and is doing finely. She has a large udder, prominent milk veins, and, so far as I can judge, bids fair to excel in all points, her half sisters of the same age."

BREEDING FROM CROSS-BRED BULLS.

W. J., Glendale Farm, Md.—I have a fine bull calf from a thoroughbred Holstein bull and a thoroughbred Alderney cow. Will it be as good a bull for breeding purposes as a thoroughbred, or would such a cross tend to deteriorate rather than improve the general qualities of milking cows?

ANS.—We presume Jersey is meant by the word Alderney. A cross between a Holstein-Friesian bull and a Jersey cow might partake of the character of one parent in preponderance to that of the other; or it might fairly represent both. This uncertainty is the most serious objection against cross-breeding and the use of cross-bred bulls for breeding. Such a bull would certainly not be so good as a thoroughbred, but it would be better than a grade of either breed, that is, a cross between the pure-bred and a native; and while it would not improve the stock so much as a thoroughbred, it would not deteriorate it, as its good blood would have some useful effect. Sometimes excellent strains of cross-bred cattle have been made in this way by wise selection.

GETTING RID OF SPARROWS.

F. K. P., Delevan, Wis.—Can the RURAL help us with regard to the sparrow pest? In a village corporation here, an ordinance against shooting birds, though daily broken, is never enforced. But to lessen their numbers I have to be a law-breaker. I have lamed my arm stoning sparrows to very little purpose. Last year there was no ordinance against shooting them, and by doing so I had very little trouble from them. Is there any help in noiseless powder, air-guns, or what? Or is the benefit from shooting, as some claim, due principally to the loud noise of the reports?

ANS.—Shooting is not a good way to rid ourselves of sparrows. Shooting drives other birds away. If shooting is practiced it should be in winter when most of our useful birds have gone south. The better way is to snare or poison them in winter. This may be done so as to cause no mischief and yet clear out the sparrows with a guileless conscience.

A BLUNDER TO BE AVOIDED.

W. D. G., Clintondale, N. Y.—As there appears to be a diversity of opinions as to the meaning of "sulphate of copper" in the composition of the Bordeaux Mixture, a remedy for rot in grapes, the RURAL would, no doubt, help some of its readers by telling whether real sulphate of copper (blue vitriol) or sulphate of iron (copperas), which is also sometimes called sulphate of copper is meant. As there is a wide difference in the prices as well as in the effects of the two, no doubt should be allowed about the matter.

ANS.—A deal of mischief, no doubt, has been and will be done by such blunders as those here mentioned. The Bordeaux Mixture is copper sulphate or blue vitriol, not sulphate of iron. Sulphate of iron is green vitriol or copperas. The Bordeaux Mixture is lime and copper sulphate.

Miscellaneous.

E. C. A., Aberdeen, Dak.—For ticks on sheep, use Thymo-cresol, manufactured by T. W. Lawford & Co., Baltimore, Md.

R. C. F., New York.—The New York State Experiment Station, Geneva N. Y., will make analyses of chemical fertilizers for farmers in New York State.

C. H. H., Brightwood, Ind.—In a late RURAL an item told us that potatoes were raised at the Michigan Agricultural College at the rate of 182 bushels per acre from whole "seed;" how large were the "seed" potatoes and were the plants thinned out after they came up or not?

ANS.—Professor Johnson of the Michigan College, informs us that the potatoes were of medium size and were not thinned.

G. W. T., Birmingham, Conn.—1. What is the cause of the injury to my Snyder blackberry leaves, samples of which are inclosed? 2. What is the best way to get rid of rose-bugs on grape-vines?

ANS.—1. The trouble is caused by the so-called "orange rust." All that can be done is to cut down and burn the infested plants. It attacks the wild as well as cultivated kinds. 2. The R. N.-Y. uses Buhach or pyrethrum powder—one heaping table-spoonful to two gallons of water. Spray the vines through the Nixon or Cyclone nozzle. Repeat daily.

DISCUSSION.

CURING HAY: THE HAY-LOADER.

C. S. RICE, LEWIS COUNTY, N. Y.—To save labor and expense, Mr. Terry cuts his heavy clover when he is very sure of fair weather, rakes while it is quite green and lets it cure in the windrow; Prof. Roberts with quality in view and plenty of labor at his command, cures his hay in the cock and uses hay-caps when deemed necessary, as set forth in the RURAL'S recent Hay Special.

It would probably trouble an expert to distinguish samples which could be the results of these different methods of curing. When the cost is considered, there is quite a balance in favor of the windrow system, but in my own experience it was not cost alone that led me to abandon my former practice of cocking all or nearly all my hay. The change was made when it was very difficult to get help to secure the crop in its season of greatest value for feeding. We try to secure hay when no rain is likely to fall just after it is cut, but if an unexpected shower should find a windrow exposed, the damage is not so great as that incurred by allowing the crop to stand when the clover or Timothy is allowed to stand a week or two too long. If grass that will yield two tons of hay to the acre is cut after the dew is off and before noon, and raked between three and five o'clock, the windrows may be turned over at 10 the next day, and drawing may commence at one o'clock. On the older meadows where there is but little clover, it is not always necessary to turn the rows, and frequently a load or two will be in condition to draw before dinner.

I use a low wagon with broad tires, with a rack 16 feet long and eight wide, a strong team, a good hay-loader, a double harpoon fork, and have large bays in which to unload. The loads will average a ton and a-half, and in an emergency, with two or three hands on the load, a large amount of hay can be secured in a short time. I do not mow in doubtful or catching weather; but work at repairs or in the potato or corn fields, and by using the loader and drawing from the windrow I am able to secure the hay crop in excellent condition and in fair season. I do not often sell hay, but I have at different times sold Timothy from a mow 30 feet square for an extra price on account of its brightness and freedom from dust.

With three good, strong, willing men hay can be quickly loaded with the hand fork, but such men cannot always be had, and more hay can be handled in the same time and with far inferior help by using the loader. To illustrate the value of this implement, I will state that 13 years ago I had something more than 100 tons of hay to harvest. Soon after beginning, my son was taken sick and was unable to labor for months. I had a very good hand 19 years old, and a boy 16 years old. I could not get other help. I was not able to pitch by hand or ride the mowing machine, but could drive the team with the loader and could handle the harpoon in unloading.

The hay was secured with this weak force in good season and without serious damage by rain, thanks to the hay loader. On one occasion I had about four tons of fine hay in the windrow fit to draw at half-past three on Saturday afternoon, and 30 cows to milk. I thought that I could place the hay in the barn in as short a time as I could cock it as the fineness of the hay was no hindrance to the loader. I made three loads of it and had it safely in the barn and the cows milked by sun down. The team went the length of the rows—about 40 rods—without stopping. With ordinary ability and carefulness in judging of the weather, hay can be nicely cured in the windrow at far less cost than when cocked. By the use of the hay-loader it can be placed in the barn in good time with help wholly inadequate to care for the same amount with the hand fork. I have owned the loader 15 years, and have used it 14 seasons for an average of about 100 tons each year. The cost for repairs has not been more than one dollar for the whole time.

Whatever others may think of the hay-loader, I value it as holding an important place among the improved implements that enable the farmer to accomplish his labor in less time and with less expense than in former years.

VALUABLE WHEAT EXPERIMENTS.

V. A. S., BENTON HARBOR, MICHIGAN.—About October 2 or 3, 1887, after removing a potato crop grown on Timothy sod, in a clay loam soil, I planted, with a roller drill, in a young orchard, one and one-half acre of wheat (Hybrid Mediterranean,) one bushel to the acre, the drill rows being 16 inches apart, in order to facilitate cultivation, which was practiced several times, at the rate of eight or 10 acres a day, and with most gratifying results as to the growth of the crop. The treatment for the experiments was as follows:

First, one space between the trees had been manured from the barn-yard in spring, for the potato crop. This was mulched in November with wheat straw four inches deep. Second, a space was manured as above, but not mulched. The remainder of the field received no manure in the spring, and no mulch in the fall. Third, a space was dressed with ashes from Chicago smoke-houses at the rate of four tons to the acre, at seeding time. Fourth, a space received commercial fertilizer from Chicago at the rate of 800 pounds per acre, at seeding. Fifth, another space got no fertilizer or manure whatever. Sixth, a space was top-dressed with half rotted barn-yard manure at the rate of 12 tons per acre, and it was harrowed in with the spring-tooth before seeding. On four additional spaces completing the field, nothing was applied. The season was cold in winter, freezing and thawing in spring, and very dry in summer. The yield was 25 bushels to the acre.

The results were carefully noted all through the season and were marked as follows, the lowest grade being six:

1st space, spring manured and mulched, No. 1.
2nd space, spring manured, no mulch, No. 3
3d space, ashes at seeding, no mulch, No. 3.
4th space, phosphate at seeding, no mulch, No. 4.
5th and four last spaces, no extra treatment, No. 6.
6th space, top-dressed from barn-yard at seeding, No. 2.

The mulched space showed much the best stand, and made the most wheat. The space top-dressed (from barn-yard) showed the darkest color and strongest growth, but lost a little by freezing; otherwise it stood No. 1. There was a perceptible difference between the space treated with ashes and that receiving phosphate (cost the same,) in favor of the ashes. The stand on about one-third of all that part of the field not mulched and not top-dressed from the barn-yard was frozen out.

Conclusions as to how to grow the best winter wheat crop here in Michigan:—Sow about September 15, one bushel to the acre; drills 16 inches apart; top-dress from the barn-yard; mulch with wheat straw, buckwheat straw, potato-vines, marsh hay, etc. Rake off the mulch with a sulky horse-rake, about April 1; cultivate till the wheat is 10 inches high. With fair soil such treatment will bring from 30 to 40 bushels to the acre, as was proved in the experiment above given.

THE PARKER EARLE STRAWBERRY.

W. B., DAYTON, OHIO.—By to-day's mail I send the RURAL samples of berries which I bought for Parker Earle. Of late I have seen several notices of a berry which it is proposed to call Parker Earle. As there is already on the market a strawberry of that name, introduced several years ago by Mr. John T. Lovett, it seems to me undesirable to put another of the same name out, unless it is much superior to the one already introduced. My berries are early, and these are not fair samples, as they are not half the size they generally attain, owing to a severe frost on May 23, when they were just in bloom. With me they are long in shape like Haverland, only not quite so pointed. When fully ripe they are a dark crimson, slightly acid in taste, and very firm. The vine is more productive than the Sharpless; but not enough so to make it a good market berry. Under glass culture the productiveness, size and flavor are improved and from my tests I am inclined to think this the best berry for forcing that I know of The leaves are more distinct than those of any variety I know; though they look weak, they retain their color until frost. Their variegated look remains under all conditions. Does this description correspond with that of the Parker Earle known to the RURAL?

R. N.-Y.—The berry sent was named Parker Earle. It was tested at the Rural Grounds before it was introduced, and reported upon. It may be good for forcing, but it has no distinctive merits otherwise. It was therefore proposed to discard it. The new Parker Earle is not yet for sale. It originated with James Nimon of Denison, Texas, and will be introduced by Prof. T. V. Munson, of the same place. It is one of the most promising sorts ever tried by the R. N.-Y.

AGAINST ARTIFICIAL COLORING OF BUTTER.

W. F. B., ANN ARBOR, MICHIGAN.—In the RURAL of May 4th the editor seems to favor the coloring of butter and he appears to think the subject hardly merits discussion. His comparison of the matter to the blacking of boots or the painting of houses seems to me to be quite defective. Good looks are always becoming, and perfectly proper when not obtained at too great a cost. There is no other way to make a boot respectable except by blacking, or to make a house so except by painting. But then we have to eat neither the polished boots nor the painted house nor the blacking nor the paint.

There is a much better way of making good-looking butter than by adding questionable ingredients to it and it is a much more profitable way. It is to put the color into the feed, by feeding sugar beets, carrots, parsnips or squash, notably the latter, with a ration of cornmeal and bran in addition to clover hay and corn fodder. By these means one can in winter make butter as sweet and attractive as in June.

People who color butter will can fruit with poisonous acids, and we can never tell what we are eating. Why not eat oleomargarine and be done with it if it tastes and looks like butter. But the most vital objection is a moral one. The act is a fraud, although in a small way; it may easily lead to greater ones. Who knows but some of the scores of bank cashiers who have skipped to Canada took their first lesson in dishonesty at their mothers' butter tubs?

CAN "NORTHERN-GROWN" SEEDS BE PROPERLY GROWN IN THE "MIDDLE STATES?"

"ANON," TERRE HAUTE, IND.—In the R. N.-Y., of May 25, a criticism is made on a statement made by the writer as to seedsmen selling for "Northern-grown seeds" those grown 200 miles farther south. The critic does not catch my idea exactly. A seedsman, we will say, in Minnesota, advertises his seeds, including corn, as the best, because northern-grown, which means with him grown in Minnesota. A farmer in the central part of Illinois or Indiana, thinking that seed corn from that latitude would be of benefit to him, orders some of it. But the corn had been bought in one of these lower States, possibly close by the residence of the one who orders. Is there anything wrong in that? It seems a very plain case—the farmer has been deceived. He may get good seed, but owing to the seedsman's profit and the double freight, it costs him four times what it would have cost at home. Admitting that northern-grown seeds are the best, there is a deception for probably half the seeds sold by seedsmen have been grown in a lower latitude, so that the advantage claimed by these northern seedsmen cannot be more than half true; half at least of their seeds being grown in the same latitude as those sold by all seedsmen in the Middle States and in a middle latitude. This is by far too great an allowance. At any rate if they advertise northern-grown seeds they should not sell as such those grown three or four degrees south of them.

TWO POULTRY PUZZLES.

S. C. M., WESTFIELD, N. J.—I set a hen on 13 eggs on April 3d. She was accidentally killed on the 8th, after having sat five days. I had doubts about the eggs hatching; but on the 11th after they had remained cold three days, I put them under another hen. Nine hatched—but, what do you think? Should they have "come off" 21 days from April 3d? You may think so, but they did not. They hatched out on April 27, instead of April 24. Does not this show that for 72 hours (April 8—11,) the life of those chicks was preserved without any growth? Odd, I think. I have a hen that will leave the nest while sitting only once in 48 hours, and invariably she hatches her eggs in 19 days. The ordinary hen that is off once or twice a day, sits for 20 or 21 days.

R. N.-Y.—This year we set a hen on Wyandotte eggs. She never seemed to act naturally, leaving her eggs frequently. They be-

came "stone-cold" several times. After about 10 days the hen was found dead on her nest—it is not known how long she had been dead when discovered. Another hen was placed on the eggs and four of them hatched, though two of the chicks were killed by the hen. Some good authorities state that a hen should not sit too steadily on her eggs, claiming that it is better for the eggs to "cool off" each day. The R. N.-Y. would like to hear from others on this point.

TO KNOW, BETTER THAN TO GUESS.

J. H. A., RANDOLPH, N. Y.—Every farmer knows that the profits are made up of little items coming from everything he husbands. Now, the one who farms well and knows just what he is doing allows no guess-work, and loses the least as a rule. I have been practicing this plan very closely of late in regard to the care of milk, though I was getting good results before, but I thought I might perhaps better them, and was surprised to find an increase of over one-eighth in the yield. Previous to the adoption of my present plan I set my milk as soon as I could milk two pailfuls and go to the milk-room and strain it, thinking there would be only a slight fall in the temperature; but when I tested it by means of the thermometer I found I was all wrong. Now each can of my milk is brought to a temperature of 100 or even 110°, and there is no guess-work. We can't afford to lose these little leakings. Only think of it—that little instrument, which costs but a trifle, may save a great deal for us. Who can afford to be without one in the milk-room? There are, no doubt, many who are doing the same as I did—going by guess-work—and what I have said may cause them to investigate and, as a consequence, largely increase their profits. I am fully confident that the more we know and the less we guess on our farms the better will be the results.

NEED OF MORE CO-OPERATION AMONG FARMERS.

C. F. O., DARIEN, CONNECTICUT.—As has often been said, "middlemen take all the profits." I see no reason why the day should not come when the farmers will buy and sell their own goods entirely. In some sections, this is largely the case now; but it is only because the farmers are united and work together. This is most noticeable in the co-operative creameries in New England. The farmers now manufacture their butter and fix a price on it, instead of, as before, taking it to the store and "trading it out," at the store-keeper's price. If the farmers can manufacture and sell butter in this way, why can't they grow and sell potatoes, and the other crops in the same way? I hope to see the day when our Western farmers will own their own mills, and make their own flour. Allowing these middlemen to "corner" our crops, and take our profits are things we will have to prevent, either by handling our own crops or by making our voice heard in the legislatures. This can only be done through co-operation. We have rights; why not stand up for them?

UTILIZING WIRE NETTING.

J. H. G., PEARSALLS, N. Y.—After completing my chicken yard, I had about 15 feet of wire netting left. It lay around the barn for a time, until finally I determined to put it to some use. So I put six old posts in the form of an octagon, and stretched the wire around them, putting a gate between two of them. I then moved a chicken coop, containing a hen with a brood of little chickens, into the inclosure. The next day I let the old hen out of the coop, and she has been as happy as a lark ever since. The little chickens occasionally climb through the meshes of the wire, but they never get far away from their pleasant home. I wish I had half a dozen of those little inclosures.

MORE ABOUT FEEDING ONIONS.

W. F. B., ANN ARBOR, MICHIGAN.—Two years ago I had a quantity of frozen onions. Not having disposed of all my stock before the frost came out, those on hand were not very salable, some of them being a little soft. I commenced feeding them to a couple of two-year-old heifers which were only in fair condition—just about holding their own on straw and corn-stalks. One of them ate the onions from the first, the other had to be educated for a few days. Both became fond of them, and though I fed only a small quantity at a time, I am sure the animals improved in condition.

L. C. M., WESTFIELD, N. J.—Just try toads as a remedy for Flea-beetles. They are worth paying 10 cents apiece for to be put in a garden or potato patch. "But they will hop away!" O, no; they like bugs too well, and they will find them in the best regulated gardens.

R. N.-Y. We have vines over 18 inches high that are covered with Flea-beetles. Will the toads jump up and eat them? Much has been said about the fondness toads have for potato bugs. The writer tried one the other day. The toad had fallen into an old drain where he had spent several days. It may be readily believed therefore that he must have been hungry. He was put in a tin can with three potato beetles. Twelve hours later the toad was found at the bottom of the can with two of the potato beetles perched on his back and the other by his side. Toads may eat the beetles—some of them at least may do so—but this particular toad surely proved a sad failure as an insect killer.

C. K., BELLEVILLE, N. J.—Can the RURAL assist me in the selection of a two-horse cultivator? I wish to obtain one which is easily handled, works with little waste of land in turning and can be adjusted for narrow or wide rows, and for deep or shallow (two inch) plowing. Are walking cultivators easier to handle than riding ones; (riding being no object) and are the former mostly tongueless? I have obtained circulars from different makers, but none gives the needed information.

H. A. M., GREENE, N. Y.—With regard to the size of clusters of various kinds of grapes, spoken of in a late RURAL, J. J. Thomas describes a cluster of Black Hamburgs that weighed 17 pounds.

What Others Say.

THE STRAWSONIZER. A distinguished party of agriculturists and representatives of the press recently visited the Queen of England's Farm, at Windsor, in order to witness a trial of Strawson's improved distributor, now styled the "Strawsonizer."

Our excellent contemporary, the Agricultural Gazette, says that the machines were ready for trial, one fitted for distributing liquids, and the other for solids. The same machine will do all kinds of work, and the only reason for using two was to save the time that would otherwise have been occupied in changing the fittings. The machine is a light one for one horse, being constructed in great part of wood, mounted on two iron wheels. The distributing power is obtained by a blast of air produced by a revolving fan, worked by the traveling wheels of the machine. As the material falls from the hopper, it is caught by a blast of air, and spread from the back of the machine. For solids a metal spreader is fixed, while liquids are sent through nozzles placed in different positions for various purposes.

Next, the other machine was set to work to sow barley, broadcast, at the rate of three bushels to the acre. The grain was distributed with wonderful regularity over a track 18 feet wide. A greater width could be covered, but the width named is considered most effective, and, as at this rate 30 to 40 acres can be got over in a day, the width is sufficient.

Another trial was an illustration of the sprinkling of a hop garden, special nozzles having been fixed for directing the liquid properly. In this case a dense and fine spray was sent out from the level of the ground up to a hight of about 20 feet on either side of the machine, and all present agreed that if the operation had been carried on between two rows of the tallest hops, the bine would infallibly have been sprinkled all over from top to bottom.

All the trials were deemed remarkably satisfactory, and it was the general opinion of those present that there is a great future in store for this wonderful invention. As a broad-cast sower for corn, seeds, manures, insecticides, sand (in the streets), or sanitary appliances, the Strawsonizer is certainly superior to any machine hitherto introduced.

Small hand-power machines are made for gardens, fruit plantations, coffee or tea plantations, and other purposes, as well as horse-power machines for farms. Special distributors are made for use in vineyards, for which purpose they are already in great demand. Indeed, the demand for the machine for all purposes, the Gazette says, is at present much greater than the supply. It would seem that this Strawsonizer is just what is needed, and sadly needed too, in this country.

RURAL LIFE NOTES.

LET US not forget the children's gardens at home, says the American Garden; neither must we forget that the children are of a younger growth than we. Their ambition exceeds their knowledge. Their efforts are persistent if not untiring. We cannot perform a giant's task, and should not expect a boy to do a man's work. Let us teach them to love garden work, and half of ours is done. Get tools light and adapted to their strength, and give them a little piece of ground where something will grow, and not insure discouragement by giving them some shaded corner or barren spot that a champion gardener could get no satisfaction from, as many guardians do, unless we wish to disgust them with gardens and plants and drive them to truer friends and better places than they find with us, and to seek pleasure in some other way. We must show them again and again the things they ought to know, and remember that example is the most potent factor in the education of a child. We must give them help to dig the stubborn soil, and tell them why some things are likely to flourish in this particular ground and others not. Advise them about getting their plants and seeds, which perhaps are more valued if of their own selection, and obtained with some effort on their part.....

MR. C. L. ALLEN says, in the above journal, that the gladiolus in our climate will not perfect itself in hot weather, and the only way to secure its full measure of beauty is to plant from the 1st to the 15th of July. Remember that, RURAL readers; Mr. Allen knows what he is talking about when he speaks of the gladiolus. We bought our first corms of him over 20 years ago. The writer well remembers that a set of 12 imported from France cost him $23, a rather large sum for a slender purse. But we enjoyed them more than the cost. Mr. Allen has done more to popularize the gladiolus and lily in this country than, we were about to say, all others put together—but we will say, more than any other person .....

PROFESSOR BUDD says that Acer ginnala is perfectly at home on the bleakest prairies of the Northwest. The objection to this tree in the R. G. is that it fruits too freely.....

PROFESSOR FERNALD states (see Transactions of the Massachusetts Horticultural Society, page 113) that Paris-green proves to be "a most effectual remedy for the rose beetle." We tried it thoroughly, as was thought, both on grape-vines and rose-bushes years ago to find that the rose-beetles did not seem to be hurt by it at all. He also recommends pyrethrum.....

THE MAINE FARMER some time ago put the searching question: "Can a ton of butter, of like quality, be produced at a less cost with a herd of Holsteins, than with the dairy stock we now have?".....

GOVERNOR HOARD wishes some of the 42 State experiment stations would make themselves useful in that direction.....

THE London Agricultural Gazette makes the gloomy remark that men who rely entirely upon farming as a means of maintaining and educating their families, are truly to be pitied.....

IT offers the soothing suggestion that it behooves young men who cherish a violent love for farming, and there are many such, to try if possible to combine their tastes for country life with some other more profitable occupation, and they may then enjoy their rural pleasures without fearing a monetary collapse.

DIRECT.

——W. F. BROWN in New York Tribune: "Don't go security."

——"EIGHT to 10 per cent. of corn-starch or arrow-root mixed with thoroughly dried table salt will, 'The Medical and Surgical Journal' says, prevent the packing of the latter in cruets, even in the most humid atmosphere (as on the sea coast), while a much smaller proportion is enough for inland points."

——AMERICAN GARDEN: "To teach love of plant life by text books, adding more to the already too long list for children, will, if practiced in our rural communities, be about as valuable as is usually the study of grammar. Some of the patient but erring teachers will learn their text books as they have their grammars; they can parse and analyze anything in the English language, but their letters are atrocious."

——NEW ENGLAND FARMER: "The Hale Brothers of South Glastonbury, Conn., expect to harvest this season the largest crop of peaches ever grown in New England upon any single farm. All their trees of bearing age give promise of a full crop."

——VERMONT WATCHMAN: "At the metropolis there is no agricultural journal to rival the long-established R. NEW-YORKER. It has the metropolitan spirit—a wide universality—but it never reflects the engrossing, selfish spirit of the great city. On the contrary, it is the strongest of all newspapers of any class in holding up every right and interest of the farm against every kind of corporate aggression, in the form of rings, trusts and all other aggressive monopolies. In the matter of illustrations it is easily at the head."

——N. Y. TIMES: "Farmers who use plaster on their corn or clover may be gratified, in either case, to know that this popular fertilizer is taxed at the rate of 50 per cent. on the cost of the unground material. We have bought the Nova Scotia plaster, which is a perfectly pure sulphate of lime, for $4 per ton at the port of importation, so that the import duty is 50 per cent. of the market value. No other country in the world is so well supplied with this mineral as the United States, vast beds of it being found in New York, Michigan, Illinois, Louisiana, West Virginia, Kansas, Nebraska, and some other States. Consequently this industry, considering the cost of freight, cannot fear injury from the competition of Nova Scotia and other parts of Canada. This tax is paid by the farmers beyond a doubt or question, and is a proof that, as with all other similar taxes, the farmer pays, out of his hardly earned income, a bonus to the gypsum quarriers for their personal benefit."

——N. Y. TRIBUNE: "The Rev. Wilbur F. Crafts mentions a prudent farmer, who, believing in having two strings to his bow, set up this garden sign: 'Boys, Don't Touch These Melons, for They are Green, and God Sees You.'"

"CHICAGO, May 31, '89.

——GENTLEMEN: Herewith we hand you our check in settlement of bill for advertising as per contract. It gives us pleasure to state that your paper has given us more business than all others we have used this spring combined; one feature that we did not expect was that it brought us orders from points near us.

THOMPSON & EDWARDS FERTILIZER CO."

——N. Y. HERALD: "Many men lead double lives, but reference to only one of them is made on their tombstones."

Horsford's Acid Phosphate.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

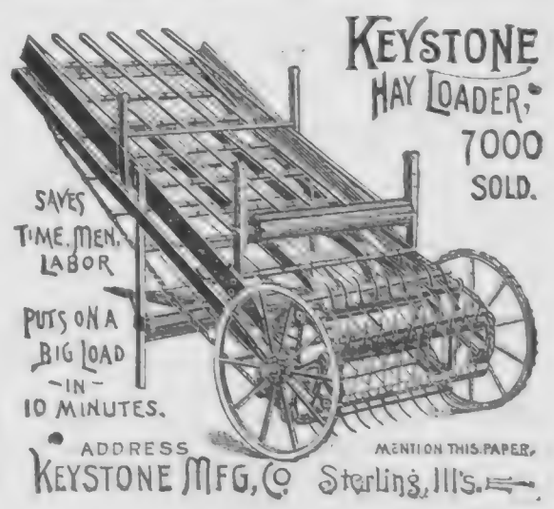
100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lame-back, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

BEECHAM'S PILLS cure bilious and nervous ills.



THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JUNE 22, 1889.

THE gales and heavy rains of last week have blown away or destroyed so many of the Flea beetles that the vines of the "Contest" plot are having a little rest and, in consequence, show a decided improvement in color and vigor. Two weeks ago we were sure of another failure. Now we have a hope (not a very confident one) of success.

THE "three-barrel" potato experiment of the R. N.-Y. is progressing nicely. The stems have grown through from 15 to 16 inches of soil, and the vines are now 18 inches above the tops of the barrels, looking the picture of health. A platform has been made about the barrels level with the tops for the support of the vines when they shall fall over. This is to the R. N.-Y. a very *interesting* experiment, though nothing of any account may come from it.

NEXT week the R. N.-Y. will begin the publication of a reply to Professor Porter's recent attack upon the agricultural colleges. It is written by President W. I. Chamberlain, of the Iowa College. Speaking of Professor Porter's article, President Chamberlain says:

"It virtually charged failure because the agricultural colleges have not done as much in 20 years as the old colleges did in centuries. I claim great success, considering all the facts and circumstances."

"THE rose for the million" is what we hope one, if not two, of the R. N.-Y.'s Rosa rugosa hybrids will prove to be. We were told by several good friends four years ago that nothing would come of the cross. "It will be interesting, no doubt," they said, "but you will not get anything of value to rose growers."

"Why did we choose Rugosa crosses?" There were several reasons, the most forcible of which was that the field was a new one. And it is still new. It is by no means improbable that we shall have in and from these crosses new races of roses as valuable and as distinct as any others. Mr. John Thorpe, well known as being one of our first rose authorities, during a short visit to the Rural Grounds a few days ago, was emphatic in his praise. "It is a great acquisition," said he.

"WILL you tell me," said the writer of this note to Mr. John Thorpe, during a brief visit to the Rural Grounds, "why those half-a-dozen tall, vigorous rose bushes do not bloom? I have asked the question of several others, and I was answered that they were not properly pruned."

"Why," replied Mr. Thorpe, after a brief examination, "they are Manetti roses." We had never suspected it, not being familiar with this rose, which is used chiefly for stocks upon which to bud other roses either of feeble constitution upon their own roots, or those that will not readily root from cuttings. This Manetti is a very shy bloomer. It always has as many as seven leaflets—rarely nine. It may be known by this characteristic. Have you any roses in your collection, readers, that do not bloom? Perhaps in your case, as in ours, the varieties budded upon them have been winter killed and the Manetties, which are great roses to sucker, have grown up in their stead.

VERMONT should enforce more fairly the prohibitory liquor code she has passed. The fact that the number of United States licenses to liquor sellers amounts to 450—more than one for every town and village in the State—demonstrates that a great deal of intoxicants is sold there in spite of the law. Cider used to be one of the staple products of the Green Mountain farms; but the law with regard to its sale is stringent and pretty rigidly enforced. The penalty for the first offence in selling it is $10, but for a second conviction the figure is raised to $20; while persistent violations of the law are punishable by fines varying from $1,000 to $3,000, with varying terms of imprisonment, at the discretion of the court. While the sale of intoxicants in towns can be carried on without much difficulty, the sale of cider by the barrel on the farm is not so easily concealed, especially as a share of the fine goes to sharpen the wits of the informer. Let the sale of cider be prohibited by all means; but the law against other intoxicants should also be sternly enforced.

DURING the past week the R. N.-Y. has examined a good many acres of potatoes in different parts of New Jersey. The crop is generally looking fairly well, though the heavy rains about planting time caused some rotting of seed, particularly on low land. But the beetles! They are without number. It is pleasant to know, (see Mr. Gillette's article on page 413,) that they are disappearing in Iowa, but the serious fact remains that they like New Jersey too well to leave. They are a terrible pest. We noticed that more farmers than ever before are using the water and Paris-green mixture this year. Some of them use the plaster mixture when the vines are small, and the water at the second and later applications. We met one farmer who has already made six applications of poison, and the beetles are "still with him." The frequent showers that we have been favored with this year have greatly increased the labor of applying poisons. The larger growers are all using sprinklers. Without question the tendency of potato growing is towards large areas where the improved machinery for planting and harvesting the crop can be employed. Another evident tendency is to make the potato crop the point in the farm rotation for applying the bulk of the fertilizers.

THE DOUBLE WHITE HORSE-CHESTNUT.

IT is a matter of surprise to the R. N.-Y. that so little is said, so little known, of the beauty of the Double White-flowering horse-chestnut. As an ornamental tree it ought invariably to take the place of the old single white (Æsculus hippocastanum) because it is more pyramidal in form; because the racemes of flowers are larger and, last though really first in importance, as the tree bears no fruit, it is free of the serious objection to the common variety that the lawn, during the late season, is littered with the nuts and their shells. The flowers of the Common White have but five petals; those of the Double White have upwards of 30. Each petal is splashed with crimson at the base and the whole raceme reminds one, at a little distance, of a compact spike of hyacinths. This tree was sent to us some five years ago by Ellwanger & Barry. It is now about 12 feet high and is blooming for the second year. Ellwanger & Barry have a specimen over 40 feet high, which Wm. Scott, in his "Suburban Home Grounds," describes as "in the blossoming season, like a verdant tower, spangled all over with hyacinth bouquets."

A CAUTION.

TO a half-barrel of unleached ashes were added a quarter of a barrel of "Peroxide of Silicate," and a quarter of plaster which had been poisoned with the usual quantity of Paris-green, viz., 1½ pound to the barrel—making a barrel in all. This was sifted on the vines of a small plot of potatoes in order to find out what effect it would have either in killing or repelling the Flea beetle. It was assumed that the poison of the quarter-barrel of the "Peroxide" and plaster would suffice when thoroughly mixed with the half barrel of unleached ashes to kill the potato-beetle. The result of this application upon the vines was to seriously injure all the leaves and to destroy most of them. As it had been previously ascertained that the ashes and poisoned plaster, mixed together, half and half, did not notably injure the leaves, the damage was attributed to the "Peroxide."

A barrel of the Peroxide was sent to the Rural Grounds last year for trial, and we were instructed to use it without dilution. The result was that it killed all the leaves upon which it was sifted, as our readers were at the time advised. This insecticide (Peroxide of Silicate) is now advertised in many papers. If it is now made the same as it was then, our readers are cautioned against its use without first testing it on a few plants.

ANOTHER POTATO PEST.

LAST year we found stems of potatoes, here and there, fallen over and either dead, wilted or wilting. Examination showed that in some cases the stem was rotten about an inch under the surface of the soil, while in others it seemed to have been eaten into as if by a borer of some description. This year so many of these wilted or dead vines were noticed that a more careful investigation was made. The result was that the wireworm or thousand-leg worms (Julus or Iulus), was found to be the apparent cause. In some instances the vine was girdled; in others from one to four of these millipedes were found eating into the stems; in others they had bored into and up the stem. The vines at length rot about the infested part, or become so weakened that they fall over and die. The vines are attacked always just beneath the soil, or from one inch to 1½ inch underneath.

We now learn that potato vines in certain parts of Monmouth County, New Jersey, are similarly attacked. The growers attribute it to blight or something caused by damp weather. In some sections the damage is said to be serious. We advise the use of powdered sulphur blown or sprinkled about the stems.

PROFITS OF TRUSTS.

IT is a very difficult matter to learn the profits made by any of the "trusts." All the public knows is that men connected with them have become enormously rich, and that trusts have gone on multiplying until they have become a power so all-pervading in nearly every enterprise and industry in the country, that its extent can hardly be estimated. The parent of trusts—the Standard Oil Company—took the position that it was a purely private affair, and all the other trusts have followed the example of secrecy it has set them. Particularly is this the case with the sugar trust; but some figures have lately been published here, which show that its profits must be so enormous as to make even Standard Oil men green with envy. Its nomial capital is $50,000,000, and on this amount dividends are paid; but it is claimed that the actual investment is only $15,000,000, the other $35,000,000 being "water." During the past week its certificates have gone up from 99 to 107, with large sales and increasing demand. Refined sugar was put up a quarter of a cent per pound, or $5,000,000 on the yearly consumption, and as the trust refines 75 per cent. of the whole output, its shares of this little increase alone must amount to $3,750,000 a year. In 1888 its profits, as shown by elaborate statistics, could not have been less than $14,000,000, and doubtless they were much greater. For the first five months of this year the same line of calculation shows that its profits must have reached $8,230,000 at the lowest estimate. The price of refined sugar has risen continuously ever since the trust was formed. Statisticians say this is due chiefly to short crops in the cane and beet-sugar producing countries; but there is no doubt that this insatiable combination has had much to do with a steady rise which has put so many millions into its own coffers. The New York Courts have already decided that the association is an illegal body; what are the oppressed people going to do about it?

THE CASH CROP.

WHAT is your money crop? You will doubtless ask yourself this question after reading this issue of the R. N.-Y. This is a business number. There are two points upon which all our correspondents seem agreed

1. The agriculture of most sections is constantly changing. The extension of the railroad system may revolutionize transportation facilities so completely that the producing of a staple article may be changed from profit to loss. This is because the article can be brought to the market from more distant lands that are so situated that the article can be more cheaply produced. The section that is outbid in price, must produce a better article that will command a higher price, or go into some new line of work. A study of the answers found in this issue will reveal dozens of such changes; from dairying to maple sugar, from hay to potatoes, from grain to cheese-making and so on. The point we wish to emphasize is that conditions are changing so rapidly in this country that it is the farmer who has his farm in such a shape that he can readily take advantage of reliable indications of change, who alone can hope to keep ahead of his business

2. There is an evident and growing demand among farmers for a thorough organization that shall direct education in the right lines, encourage the study of sound, political economy, and take hold of the business situation in a vigorous and clear-headed manner. This organization must command respect and demand for farmers a fair and honest share of the country's profits, striking straight at whatever stands in the way, whether it be the prejudices of the farmers themselves or the rapacious greed of speculators or monopolists. The R. N.-Y. believes that thousands of good, thinking farmers all over the country are satisfied as to the need of such an organization as we have indicated. When shall we have it? How shall it be started? These are vital questions.

And while on this subject the R. N.-Y. is led to refer to a farming community it has just visited. This community is in New Jersey, within 50 miles of New York. "The cheap lands of the West will so flood Eastern markets with staple products that New Jersey farmers will have to become gardeners or truckers! Farming cannot be done without the use of stable manure as a basis; chemical fertilizers will 'burn up' the soil!" At certain seasons of the year we hear these statements repeated over and over again. How ridiculous they appear after a visit to the community we speak of. Here we have a class of farmers growing rich at producing hay, potatoes, corn and wheat. Yes, actually growing rich at producing Western products within 50 miles of New York. And it is done practically *without* stable manure; a farm having less than 10 head of cattle sells from $1,000 to $1,200 worth of hay and absolutely grows stronger and more productive each year. Under such a system of agriculture the boys stay at home, farm life is robbed of its worst features and becomes a very ideal life of comfort and happiness. We saw this life realized—saw the crops, the tools, the men. We were so interested in it that we propose to tell R. N.-Y. readers just what we saw. We hope our report will lead to some hard thinking. It will be nothing but a report as honestly written as possible.

BREVITIES.

WE shall be glad to have our readers answer the question asked by C. K. on page 415.

MR RICE'S remarks, on page 414, are well deserving of attention. Mr. Rice, by the way, "makes farming pay."

A NEIGHBOR had a piece of potatoes that were very uneven as a result of too much water. He has just been transplanting some of them to get them all in a bunch. Will it pay?

MARKET gardeners in the vicinity of New York are cutting early cabbage. Strawberries are not so plentiful, and are higher in price than they were two weeks ago. Cherries, peaches, plums and gooseberries are quite plenty at reasonable prices.

ORATORS, poets and philosophers are fond of saying that railroads are vast blessings and wonderful civilizers. On page 410 a Kansas subscriber shows that he would have been far better off if the railroad had kept away. Thus we see that there are many ways of looking at every subject.

Mr. William Falconer writes us as follows: "STYRAX JAPONICA is now in full bloom, and the most beautiful shrub in our place today, the fragrant waxy-white snowdrops hang in thousands all over the little trees and bend the slender branches right straight down. And among herbaceous plants our Canterbury Bells are supreme, surpassing pæonias, poppies, coreopsis and larkspurs—thrifty, branchy, one mass of clean, clear, showy flowers, which are highly serviceable as garden ornaments and for cut flower purposes when they last a long time. Now is the time to sow for next year's crop of flowers. The chief trouble with growing Canterbury Bells is that they are barely hardy in winter, but the protection of a cold-frame is all they need and all I give them."

FARMERS often put on wry faces when, in a few hours after Paris-green has been applied, a rain washes it off. They should bear in mind that the grubs eat constantly and that if the poisoned water or plaster has been thoroughly applied, every grub then upon the vines will be killed. The only objection to a rain is that the new grubs from the eggs not hatched out when the poison was applied will need another dose. The R. N.-Y. thinks that many farmers use too much poisoned plaster on their vines. The thinnest dusting suffices as well as a dense coating which is certain to injure the foliage more or less. In fact, plaster alone or ashes or flour or any other substance, however innocent in itself, which covers the leaves, impairs the leaf function to the injury of the plant.

Field Crops.

WHEAT NOTES.

DO YOU SOW A RED OR A WHITE WHEAT? WHY?

ANSWERS.

FROM IRVING D. COOK.

Nearly every year since the weevil ravaged the wheat fields of Western New York, I have grown almost exclusively some of the red varieties of winter wheat. Although larger yields of the Clawson (the favorite white variety) are sometimes grown, I am convinced that for our average yield, one year with another, the red varieties on my farm are the most profitable, for the following reasons: They are less liable to be winter-killed; they weigh more pounds to the bushel, and they usually command a higher price for flouring purposes. A promising new variety called the Yates County Amber, is just being introduced among the farmers of Genesee county, yielding the last season, in nearly every instance, 30 or more bushels per acre.

Genesee County, N. Y.

FROM PROFESSOR SAMUEL JOHNSON.

We sow both red and white wheats. As a rule, red wheats are hardier, less susceptible to injury from insect enemies, and thus more likely to give a fair return on lands somewhat worn. The price of red wheat is frequently more than that of white. When this is true, it would be a reason for sowing the former. Red wheat can usually be sown earlier than white. On good, fertile wheat land I would ordinarily sow white wheat, in this latitude, from Sept. 10 to 20th. For earlier or later sowing I would prefer red.

Michigan Agricultural College.

FROM HERBERT ROOT.

Here in North Dakota we sow only amber-colored hard Spring wheat, because, 1, it makes the best flour in the world; 2, we can grow it, and but few others can; 3, it brings the highest price; 4, it out-yields all other wheat with us.

Valley City, North Dakota.

FROM O. C. HOWE.

I sow both white and red wheat upon my farm. I sow white wheat upon stubble ground because I think it less liable to be hurt by the fly. In the main, red is best, because the price does not fluctuate, as has been the case with that for white wheat. Formerly when white wheat was generally raised, the buyers did not want it; and now that but little is raised the price is two cents above that for No. 2 red.

Berrien County, Michigan.

FROM S. B. HOEFGEN.

We sow red wheat almost exclusively, because the red varieties are generally considered more hardy and reliable. The buyers formerly paid more for white than for red wheat; but now no difference is made in the price, and that perhaps has had something to do with the great decrease in the area of white wheat.

Crawfordsville, Ind.

FROM PROF. A. J. COOK.

I sow white wheat. As the years go by there is no essential difference in the price. Sometimes the white wheat sells for more than the red sorts; then again the red kinds fetch most. In my neighborhood the Clawson has done better than any other wheat ever brought in the country. Hence I sow Clawson.

Shiawassee County, Michigan.

FROM H. COX.

I sow red wheat, because the first consideration in a wheat is earliness, then come stiffness of straw to make it stand well, and productiveness. Millers seem to prefer it for the new process of flour making. We find the above qualities in our best red wheats.

Kalamazoo County, Michigan.

FROM J. C. STRIBLING.

I sow a small-grained, round, plump winter wheat. It is the earliest and hardiest, consequently it is less liable to rust, while it weighs more and gives more good flour per bushel than the white varieties. Some years whites do better, but my 30 years' experience with different varieties convinces me that wheat of the red sort described is the most profitable and reliable here for a term of years.

Anderson County, S. C.

FROM JONATHAN TALCOTT.

I sow a white wheat without beards, because I like the product better than that of a red wheat. I like a white-wheat bran far better for feed than a red-wheat bran, and the women of the house like the flour better.

Rome, N. Y.

FROM A. L. CROSBY.

I sow a red wheat (Fultz) because it stands up better, is hardier, yields better, sells better, cures better, and is better in every way than any white wheat I know of.

Catonsville, Md.

FROM O. T. BATTLES.

But little wheat is raised in this county. Red wheat is grown here principally. I have sown Fultz wheat for about seven years and think it superior to any of the new kinds, it being hardier and not so liable to winter-kill, and also being a good yielder. The county mills consider it equal to white, at least the roller mills will give as much flour in exchange, and when it is sold in the Cleveland market the difference in price is but one cent per bushel. Wheat in this vicinity will not be over half a crop, but on higher lands farther back the prospects are good for a full crop.

South Euclid.

Arboricultural.

THE OLEASTER AND PEA-TREE FAMILIES.

PROFESSOR J. L. BUDD.

THE OLEASTER FAMILY.

In nearly all parts of our country the silvery-leaved shrubs and trees have their uses for certain positions on the lawn, and among those really hardy at the West, and in the "Cold North," the oleasters, and some of their near relatives, take the lead in beauty of foliage and rare fragrance of flowers. With my office perfumed with a vase of the blossoms the idea occurs that a few notes on the best species may encourage their propagation and dissemination.

ELEAGNUS ANGUSTIFOLIA.—The East European form of this is hardy everywhere in the Northwest. It is an erect grower and attains a hight of 30 feet or more, with a fine spread of top. The few larger specimens we have in Iowa have proven objects of interest in winter and summer, as not only the leaves and fruits are silvery, but the buds and young branches as well. The flowers of the Eastern form are perfect, and more fragrant than those of Eleag nus hortensis, and the fruit has no show of the red spoken of by Loudon and Hemsley.

ELEAGNUS ARGENTEA.—Although native to the banks of the Upper Missouri, this fine shrub is rarely seen in the West. Although it is difficult to excel it on the score of beauty and oddity of foliage, its habit of sprouting is against it as a shrub. Hence it should be propagated by budding or grafting on E. angustifolia. In Europe I saw many specimens of it growing in this way. Worked at a hight of four to five feet, it forms a handsome rounded head that can be seen from afar.

ELEAGNUS MACROPHYLLA.—This is a shrubby oriental species with glistening silver foliage. Its fruit is also said to be more nearly edible than that of the other temperate-zone species. It is a sprouter and will give the best satisfaction when top-worked.

ELEAGNUS LONGIPES is not really hardy here. It is killed back more or less each winter, yet the lower limbs are always full of the peculiar fruit.

HIPPOPHÆ SIBIRICA.—The Sea Buckthorn of West Europe fails to endure our summers or winters; but that of Southwest Siberia is all right up to the 43d parallel in Iowa. It makes a very handsome silvery-leaved shrub very little given to sprouting. It may also unite with the Angustifolia in top-working as it is a near relative.

SHEPHERDIA ARGENTEA.—This is known as "Buffalo Berry" on the Upper Missouri, where the banks are covered with the pretty combination of the silvery leaves with the loads of red berries in late summer and early autumn. As it is strictly dicœcious, and the fruit is a leading essential in the beauty of the large shrubs, for ornamental planting it should be planted in clumps of three or four. In certain positions on the lawn such a clump is very attractive.

THE PEA-TREE FAMILY.

The larger form of the caragana (Caragana Arborescens) has proven useful for screens, and as an ornamental tree of small size north of the 43d parallel at the West; but farther south its beauty of foliage is impaired by the summer heat. Some of the more beautiful dwarf species are, however, from the hotter and drier portions of East Europe and North-central Asia, and they will endure great summer heat and aridity of air, as well as the lowest winter temperatures. As the best of them are given to sprouting, they should be worked by budding or grafting on stocks of C. arborescens. With a view to encouraging their propagation in this way East and West, I will note three or four of the species now loaded with the rich, deep golden clusters of blossoms, to be followed soon by the peculiar little colored pods.

C. GRANDIFLORA.—Some specimens top-worked four years ago on the Arborescens, have attracted more attention than any trees on the grounds. Each forms a beautifully rounded, pendent head, and the large, bright yellow, pea-shaped flowers form a handsome contrast with the lighter green, acacia-like foliage.

C. REDOWSKII.—This forms a contrast to the above, as the foliage is different in shade and the leaves have but two pairs of ovate, smooth leaflets. It is a very profuse bloomer.

C. SPINOSA.—This is another varied form with singular spiny branches. Its clusters of bright yellow flowers, and its after crop of peculiar pods have a singular appearance among the thorns and handsome little leaflets.

C. FRUTICOSA.—This is prized as a shrub in East Europe, and is now warmly praised by some of our Eastern growers. But it will be prized still more when it is headed four feet from the ground on the Arborescens. The four named above are perhaps as desirable as any for top-working, yet those who wish varied shades of foliage, habit of growth, and shape, size, and season of flower, will equally prize C. microphylla, C. arenaria, C. pygmæ, C. frutescens, and C. Chamlagu. While it is true that these dwarf caraganas will prove most valuable where the shrub and ornamental tree test is restricted by trying climate, yet their peculiar foliage and flowers will give some of them a place over a large part of our country.

Ames, Iowa.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

A BIT OF NATURE.

THE most charming of all gardens are those which give the impression of a "naturall wildernesse," to use Lord Bacon's words—where Art is subservient to Nature, and indeed the art itself is Nature. A wild garden, where both native and foreign hardy plants are allowed to grow at their own sweet will, with just enough training to render them effective, compared with formal bedding-out, is as a sonsie country maid compared with Miss Flora MacFlimsey. It is a sign that good taste is on the increase nowadays that such graceful, natural arrangement is superseding the old-time horrors of carpet-bedding.

One of the prettiest natural gardens the writer recollects consisted of a little nook surrounding a tiny pond. It was an irregular bit of water, with

> "Many a fairy foreland, set
> With willow, weed and mallow."

The pond itself was filled with water-lilies and duckweed, the latter being present without leave. Duckweed can only be compared with the obtrusive "pusley" described in "My Summer in a Garden;" it takes up its quarters without any invitation whatever, and makes itself so much at home that the gentle water-lilies positively feel as if they were intruding. It can only be endured, like chilblains; though it may be kept in check to some extent, there is no cure, when it once gains a foothold—except filling up the pond. But this is a digression.

All around the edge of this pond aquatic and semi-aquatic plants were arranged—the blue Pontederia, frail-looking Arrow-head, Golden Club, with its orange spike, and tufts of rushes. Beyond this was a wide border, backed by a natural bank overgrown with pink bindweed and wild clematis. This border was filled with a little of everything. The soil was rich peat and leaf-mold, which formed excellent nutriment for great clumps of native ferns. Mingled with the ferns were native orchids, Lady's Slippers, Snakemouth, Ladies' Traces, and Preacher-in-the-pulpit. The gorgeous foliage of caladiums rivaled the orchid blooms with their glowing colors, and everything looked, not as if it had been planted, but as if it just grew there. This sounds a very simple bit of a garden, and so it was; but it was most charming—a bit of ideal horticulture.

One may arrange a garden of this style entirely with native plants; though in such a case some unappreciative Goth is pretty sure to vex the soul of the gardener by dubbing them "weeds." When it can be arranged, a rock border is charming, only don't build one of those mausoleum-cairns of stones, with here a plant and there a plant, sticking up among the rocks, the whole being described by many misguided people as a "rockery." Such arrangements are often built merely as an irregular pile of stones, with a top-dressing of soil put on with the last layer. And then people wonder why their plants don't grow! If you examine rock-growing plants in their native habitat, you usually find that the fissures in which they grow widen as they descend, and consequently the plants have an unfailing supply of moisture and nourishment at the root. Reverse this, put a plant in a shallow fissure which soon diminishes to nothing, and it is not strange that it "dwindles, peaks, and pines." This is the usual rockery, and very melancholy is its general effect. It is so often inappropriately planted, too—fancy red geraniums growing on a pile of rocks, and yet we often see this favorite plant so misused. First and foremost, a rockery or informal border should give the idea of permanence, and for this reason hardy herbaceous plants should be chosen.

"There's fennel for you, and columbines," and the latter is one of the showiest plants for a rock border. There is the wild columbine, miscalled honeysuckle, with its gay red and yellow flowers, livening the rugged Palisades; there is the more dainty Rocky Mountain columbine, blue and white, and the lovely golden columbine from Arizona—all hardy, and all native Americans. Then for early spring there is

> "The coy anemone, that ne'er uncloses,
> Her lips until they're blown on by the wind."

Most of the anemones are of mountain birth, and they all find a congenial home among the rocks. The scarlet Anemone fulgens is the most gorgeous flower of early spring, while the bright yellow Ranunculus-flowered anemone forms a glorious contrast. Then there is the pale purple or blue Pasque Flower, which brightens the plains of the Northwest; all form desirable tenants for a semi-wild border.

The bonnie Blue Bells are charming enough to find a place in every garden, and most of them are admirable in a rockery. They are real mountain-dwellers for the most part; they cover the slopes of the Carpathians, and lift up their innocent faces by snowy slopes of Mt. Cenis.

Assuredly one may arrange a hardy garden permanently with an overflowing measure of success, as far as beauty goes, and with little trouble and less expense. The arrangement must never be formal or stiff; natural unstudied grace

> "Doth more bewitch me than when art
> Is too precise in every part."

It may be a home of grandmother's flowers—perennial phloxes, Sweet Williams, yellow Day lilies and Love-in-a-mist, Corn-flowers and pinks, and Love-lies-bleeding, tangles of hardy roses and clumps of Flower de Luce. I think Lord Bacon's idea for a wild garden could not be improved upon. He says: "*Trees* I would have none in it, but some *Thickets*, made only of *Sweet Briar* and *Honney-suckle*, and some *Wilde Vine* amongst; and the ground set with *Violets*, *Strawberries*, and *Prime-Roses*. For these are sweet, and prosper in the shade. And these to be in the *Heath*, and here and there—not in any order. I like also little *Heaps* in the *Nature* of Mole-hils, (such as are in *Wilde Heaths*) to be set, some with Wilde Thyme, some with Pincks; some with Germander, that gives a good flower to the eye; some with Periwinckle; some with Violets; some with Strawberries; some with Cowslips; some with Daisies; some with Red Roses; some with Lillium convallium; some with Sweet Williams Red; some with Beare's Foot, and the like Low Flowers, being withal, sweet and comely."

This is the very ideal of a natural garden. Who, after reading it, could call Bacon a dry and musty old philosopher? It is a model one should bear in mind when establishing a hardy border—a veritable joy forever to all flower-loving women.

OUTINGS IN NEW ENGLAND.

NO. X.

MARY WAGER-FISHER.

WE consumed a full half of our second New England outing time in prolonged stops on our way to the Massachusetts

sea coast. We first went due north from Philadelphia to Oswego, on the New York side of Lake Ontario, where we tarried for more than a month, and consumed a full week in journeying from there to Boston.

The lake breezes render Oswego an agreeable city for a summer sojourn, and the little city has quite an extended reputation for its beauty The streets are beautifully shaded, and I do not remember to have been in another town in which horse-chestnut trees so abound, nor where landscapes are painted on the wall back of the pulpit in churches—not a bad idea, however, particularly when the picture is better than the parson.

The native elms of Northern New York are of great beauty and add a large element of picturesqueness to the landscape, and in varied scenery New York is peculiarly rich—mountains, rivers, lakes, forests—a world of beauty in itself. A friend, who has traveled much, and who knows a great many people, always says, when speaking of New York State people: "They are the *best* in the world—the warmest-hearted, the most hospitable." Being a New Yorker myself, of course, I always coincide with these views, while Anaximander looks grim in behalf of his beloved Keystone State. Provincialisms are not so marked in the different States in this country, perhaps, as in the different counties in England. Still they do exist to a certain extent. A young man born and bred on the Pacific coast, who lately came to study medicine in Philadelphia, told me that the way in which Philadelphians emphasize words in a sentence struck him as very funny. Instead of saying "Are you going *out?*" the question would be "*Are* you *going* out?" A woman from Maine says that she never becomes accustomed to the Philadelphians' habit of speaking of having lost a friend, when the friend has died. New Yorkers use "want" for "wish," and a noticeable provincialism is the use of "boughten" to designate an article bought at a shop instead of one home-made.

One of the entertainments of Oswego, of which Anaximander and the laddie availed themselves, was a summer school of languages, which brought together several hundred young people for vacation study. The natural method of teaching was employed, and in the various class-rooms rarely a word was heard, except in the language being taught. Of course, by being obliged to hear and speak only the language studied, an apt pupil would soon acquire considerable facility in its use, and the confusion arising from different tongues to be heard was quite amusing. One of the young men in the school was an Armenian who had been born and reared in the immediate neighborhood of Mount Ararat, and after having studied English for a few months he felt competent to lecture. But his English was a curious conglomerate, and his Armenian dress and his nativity smacking so strongly of Noah's Ark, constituted his only claims to attention. In no one way is the good nature of Americans more manifest than in their treatment of adventurers, who *talk* for a livelihood, and have nothing of value to say.

There are a number of very beautiful homes in Oswego, but the most noted for its almost priceless treasures is that of Mr. Irwin, a handsome, healthy-looking man, who grew up in the country near Oswego, later on engaged in the buying of grain and accumulated a large fortune, and who has spent it most liberally in buying, from time to time, exceedingly rare and beautiful things—pictures, bric-a-brac, and particularly books. He owns one of four books in existence, and one of the first 11 books—Bibles—printed in Latin by Gutenberg, who used movable types and was five years in printing them. A few pages were printed, when the types were reset for succeeding pages. This one Bible is valued at $20,000. When Mr. Irwin secured it in Europe, it was in pig-skin binding. It has been elaborately rebound at a cost of over $400. Many of the valuable books are kept in a fire-proof safe, and are more precious than gold: among them are a number of exquisitely illuminated missals of the 13th and 14th centuries. A small print about as large as a silver dollar, after a picture by Albert Dürer—the "father of German art," and who is said to have invented etching—cost nearly 500 dollars. A copy of the Bible, in some 60 volumes and weighing a ton or more, contains prints of every picture of value or interest extant illustrating Biblical subjects. In the drawing-room is a table once owned by Marie Antoinette, of France. It is inlaid with painted medallions in Sèvres china and is of great beauty and value. The great charm of the Irwin house is the exquisite harmony, to the minutest detail, in the furnishing, and its extreme homelikeness. Although every article of furniture is as beautiful as money could well buy, everything seems to be perfectly at home and used to being enjoyed by home-loving occupants. This is but one instance out of many in this land of self-made men, of little centers of art of surprising excellence being established in the most unexpected places. One cannot but wonder how a country lad grown into a busy manhood could have time to form so fine a taste in the fine arts.

One of the industries of Oswego is the manufacture of starch by Mr. Kingsford. The starch is made of Western corn, which is ground wet, and goes into immense wooden tubs or vats, 10 feet in diameter and greater in hight. The chemicals put in the water in the vats have an odor like lye, and the smell from the starch factory is very unpleasant. After a time the water is drawn from the vats, and the contents left therein are drained in square troughs lined with white muslin. This is now practically starch, and is broken up, moved into another apartment where it is wrapped in blue papers and put in the drying room. When it is dry, a brown crust which has formed on it has to be scraped off, and this refuse is worked over into a lower grade of starch. About six weeks are required for the entire process. Mr. Kingsford is of English birth, but came with his father to this country, where they worked in a starch factory in Jersey City. The starch was made of wheat, which was dear, and its cost led to experiments in the use of corn, all of which failed. But out of one failure grew success. Some discarded buckets of the corn in the process of experiment, having been set out-of-doors over-night, the contents were found next morning to have changed into starch. Thirty-five tons of starch a day are turned out at this factory, and to accomplish this, much ingenious machinery is used and many men and women are employed. The wooden boxes which hold about six pounds of starch and have a sliding top, cost about 20 cents The machine which does the dove tailing of these boxes was invented by F. I. Gleason, and I was told that he was too poor to patent it and other men had utilized his invention. The refuse of the factory is bought by the farmers in the neighborhood of Oswego for hog feed, and they pay for it about 15 cents per barrel. One woman whose business it was to paste a colored picture on the top of boxes was so quick that she pasted on 2,500 a day. The women employed were paid half a dollar a day and the men double that and more. There had never been any "strikes"

SOME DEFINITIONS OF "CULTURE."

OLIVE E. DANA.

WOULD it not be well for the many young "RURAL" readers, who long to make the best of themselves, intellectually and otherwise, to define to themselves clearly the "culture" or education or self-discipline for which they long? And would it not help them to such definition to read first what some wise men and women of our own day have said concerning this subject? One or two such utterances, thoughtfully pondered, might give new direction and impetus, new and more intelligent hopefulness to the seeker after wisdom.

A book called "The Philips-Exeter Lectures, 1885-86," contains as its opening chapter, an address by Edward Everett Hale. Its rather uninviting title, "Physical, Mental and Spiritual Exercises," conveys little idea of the scope and value of the paper to every student. One who wishes first of all to get a true notion of what education is—and this would seem to lie at the very foundation of attainment—should read this discourse of Mr. Hale. It may save him from many a failure, mistake, or discouragement. It is the wrong track that leads to disheartenment; it is better to take care of the beginnings, and start right. The lecture to which I refer is brief, and enters little into the details of study; yet it presents some very practical suggestions. And while our young student has the book in hand it may help him or *her*, (for why shouldn't girls build as wisely and broadly as their brothers, in their own way?) to read some at least of the following chapters. Any young person, ambitious of attainment, can hardly fail to be influenced, impressed and inspired by the closing lecture of the volume, that of that always noble and inspiring preacher, Philips Brooks on "Biography."

Then there is a book called "Hints on Self-Culture," by John Stuart Blakie, a Scotch scholar, professor and author, who died not long ago. It was published a few years ago in Funk & Wagnall's "Standard Series," in which form I secured it for the sum of 10 cents. But its manilla covers have guarded it well, and its counsels are as trenchant and trusty as ever. Its style is admirably clear and interesting, and its substance sound and impartial. Matthew's "Getting on in the World," is well-known and weighty in its accumulation of fact, anecdote and allusion. I know of no book so full of what may be called practical illustrations of success and its conditions, including, of course, culture and self-discipline as both preliminary and crown of "success."

Hamerton's "Intellectual Life" is full of good things. It has become almost a classic. To have read it understandingly and sympathetically is to have taken one sure step toward true intellectual discipline. For girls especially, Miss Livermore's "What Shall We Do with Our Daughters?" may be mentioned. And Miss Willard's "How to Win" is wise, witty and brilliant. It is so largely written out of her own life that it has added value and significance. And its racy chapters abound in practical wisdom and words of encouragement. Of course, it is not expected or desired that the boy or girl who cherishes "ambitions in homespun," and longs to find the way to knowledge, will read all these books. But one or two of them may be within reach, and may foster intelligent aims, open near, judicious and accessible ways of attainment, and give hope and courage to persevere therein.

The book first named is published by Houghton, Mifflin & Company, of Boston. Any public library ought to contain it, or indeed all the books mentioned.

GOLDEN GRAINS.

ON the worn features of the weariest face,
Some youthful memory leaves its hidden trace
As in old gardens, left by exiled kings,
The marble basins tell the hidden springs
—Dr. O. W. Holmes.

LEWIS says that organized structure is the platform of existence; it is the stage whereon the star actors—nutrition and propagation, motion and sensation—play their individual parts. The play is called "Life;" and accordingly as the actors perform their allotted roles—evenly, irregularly, or unnaturally,—so will the piece be successful, mediocre, or a dead failure.....

LONGFELLOW said that he venerated old age and loved not the man who can look without emotion upon the sunset of life, when the dusk of evening begins to gather over the watery eye, and the shadows of twilight grow broader and deeper upon the understanding.

WHEN one has lost the sentiment of pity out of his heart, he is not fit to live in such a world as this. He might do for some other one where there is no sin or suffering, *if there be such a one*, but here our compassions must be in constant exercise if we are to live to any good purpose.....

TALMAGE says that the kindly and songful birds have enough enemies without human antagonism. No creatures of God have a harder time to live than they; first, they have enemies in the animal kingdom, as man has in his. The eagles, the crows, the squirrels, the weasels, are their assailants. Then the hurricanes dash them against the rocks, and beat them against lighthouses, and tangle them in the telegraph wires, and toss them into the sea, and drive them back in their semi-annual migration. And they have their own distempers to contend against, and what a gauntlet of earth and sky they run before they come within range of sportsman or taxidermist. *For the Lord's sake, and for the sake of the harvests and the orchards and the gardens, of which they are the natural defenders, let them live.....*

THE CHRISTIAN UNION put the sentence: "It is not enough to *know* a thing; we must *feel* it," in large type and it deserves to be so emphasized.....

A MAN must always ask leave of his stomach to be happy.....

ALL physicians are not as frank as the doctor who, having been visited by a lazy man who complained of dyspepsia, gave him the following prescription:

RECIPE:

Woodsaw, ...	1
Cords of wood, ...	5

ORDER:

To be sawed into stove length within three weeks.....

GRANT, O Lord! that our varied experiences from day to day may prepare us for that higher life which impends over us. May we not shrink from it. May we labor so that we shall be accepted of God at whatever hour this life may end. May we not count it dear, nor seek to prolong it, nor dread its termination. May we listen for thy call. As men wait and watch for the morning through the weariness of the hours of the night, so may it be given us to long for our rest—to be homesick for heaven.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOW TO BIND THE RURAL.

ALMOST all the readers of the RURAL, without doubt keep files of their papers; but how to bind them, so as to make them handy to open, is a difficult matter. It is quite expensive to get "binders" for each volume, and then when the various issues are put in the binder, the RURAL for a year is so heavy and bulky that the binder does not secure it strongly enough for indiscriminate handling, such as my RURALS get from my children. By request of the RURAL I here show how I fix a year's numbers, and the volume has stood a year's mauling by two children, without any ill effects.

Take two slats the length of the RURAL, and about 2¼ inches wide; put them in a vice and saw out five or six notches as represented in the drawing. Then take the volume and jar the

Fig. 156.

edges on a smooth place, such as a board or table, to make them even like those of a book. Take the slats and carefully put one on each side of the back of the RURAL and put the volume in the vice, and then set the screw up tight. Have a few wires prepared, (those for ringing pigs or a little larger will do) bend each at right angles, about a-quarter or half an inch from one end. Then take the brace and bit, (use a small gimlet bit), and bore holes through the back of the RURAL at the notched places, and then put the wires through; let them run through a-quarter or half an inch, and with a hammer turn the end of each down flat, holding another hammer or weight against the bent end so that it will clinch down solid. Insert all the wires in this way, and you have a very solid book.

If a patent binder is used for the cover, fasten it to the volume in the same way. It is not necessary to put it back in the vice to do this, unless to bore the holes in their proper places. But if a binder is not used, (and most likely it will not be), get a piece of extra heavy, tough brown paper large enough for both sides and the back, and with flour paste put it on, and it will make a passable cover. It might, however, with a little care be put on before the rivets are put in.

M. H. C. GARDNER.

Niagara County, N. Y.

THE HOME.

NOTES FROM A LECTURE BY PRESIDENT HOLBROOK, OF THE NATIONAL NORMAL UNIVERSITY.

THE following thoughts on the home are gleaned from a lecture given before a large audience of young men and women,

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria

students in the school of which the lecturer is President:

"The integrity of the home is progress, power and influence. English-speaking people have the truest homes in the world, but *they* can be made better. Duties that are looked upon merely as duties, are not truly done, so in the home there must be a love for duties. When we come to the point that every law of God is a blessing, and the richest, sweetest blessing, we will be nearing the ideal He would have us reach.

The home is worthy of study, the duties of the husband are worthy of the study of every young man here. They are duties that build up the character. The man in the home ought to be the wisdom, the energy, the strength, and the business power. He ought to provide for his family and provide for the unnecessary desires of the family, as well as for the necessities. A 'good provider' is generally a good husband. The man who doles out his money grudgingly, with frowns and ugly remarks about extravagance, ought to be trounced. Abundant, generous, full-hearted provision should be made for the wants of the family. Provide generously, nobly, joyfully. 'Those who stay by the stuff' deserve half the spoils, as much now as in Bible times.

I know men who give the purse to the wife or give her an ample allowance. The wife has a right to a certain definite share of the earnings and the husband does wrong who does not recognize this. I knew of a man of wealth who invested his money here and there, but a panic coming, financial failure stared him in the face. He went to his wife, heavy-hearted, and told her of his embarassment and she loaned him $1,500, saved from her allowance during years of his generous providing, and he was saved from bankruptcy. I once sat day after day at the table of a man who every time we sat down grunted and groaned about something—the steak was tough, the potatoes were not dry, everything was wrong, he was always finding fault. You may be a good provider in cheerfulness or a good provider in niggardliness of spirit.

The husband must be kind, considerate, demonstrative, appreciative. The home is the place for reciprocal service. The best gift God can give us is to permit us to work for God's cause; but, next to this, lies the blessing of working for the home. The young man planning for a home is ready to promise everything.

How is it after marriage? The man has power to make his wife's life utterly wretched by criticism, sarcasm, fault-finding and snarling. Turn this right around, friends; praise the steak, say: 'How good this coffee is; I guess it is because you made it.'

One of the perils connected with the home is utter selfishness, usually on the part of the husband, but sometimes on the part of the wife. But the latter sort of selfishness doesn't occur once in 10,000 times as often as the former. If both are selfish; then what? Neither is willing to give up anything, and they think each other unpardonably selfish. Oh, I've seen it so many times!

Want of home liking, home love want of the feeling that home is the best place on earth, is too common. Too many men look on home as a place where they can get their meals and which they can get away from. Clubs and secret societies take away the beauty of home.

Another peril to the home is worry—business worry. A man who is amassing a fortune is in danger of carrying his business worries to his home and pouring out all the gall of his spirit on his wife, and he expects her to take it and be cheerful and sweet and charming.

Temper is another peril. A vigorous person is a man or woman of passion. If you are that sort, put yourself under control; hold yourself; you are simple and weak and silly in giving way to temper, and you may wreck the structure you have promised to perfect. You can, every one of you, make a heaven of your home. Let each determine that it shall be the best home he, with all his powers, is capable of making. Every true man and woman cherishes the hope and desire of being at some time a part of a true home. Prepare yourselves to make such a home and to cherish it above your own life."

Though this is not the entire lecture it contains in a measure the spirit of the whole. It is often urged by the President that reading is one of the delights and safeguards of a home. He says, "Good reading in the home gives health, mental power, respectability, growth in influence and power. Good books are the life of the mental system." Believing that the readers of the RURAL are people who appreciate and love their homes, and that they will be strengthened in their efforts to make home more beautiful by President Holbrook's vigorous thoughts, I have given the gist of them above. ALICE BROWN.

DOMESTIC RECIPES.

CHICKEN IN JELLY.

BOIL the chicken in as little water as possible until the meat is perfectly tender. Remove bones, skin, etc., and cut into half-inch pieces and season with pepper and salt. Take a small mold and arrange some slices of hard-boiled eggs on the bottom, then put in a layer of chicken, then more slices of eggs and chicken until all are used. Season, and skim the liquor the chicken was boiled in (there should be about two cupfuls) and while hot stir in a spoonful of gelatine which has previously been soaking in a little cold water. Pour this over the chicken and egg and set away in a cool place or on ice over night. Slice thin and serve with a garnish of parsley or celery leaves. M. B.

MINT VINEGAR.

PUT into a wide-mouthed bottle enough fresh spearmint and parsley leaves to fill it loosely. Cover with vinegar, and cork. Let stand for two weeks, turn off the vinegar into another bottle and keep well corked for use.

COOK.

SPICED CURRANTS.

SIX pounds of fruit, four of sugar, one of seeded raisins, one pint of vinegar, two tablespoonfuls of cloves, three of cinnamon and one of allspice. Boil slowly one hour, stirring constantly.

PICKLED WALNUTS.

PICK them when of a good size but tender enough to pierce with a pin Throw into a brine and let stand for three days, making new brine once during that time. Rinse off and put in the sun, turning frequently until black. Pack in jars and cover with hot spiced vinegar. MRS. A. C. E.

CHERRY PRESERVES.

THE Early Richmond will be found best. Stone the fruit, weigh, and allow the same amount of sugar. Take half the sugar and sprinkle over the fruit. Let stand an hour or longer, then put over the fire in a porcelain kettle and boil slowly for 10 minutes. Then skim out the cherries, add the remaining sugar, boil, skim and turn over the fruit. Cover and keep in a cool place until the next day. Drain off the sirup, boil, skim carefully, put in the cherries, boil for 10 minutes and seal up in small jars.

MRS. H. JONES.

RASPBERRY PUDDING.

MAKE a soft dough, using sour cream and soda, and stir in rasp'berries or blackberries Put into a tin pail having a tight-fitting cover and place in a kettle of boiling water. Boil three hours, not once letting the water stop boiling. Eat with sweetened cream. The mixture should, when put in, not quite half fill the pail. MRS. BUXTON.

CURRANT PIE.

ONE full cup of ripe currants, mash and add a cup of white sugar, one table-spoonful of flour made smooth in two spoonfuls of water and the beaten yelks of two eggs. Mix and pour into a tin lined with a good crust. Bake slowly. Beat the whites of the eggs stiff, add two spoonfuls of powdered sugar, spread over the pie, return to the oven and brown lightly.

COOK.

FROZEN STRAWBERRIES.

LINE a mold with vanilla ice cream—sides and bottom—fill the center with fresh strawberries, raspberries or peaches, sprinkled with powdered sugar, cover with ice cream, cover tightly and pack in salt and ice. Serve in about half an hour. The fruit should be thoroughly chilled, not frozen.

BROILED WOODCOCK.

DRESS and wipe carefully, split through the back and broil over a clear fire. Dip in melted butter and serve on a thin slice of toast with a piece of broiled bacon.

MRS. ECONOMY

ICED CHERRIES.

DIP the fruit by the stems into beaten whites of egg, sift powdered sugar over them and put in a warm place until dry.

MRS. A. C.

POTTED FRESH FISH.

DRESS, and let remain in a weak brine three or four hours. Drain and cut into slices. For five pounds of fish allow three ounces of salt, two of black pepper, two of cinnamon, one of all-spice and a half ounce of cloves. Place in an earthen jar a large layer of fish, then one of the spice (mix all together) with a sprinkle of flour and a few bits of butter, repeatedly till done. Cover the fish with equal parts of vinegar and water. Cover the jar with a cloth well floured on top so that the steam cannot escape and bake six hours. Let remain in the jar until perfectly cold. Excellent for supper.

EGGS ON TOAST

BEAT eight eggs until very light, add a cup of sweet cream and a little salt. Turn into a well greased pan and place over a moderate fire. Stir until the mixture is cooked through but not hard, and turn over pieces of nicely browned and buttered toast. MRS. E. C. D.

MOTHER'S HARVEST DRINK.

ONE quart of water, a table-spoonful of ginger, three table spoonfuls of white sugar and half a pint of vinegar.

MUSTARD.

HERE is the way that mother also prepares our mustard. Put a pint of good vinegar over the fire. When it boils stir in one-fourth pound of ground mustard, two tea-spoonfuls of salt, two table-spoonfuls of sugar and a tea-spoonful of white pepper. Boil slowly two or three minutes and turn into small bottles. Seal and keep in a cool place.

ELIZA BAXTER.

CHERRY CATSUP.

ONE quart of sour cherry juice, one pound of sugar, two tea-spoonfuls of cloves, two of cinnamon and a very little Cayenne pepper. Boil until thick, bottle and seal.

MRS. CRANE.

News of the Week.

HOME NEWS.

SATURDAY, June 15, 1889.

THE latest returns from the Conemaugh Valley put the number of deaths in the neighborhood of 4,000. Considerably over $3,000,000 in money has been subscribed for the relief of the sufferers—enough to give about $650 to each surviving family. Enormous quantities of clothing, provisions, etc., have also been given. At first about 7,000 men were set to work at $2 per day and rations, clearing off the wreck and burying the dead. Last Wednesday the State of Pennsylvania took official charge of the work and cut down wages to $1.50 a day and rations. All the workmen left except about 250. New hands are pouring in, however, and by Monday over 3,000 will be at work repairing damages, etc. Governor Beaver proposes to get $1,000,000 from the banks to be expended in whole or part in clearing up the valley which is to be done as a State sanitary precaution. A large number of prominent merchants have signed an indemnity bond to secure the bankers who may advance the money, should the legislature refuse to make an appropriation to pay it. It would cost $250,000 to $300,000 for a special session of that body and the work can probably be done for nearly that amount. The Cambria Iron Works which employed about 6,000 hands, have already started with 1,500, and will employ more as soon as they turn up and repairs and rebuilding give more room. Merchants are already starting afresh, and wholesale dealers elsewhere are liberal in giving them long credits. The 800 police and deputy sheriffs who did little good and added much to the troubles of the people have been dismissed. A handful of 32 policemen now look after things, while the soldiers maintain peace and prevent plundering. Tramps and thieves still try to ply their trade there, but on detection are jailed or banished. The expenses of keeping the people are put at $3,500 per day, but as wages are earned and business progresses, the necessary outlay will rapidly diminish. How best to lay out the generous charity of the public is now the vexing problem. About $330,000 of New York's cash donations are still here awaiting advices from Governor Beaver and the other authorities on the spot. Investigation shows that the reservoir dam was criminally weak in its construction. The owners of the lake have converted the Club House into an orphan asylum for the victims of the flood, and doubtless they will support it liberally. There is some talk of prosecuting them criminally, and more of suing them for damages..... Once more there's a great deal of talk about the establishment of a Plug Tobacco Trust with a capital of $25,000,000, to include all the important manufacturers in the United States. They are to sell out to the trust and then take stock for the amount of the valuation of their plant. There are several denials of course, as usual. The concocters of such schemes want to spring them full-fledged on the public.....Reports from the Standing Rock Indian Agency in North Dakota, say that Sitting Bull has been dangerously ill from pneumonia for some time and is so steadily sinking that he must soon pass into the "happy hunting grounds" where buffalo ghosts still range in millions. Of late he has lost all influence with the Sioux.... ...The salary of a New York alderman is $2,000 a year, of which he sometimes saves over $10,000, besides spending $5,000 in "treating" and "loans" to his constituents.....John Anton Wolff Grip is the new Scandinavian Minister to Washington.....The Inter-State Commerce Commission has been investigating the Kansas City Hog Trust, an offshoot of the Chicago Big Four syndicate..... The internal revenue receipts, beginning with 1863, when such taxes were first imposed, show that the beer business has grown in the last quarter of a century from the production of 2,006,625 barrels to 24,680,219 barrels. The internal revenue taxes have increased in the same time from $1,500,000 to $23,000,000.. ... .A San Francisco firm has just built the largest wine cellar in the world, with a capacity for 3,000,000 gallons, at a cost of $250,000. It looks as if Prohibitionists would have a poor chance in the "Wine State."..... It is proposed to start a Rubber Boot and Shoe Trust for the purpose of maintaining steady prices high enough to be profitable to manufacturers, jobbers and retailers..... Forest fires are doing a world of damage south and west of Superior, Wis..... Canadian Odd Fellows, in session at Montreal, have refused to admit colored men to membership.....Recent yacht races in England having shown that Lord Dunraven's new flyer, the Valkyrie, is not much faster than other crack English yachts, her owner intimates that he will not contest for the America's Cup this year, as the Volunteer could outsail his boat. As no other English boat can be built in time, there will therefore be no race..... Myriads of locusts have appeared in the wooded districts around Barrville, Pa..... The 17-year locusts are due in New Jersey this year.....W. E. Chandler has once more received the Republican caucus nomination for Senator in New Hampshire. The Ex-Secretary of the Navy is certain of re-election.....Governor Gordon, of Georgia, says that more men were killed in our civil war than England has lost in her nearly constant warfare since William the Conquerer; the statement is said to be absolutely true.... .... .The latest trust is one by the makers of castor oil, on which there is an import duty of 80 per cent..... ..... Ex-Senator Sabin, of Minnesota, has been quietly divorced from his wife on the ground that she has become a comfirmed drunkard and opium eater. This her friends indignantly deny. For some time she has been in an inebriate asylum at Flushing, Long Island, at her own request.....Mrs. Harrison, her old father, Dr. Scott, and her grandchildren, including of course, Baby McKee, are at the sea-shore at Cape May, N. J..... ...The Dr. Cronin murder case at Chicago still attracts a great deal of attention not only there but all over the country. Alexander Sullivan, a prominent Chicago lawyer and Irish leader, ex-president of the Clan-na-gael, has been arrested as an accessory to the murder. There's no doubt that it was a cool, premeditated crime perpetrated deliberately by an association one of whose cardinal tenets is the justifiability of political assassination by Irishmen. The members arrogate to themselves the right to try, condemn and execute offenders across the water and in this country also. Of course, as the coroner's jury justly said, such an organization is inconsistent with the spirit, and against the interests of this country and should be at once abolished, under whatever name it may act. Two alleged accessories have been arrested in this city; but for the present Governor Hill refuses to surrender them to the authorities of Illinois..... The loss by fire at Seattle, Washingon, is even greater than was first announced. The town, like all new, tentative places, was built nearly entirely of wood, with crooked, irregular streets. High rents prevented the tearing down of the buildings, and improvements generally. Now that all the old business part of the town has been destroyed, the streets will be laid out more regularly and fine buildings will replace old, ramshackle frame affairs. The fire may, therefore, have been a "blessing in disguise." Charity has liberally helped the needy, and with true far-western grit and energy the place is already being rapidly rebuilt, and business even among the ruins of the "old" and the bricks and mortar of the "new" is once more booming..... Governor Ames, of Massachusetts, has appointed Col. Thomas Wentworth Higginson to be State Librarian and Military and Naval Historian with a salary of $2,000 for five years and $500 a year for expenses. An excellent appointment.....Governor Hill, of New York, has signed a bill for the suppression of "bucket shops." Will it suppress them?.....The Canadian sealers of British Columbia say they will resist seizure if overhauled by American cruisers in Behring Sea.....Several months ago Attorney-General Hogg, of Texas, began suit against the Southern Pacific railway and other lines for the return to the State of 15,000,000 acres of land which had been given to the railways on certain conditions. These conditions the State showed were violated, and the forfeiture of the lands was demanded. Judge Key decided in favor of the State, and held that the railroads had wilfully violated the conditions and had no title to the lands. A great portion of the lands has passed into other hands, having been sold by the railroads, and under the decision the supposed owners have no titles. Mr. Calvin S. Brice, the genial many-time millionaire, who managed the last Democratic national campaign, and contributed towards its expenses, has been unanimously chosen Chairman of the Democratic National Committee to succeed the late Hon. William H. Barnum. Looks as if the Democrats intend to maintain in 1892 the tariff position they held in 1888. .....Over 700 singing birds secured in Germany have been liberated near Portland, Oregon. Are they friends or enemies of the farmer and horticulturists?.....The trial of the "electric" sugar refiners is going on here now, and makes "mighty interesting reading." The swindlers bought the best refined sugar in the form of cubes, broke these cubes with hammers, and, after sifting the pounded sugar, passed it down a shute into a receiver, where it was exhibited as a product of their "electric" refining process. This was certainly one of the simplest swindles ever practiced upon gullible men—and keen-eyed business men at that!.... Party lines are not drawn on ballot-reform legislation. In Illinois, Pennsylvania, Maine and Ohio, Republican legislatures have rejected ballot-reform bills. In Connecticut, Massachusetts and New York Republican legislatures have approved such bills, while a Democratic Governor in New York and a Republican Governor in Connecticut have vetoed them. The people appear to demand such legislation, but "practical politicians" see neither office nor boodle in a scheme that promises to prevent fraud, bribery and intimidation.....The Weldon extradition bill recently passed by the Dominion Parliament has been submitted to the imperial government for ratification. It is the first case on record which provides for the extradition of criminals by an act of the legislature instead of by a treaty. It's likely to be ratified. People say it is retroactive; but as the Parliament voted down an amendment declaring it so, it's hardly likely that the government will extradite the "boodlers" now across the border ....Col. John C. Kelton, 61 years old, a graduate of West Point, and a distinguished soldier in the late war, has been appointed Adjutant General of the Army to succeed General Drum "retired" for age..... .....After the "Glorious Fourth" "Old Glory" is to be emblazoned with four more stars to represent the four new States, the Revised Statutes providing that such addition is to be made "on the fourth day of July next succeeding the admission" of the State or States .....The Grand Jury here have indicted the three doctors who carved mind-reader Bishop so prematurely, for having cut him up without authority from the coroner or relatives.....That English syndicate has just added to their long list of American breweries, one at Newark, N. J., for which they paid $5,100,000—$4,000,000 in cash; the balance in stock..... The American Executing Company is the title of a Chicago concern, with a capital of $25,000, which wants to do all the legal hanging and electro-killing throughout the country on contract.....

An Honest Skeptic.

Does Skepticism pay?

The enthusiastic has his answer ready—No!

However, we differ, although our devotion to Compound Oxygen comes under the head of enthusiasm.

We differ because an honest skeptic is one who insists on proof in support of assertion.

Can you find fault with that? Hardly, since as a rule, it is your own plan of procedure.

However, we will step in advance of usual method and call attention to proof without assertion. That is, we will say nothing and leave our case in the hands of those we have benefited.

Rev. Chas. W. Cushing, Rochester, adds to former testimonial:

Feb, 14, 1888.

"The treatment you sent my daughter for chronic ulceration of the throat a year ago, was very effectual. It was the first thing which seemed to do her much permanent good."

CHESTER, S. C.

"I believe in the remedy and can therefore recommend it." REV. H. T. CHREITYBERG.

ST. PAUL, MINN., March 20, 1888.

"For giving the system permanent vitality and the elimination of disease I believe Compound Oxygen to be far in advance of all medicine or treatment." H. H. COOK.

NASHUA, N. H., Feb. 14, 1888.

"I commenced your Compound Oxygen treatment the last of August, 1887, and was happily surprised at the end of one month to find I was almost entirely relieved."

MRS. C. K. DAGGET.

WEATHERFORD, TEXAS, April 1, 1888.

"You have my heartfelt gratitude for the good your Compound Oxygen has done me."

MRS. FRAKIE EDWARDS.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv*

FOREIGN NEWS.

SATURDAY, June 15, 1889.

AN agrarian congress opened at Paris this week. Mr. Saunders was elected American secretary. Henry George made an address in which he referred to land reform as the starting point of social reform. Mr. George was unanimously elected honorary president. M. Lonquet was chosen chairman and made an address in which he spoke in terms of warm praise of Mr. George. Rather strange, this attempt to introduce Henry Georgism into the land of peasant land proprietorship par excellence!..... The latest news from Stanley comes by way of Zanzibar in a letter dated December 2; but which must have been written in February, "authorities" say. He was at Usuri at the southeast end of Lake Victoria Nyanza, having suffered heavy losses of men on the journey from Arumiwi. Emin Pasha was not with him; but he may have been following. After resting at Usuri a short time, he had returned to Victoria Nyanza to secure stores which had been deposited for him at Insalala a year ago. In sufferings, heavy losses of men and stores and failure of the object of the expedition, this has been by far the most disastrous of all Stanley's journeys in the Dark Continent.....Russia, Germany and Austria have sent an identical note to the Swiss Government demanding that it should deal more severely with Anarchists and Socialists..... ....The Shah of Persia has just made a visit to Russia where he was right imperially entertained with military reviews and other grand public displays. Then he went to Germany, where he is now receiving much the same kind of a reception. Russia and England are strenuous rivals for a preponderance of influence in Persia, and it is said that the Czar intimated that if the Shah made any concessions to England during his projected visit there, 100,000 Russian troops now on the north of Persia would at once enter the country. The report is hardly diplomatic, but is significant.....The French government is still trying to devise some means of helping the Panama Canal without taking on itself too much responsibility or embroiling itself with this country. The 800,000 Frenchmen who have put money in the venture must be soothed if not aided..... The worst railroad accident that ever occurred in Ireland happened near Armagh last Tuesday. An excursion train, in three sections, containing 1,200 passengers, nearly all Methodist Sunday School children, left Armagh for Warren Point, a watering place at the mouth of the river Newry in County Down. In ascending a steep grade on a bank 76 feet high, the first section passed on all right but the engine of the second section couldn't haul up the cars which ran madly down the slope smashing into the engine of the third section which was following. Seventy persons were killed, most of them being about 20 years old, and only a dozen children. The elders were in the rear car, hence the great mortality among them. Several hundred were more or less severely injured..

AGRICULTURAL NEWS.

SATURDAY, June 15, 1889.

UP TO the last week in May, crop prospects were exceptionally good in nearly every part of the country. May 23, some parts of the country were visited by frosts, but no extensive damage was done. May 29,30 and 31, a large part of New England, Northern and Western New York, Northern Ohio, Indiana, and Illinois, Michigan, Wisconsin, Iowa and Minnesota were visited by frosts of greater or less severity, while parts of Michigan and Wisconsin were snowed under to a depth of six inches. These were immediately followed by heavy and long-continued rains, which, added to the heavy rains during the latter part of May, have caused disastrous floods in many parts of the country. Pennsylvania and Maryland have perhaps been the greatest sufferers from the latter cause, although many other localities have been damaged to a greater or less extent. As a general thing, throughout the East, there has been too much rain for the lowlands. The frosts through the localities visited have wrought havoc with all kinds of fruit, have greatly injured corn and potatoes, and, in some instances, grain and grass, and

have destroyed much garden truck. The cool, wet weather has been very favorable for keeping in check all kinds of insects, and in this may be found some compensation for losses in other directions. Except where the superabundance of moisture has caused floods, the prospects for abundant crops of grain and grass are good. The greatest loss from the unseasonable weather, is with the fruit crop, which is reported entirely destroyed in some places, but it is to be hoped that the results may not prove so disastrous as is now feared.....

The Indian agent at the Umatilla Agency, Oregon, reports that on May 23, the last band of intruding cattle and sheep were removed from the reservation; 40,000 sheep and 10,000 cattle in all were removed. Vigorous measures are to be adopted hereafter to keep all trespassing cattle from the reservation.....Last year Congress appropriated $100,000 to be used by the Department of Agriculture in experimenting with sorghum cane as a sugar producer. Of this sum less than $15,000 were so expended, and Congress gave the Department the unexpended balance to continue the work. Secretary Rusk has decided to expend the entire amount this year and made the following allotments: Rio Grande, N. J., $7,500; Morrisville, Va., $3,500; Kenner, La., $5,000; Meade Center, Kan., $12,000; Conway Springs, Kan., $8,000; Attica, Kan., $6,000; Medicine Lodge, Kan., $6,000, Ness City, Kan., $4,000; Stirling, Kan., Experiment Station, $2,500; Cedar Falls, Iowa, Experiment Station, $5,000; general chemical control and direction, $15,000. One thousand dollars were reserved for experimenting with beet culture, and this amount will be divided between the stations at Madison, Wis., and Berkeley, Cal.....The trotting-horse breeders of the Pacific coast have organized a Breeders' Association.....October 1st, next all the publications and properties appertaining to Wallace's Monthly will be turned over to the Wallace Trotting Register Company. This company has been incorporated with a capital of $100,000, in shares of $100 each. It is intended to give every reputable breeder in the country an opportunity to become a stock-holder.....The New York State Agricultural Society will offer the State Dairy Association facilities for holding daily dairy conferences at the coming State Fair.... The Board Managers of the New York State Dairy Association arranged to hold the present summer 30 Dairy Conferences in the various dairy sections of the State.... ...Of the 2,637,000 cattle slaughtered for the dressed beef trade last year, 2,050,000 met their death at Chicago .....The Wisconsin Horticultural Society will hold a meeting at Baraboo, June 19 and 20. In addition to the exhibition of fruits and flowers, an interesting programme has been prepared.....

Peter Henderson offered at the last meeting of the Society of American Florists, $100 for the best herbarium of native plants collected between August, 1888, and August, 1889. The award will be made at the meeting in Buffalo in August.....California hopes to become a great seed-growing state. The single county of Santa Clara has 1,200 acres devoted to this industry, and has shipped 60,000 pounds of lettuce seed, and 20,000 pounds of onion seed to the East in a single season..... ...It is said that repairs to Pennsylvania's fences cost about $5,000,000 each year. In some cases the inclosures are worth more than the land they protect.....

The latest invention reported is one to extract the butter directly from the milk.....

It requires 15,000 horses annually to supply New York.....A resident of Terra Haute, Ind., where hogs are permitted to run at large in the streets, removed the fences around his house, and has begun 119 law-suits to recover damages from trespassing hogs.....The introduction of phylloxera into Asia Minor appears to have been the result of a deliberate importation of the vines from a country where the disease was known to exist.....Arrangements have been completed for landing California fruit on the dock at New York in the original cars, instead of transferring it at Jersey City as formerly.....The firm of B. & J. W. Belcher, lately manufacturers of agricultural implements at Chicopee Falls, Mass., is insolvent.....

Mr. Whitman of the Whitman Agricultural Works, St. Louis, left on Wednesday for Paris, where the company have a hay-press on exhibition at the Exposition .....H. M. Roberts, East Hartford, Conn., brought the first bushel of green peas, Hawley's Exta Early, to C. D. Hawley & Company, on May 23, thus winning the $10 prize. J. H. Griffith of Pearsalls, Long Island, reports Early Essex potatoes as large as hens' eggs June 5.....

The American Seed Trade Association elected as officers for the ensuing year: Herbert V. Johnson, Philadelphia, president; J. C. Vaughan, Chicago, and R. Miles Rice, Cambridge, N. Y., vice-presidents; Albert McCullough, Cincinnati, secretary and treasurer. An executive committee was also elected. There was considerable opposition manifested to the free distribution of seeds by the government, but no action was taken. The next annual meeting will be held at Saratoga.....

The experiment of planting American grape vines in France to combat the phylloxera has proved successful, and the demand for such vines was this year greater than the supply.....Kansas City received 15 car-loads of Mexican oranges during the past season. They are said to be very fine and of good quality.....Secretary Rusk has made arrangements to issue veterinary bulletins devoted to the diseases of horses, cattle, sheep, etc. ...Fruit is shipped from California to Eastern cities on special fast trains of 10 cars each, loaded not to exceed 22,000 pounds per car. The charge to Chicago, St. Louis, Minneapolis, and contiguous points is $1,500 per train; to New York $2.00 additional per 100 pounds. For cars attached to passenger trains, $2 50 per 100 pounds to Chicago, $3.12½ to New York, and $3.22½ to Boston, are charged: rates by regular freight are much lower, but are very unsatisfactory, as are those for cars attached to regular passenger trains.....

The Chief of the Bureau of Statistics reports that the total values of the exports of beef, hog and dairy products from the United States during the month of May, 1889, and during the five months ended May 3., 1889, as compared with similar exports during the corresponding periods of the preceding year, were as follows: May, 1889, $8,225,692; May, 1888, $7,166,937; five months ended May 31, 1889, $44,448,495; five months ended May 31, 1888, $33,270,783.....

The New Era Exposition is to be held at St. Joseph, Missouri, from September 3, to October 5. Large premiums are offered, and every preparation will be made to insure a successful exhibition. For particulars address as above.....The State Veterinarian of Missouri has issued a circular with a set of questions the answers to which are designed to aid him in controlling infectious diseases of cattle in the State.....Three months after Prof. Cook issued his book "Silos and Silage," 2,500 had been sold. This shows the interest farmers are taking in this subject .....Cattle thieves are operating in Southern Dakota.....New stock-yards having accommodation for 10,000 head of cattle are being built at Minneapolis. It is expected the company will do a $5,000,000 business the first year.....

SPECIAL BUTTER, CHEESE, AND HOP MARKETS.

UTICA, N. Y., June 15, 1889.—The ruling prices of cheese are lower than for several years at this season, and sales were heavy. Prices ranged from 7⅞ to 8¼ cents. The butter market is firm, and the quality of the offerings has improved. The price ranges from 17 to 20 cents.

Ordinary hops, crop of '88, sell for 20 cents, while '87's sell for eight cents. The yards are reported in fine condition, equal to the usual July appearance, and the indications are that the crop will be fully up to the average or above it.

LOUDEN'S HAY SLING.

CLEANING UP RACK.

"Cleaning up the rack," is the most troublesome part of unloading hay with a horse fork. Frequently forks, which work well in taking off the top of the load, fail completely in cleaning up the bottom. To remedy this difficulty is the object of the device herewith illustrated.

The sling is first spread on the rack, and the hay is built upon it. The top is taken off with the fork as usual, and then the sling is attached. The remaining hay is rolled up, as shown in the cut, and the rack is cleaned at a single draft.

The manufactnrers of the Louden hay tools, for the sake of introducing their new Self-Compressing Center Trip Hay and Grain Slings, offer this outfit at the following special prices, good for this season only (1889): Cleaning up outfit for one wagon, $4.50; two wagons, $7.50; three wagons, $10.00.

The outfit can be used with any kind of carrier or stacker, or any elevator using a fork. It can be sent cheaply by either freight or express, and will be forwarded to any address on receipt or price.

For further information concerning this or their other haying outfits, for either field or barn, address Louden Machinery Co., Fairfield, Iowa.

FOR SALE
In Ithaca, N.Y., bordering on the City Line
A FRUIT FARM
Of Twenty-three Acres, having an Eastern and Southern exposure, in Peaches, Plums, Apples, Pears, Grapes, black and red Raspberries, Blackberries, Strawberries, and Seven Acres of Grass. Nearly all young and thrifty trees and vines, many just coming into bearing. Is about 25 minutes walk from the City Post Office, 15 minutes from the street cars, and within 45 minutes walk of Cornell University. Ithaca has the best schools, and this would be a desirable place for a family wishing to educate children, and at the same time have the means of making a livelihood. Can be bought on easy terms. Call on or address
H. P. JOHNSON, No. 2 West State St, Ithaca, N.Y.

THE GRANGER FAMILY FRUIT AND VEGETABLE
EVAPORATORS.
$3.50, $6.00 and $10.00.
Send for circular. EASTERN M'F'G CO., 253 S. Fifth St., Phila.

OHIO ENSILAGE AND FEED CUTTERS
Our Improved 1889 Cutter contains many new and valuable features. Strong and durable, easy to operate, not liable to accidents. Treatise on Ensilage and Catalogue, also Plans for Silo, Free.
SILVER & DEMING MFG. CO., Salem, O.
HENION & HUBBELL, 55 N. Clinton St., Chicago, Western Agts.

LONDON PURPLE

Can SAVE YOUR CROPS from Potato Bugs, Canker Worms, and most insects.
"LONDON PURPLE"
Will SAVE YOUR MONEY. It is one-half the price, and does three times the work of the usual poisons.
"LONDON PURPLE"
Is SAFE TO USE—its color shows where it has been applied. Be sure to get
"LONDON PURPLE"
and not spurious imitations. Send for circular and opinions—free.

The *New York Herald* says: "'London Purple' is preferable to White Arsenic or Paris Green, as it is not so liable to burn the leaves, and its color enables one to distinguish readily between poisoned and non-poisoned trees."

90 Water St., NEW YORK. 60 Mark Lane, LONDON.

Indust'l Societies.

THE TENTH ANNUAL EXHIBITION OF THE MOORESTOWN AGRICULTURAL AND INDUSTRIAL SOCIETY.

(RURAL SPECIAL REPORT.)

THE annual spring exhibitions of the Moorestown Agricultural and Industrial Society have always attracted a good deal of attention, and the exhibition held at Stanwick Station, on the 6th, 7th, and 8th of June, was no exception to the general rule. Nearly all the leading manufacturers of farm machinery in the United States were represented; and visitors from all parts of the country were present. The president of the society, Mr. Edmund Cook, is a thoroughly practical man, and, as he says, he has tried to model the Moorestown fair after the ideal fair so often described on the editorial pages of the R. N.-Y. It is certainly a fair of the farmers, for the farmers and by the farmers. The manufacturers of implements understand this, and send their best specimens and ablest agents here, and are usually rewarded by large sales. Excitement is furnished by competitive trials of harvesters, mowers, cultivators, plows and other farm implements, instead of by horse-races and side-shows. The fair comes at a time when farmers are anxious to learn about the merits of different machines with a view to purchasing them.

Prominent features of these exhibitions are the displays of strawberries and small fruits. Unfortunately the season was about two weeks earlier than usual, and many of the best berries were through bearing, and in consequence some of the leading growers, like Wm. Parry and Thomas Zane, made no exhibit. Samuel C. DeCou, of Moorestown, and Chas. B. Horner, of Mt. Holly, however, made fine displays, and saved the reputation of the association. Nearly all the leading varieties of strawberries were shown. With the exception of Bubach No. 5. and the new seedlings, very little attention was paid to the newer varieties. For market purposes Sharpless was considered the best; Ontario next; with the Crescent a good third. The seedling originated by Mr. Silas Walton, of Moorestown, and known as the "Walton," attracted a good deal of attention. (It will be remembered that this berry was illustrated by the R. N.-Y. two years ago.) It was exhibited by Mr. C. B. Horner, of Mt. Holly, who also exhibited a new seedling as yet unnamed. Mr. Horner has, however, the name of "The Gem" under advisement. If it has not already been taken it will be the name of the new berry. Mr. De Cou showed some new seedlings of the Felton. A new seedling to be introduced under the name of Chair's Seedling, attracted much attention. It was found by Mr. Chair in the woods in the suburbs of Baltimore, and seems to be a new and distinct variety. One plant contained 60 perfect berries besides many smaller ones. It is large in size, of good form and quality and seems to be very prolific.

Some of the earlier cherries were shown, also a few peas and potatoes. The display of vegetables, however, was not as fine as it should have been in a locality so largely devoted to market gardening.

The domestic department was well filled with pies, cakes and other appetizing products of the culinary art.

The display of implements was very large and complete. An acre or more of land was covered with an infinite variety of farm machines and tools. There were at least a dozen kinds of reaping, harvesting and mowing machines: in fact, nearly all the leading manufacturers were represented by their most eloquent agents. The mowing machines seemed to attract the most attention. One old farmer spent an hour or more listening to the claimed merits of the various machines, and finally concluded that they were very much alike. "'Most any on 'em will cut grass, and that's all I want," he said. The number of new devices for lessening the friction and side draft and increasing the cutting power of mowing machines seems endless. The "screw machine," with a screw gearing and a floating cutter-bar, was eagerly watched and favorably commented on. It is not a new machine; but has been greatly improved since last year. It is now made by the Kennett Wagon Company, at Kennett Square, Pa. Poulson's and the Dutton mower knife-grinders were kept in operation preparing the knives of the machines for the trials. Both did good work. The trial of harvesters attracted such a crowd that it was impossible to judge of the merits of the machines.

In the trial of sulky cultivators there were three entries—the Little Diamond, Bird's and the Hudson Bicycle. All did good work and each had its friends.

Clark's Cultivator, made up of two small cutaway harrows, did some excellent work and promises to be a popular implement. Coffin's milk Aerator occupies a prominent position on the grounds. Exhibits were made by P. P. Mast & Co., Hench & Dromgold, D. H. Nash, the Gale Manufacturing Co., and other manufacturers.

Gardiner's road wagon has the advantage of a low-down wagon on high wheels. This reduces the labor of loading, and, it is claimed, makes the draft lighter. Messrs. A. Blaker & Company made the largest exhibit of the larger kind of farm machinery: their new Fenton thrasher and cleaner was shown in operation, being run by the Newtown double geared horse-power. This firm is making a new sheller and separator known as the Newtown Star sheller and separator. It is one of the most complete machines of the kind I have ever seen.

Several new methods of building fences were shown. One of the devices was a "wire lock" for holding the rails of an ordinary worm fence together. It seemed to work very well. Another fastened the ordinary post-and-rail fence with wire so that it would stand even after the posts had rotted off. The Garrett fence machine was shown in operation. It is a low-priced machine, but does good work.

The attendance was all that could be desired and the weather was perfect. In fact, the 10th annual exhibition of the Moorestown Agricultural and Industrial Society may be ranked among the best of the spring exhibitions.

J. H. G.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

A STALLION'S SERVICES IN MAINE.

H. S. T., Lincoln County, Me.—Some time ago I bred an excellent mare of mine to a stallion whose owner charged a big fee on account of the fine pedigree he claimed for his horse, and the speedy records of some of his alleged offsprings. Now I find that all his claims with regard to the stallion were unfounded, so that I am "out" not only the fee which I paid, but also over 12 months of my mare's time for breeding purposes. Have I any redress?

ANS.—A recent law in Maine provides as follows: "The owner or breeder of a stallion for breeding purposes, before advertising, by written or printed notices, the service thereof, shall file a certificate with the register of deeds in the county where said stallion is owned or kept, stating the name, color, age and size of the same, together with the pedigree of said stallion, as fully as attainable, and the name of the person by whom he was bred. And it shall be the duty of such register to record such certificate in a book kept for the purpose. Copies of such certificate, duly certified by such register, may be used in evidence, the same as the original, in any State. The fee of the register for recording, and for each certificate, shall be 25 cents. Whoever neglects to make and file such certificate shall recover no compensation for said services, and if he knowingly and willfully makes and files a false certificate of the statements aforesaid, he forfeits $100 to be recovered by complaint, indictment or action for debt, for the county where the offence is committed."

ADMINISTRATING ON PROPERTY IN ANOTHER STATE.

T. L., Waterloo, N. Y.—An old resident of Alton, Illinois, died recently without having made a will. He left some real estate and other property in Alton, and a farm in this State. Can his administrator, appointed in Illinois, administer on the property left in this State, and if he undertakes to do so, is he responsible, and can his bondsmen be held responsible if the property is not properly administered?

ANS.—The Illinois courts hold that a grant of administration in that State confers upon an administrator no title to property of an intestate situated outside of the State. He has no authority whatever over it, nor is he responsible for any part of the intestate's estate which is beyond the jurisdiction by which he was appointed. Such administrator in his official capacity can neither sue nor be sued outside of the State from which he derives his authority, and to which alone he is amenable. If he wishes to reach property belonging to the estate, but situated in a foreign jurisdiction, he must obtain letters of administration there and give such security, and become subject to such regulations as the laws may prescribe. His bond covers only his duties as to property situated within the State in which he was appointed.

S. C., Davenport, Washington.—What is the law with regard to placing poison on one's own inclosed premises for the purpose of destroying jack rabbits and other pests.

ANS.—If the premises are inclosed as the law directs, placing poison in them for the above purpose is quite lawful.

T. L. L., Seneca County, N. Y.—A married woman owns a small farm in her own right, while her husband owns a much larger one. In case of a law suit, should the woman sue under her own name—say as Mrs. Mary Brown—or under her husband's—say as Mrs. John Brown?

ANS.—In all legal proceedings and documents, whether as grantor or grantee, plaintiff or defendant, a married woman is described by her own proper name, as Mrs. Mary Brown.

C. E. D., New York City.—A man subscribes for a paper, the price of which is $1 50 per year, or $2.00 if not paid in advance. He pays for one year upon subscribing. At the end of the year the paper is not stopped, but keeps on coming. He takes it, but neglects to pay up. Three years pass, then comes a notification that if the bill is not paid by a certain time interest will be charged on each year. Can such a demand be legally enforced? Is the subscriber liable for more than the face of the bill, $2. for each year's subscription?

ANS.—Yes. It is a mean law, though.

Inquirer, Steuben County, N. Y.—Is there any law in this State to regulate the charge of doctors?

ANS.—No. Fees are not regulated in New York State by statute law. If every man who has had the advantage of a doctor's service paid him a reasonable fee, there would be little complaint of charges, as the fees would be too low for grumbling. There is no class of professional men, and indeed no class of wage-earners at all, who do so much work gratuitously and to whom so large a proportion of their earnings remain for a long time due as doctors; indeed a great amount of their fees is never paid.

J. W. A., Newburyport, Mass.—I hired a house and built a hen-house in the garden. It was not built on any foundation. The frost being in the ground; the building was made to rest on blocks laid on the snow. Have I a perfect right to remove the building, provided no injury is done to the landlord's property?

ANS.—Yes. Under such circumstances the house was a "chattel," which is movable, not a "fixture" which is immovable. In general whatever a hirer of land buys or makes to use on the land and fasten to the land or building, if he fastens it in such a way that he can remove it and leave the land or building in as good order and condition as it was before, he may remove or take it away whether a tenant for life, a term of years, or at will.

ORIGINAL IN ALL ITS DEPARTMENTS.

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:

"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:

"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:

"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:

"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:

"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:

"The RURAL NEW-YORKER is the best agricultural paper in the country."

From Josepn Harris, Moreton Farm, N. Y.:

"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined.

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

The Rural New-Yorker,

34 Park Row, N. Y.

CATALOGUES, ETC., RECEIVED.

LOUDEN'S HAY AND GRAIN SLING.—Circulars from the Louden Machinery Company, Fairfield, Iowa. This sling is used for handling all kinds of hay, straw, sorghum fodder or grain either bound or loose. It seems like an excellent device. It is most admirably explained and illustrated in this circular.

THE SPAYING OF CATTLE; COTTON SEED HULLS FOR FATTENING.—A few weeks ago the R. N.-Y. gave as an item of news the fact that the Arkansas Station proposed to get rid of scrub cattle by promoting a general interest in spaying cows. It was also stated that such cattle, in the Southern States, might be fattened on cotton-seed hulls. An explanation of this plan will be found in bulletins No. 8 and 9 of the Arkansas Station, Fayetteville, Arkansas. The first bulletin discusses spaying. First, an effort is made to justify the operation. It is claimed that the operation is but little more painful than that of castrating, that it enhances the value of the animal—making better beef and more of it,and that it is a sure means of stopping the breeding of poor cattle The classes of animals that should be selected for spaying, according to this bulletin, are the following:

"First, and chiefly, heifers under one year old, which are not intended for milch cows, and which are not wanted for breeding purposes. Second, older cattle, either heifers, or cows that have had one or more calves, and which it is desired to fatten for beef; and, finally, cows in any dairy in full flow of milk, and whose calves it is not profitable to raise, may be included as suitable for testing the effect on the milk production."

Then follows a description of the operation and an account of its effect upon several animals. As to the merits of spaying, the R. N.-Y. opposes the practice. From the best information it can get the operation is horribly cruel, unless performed by a skilled veterinarian. It is hard to conceive of anything more revolting than the spectacle of poor brutes mangled and tortured by amateur operators. At the same time the R N.-Y. knows that the practice is growing at the West. We do not believe the cattle interests of the country demand this thing. At any rate let no bungler ever attempt it. If it is done at all, let it be done by somebody who can do it skillfully.

Bulletin No. 9 treats of a much more cheerful topic. This is the hoped for discovery of feeding value in what has generally been considered a waste product. In the manufacture of cotton seed oil, so we are told in the bulletin, one ton of seed yields 36 gallons of oil, 700 pounds of meal and 900 pounds of hulls. These hulls have, until recently, been used as a fuel. "It was noticed, however, that certain scrub stock in the neighborhood of one of the mills, managed to make a very good winter on them." This led to the suggestion that money might be made by feeding these hulls on a large scale. Accordingly, sheds, costing $10,000, were erected and 2,000 cattle were bought. The following extract, taken from the bulletin, gives an account of the methods employed as reported by the feeders:

"After coming off the cars the cattle are put in open yards for some time (about 30 days), to become accustomed to feeding and to recover from the fever of shipment, which is always present, especially in those brought from Texas. This condition is accompanied by highly colored urine. *It does not prove serious.*

The diet at the start is four pounds of meal and about 23 pounds of hulls. The regular ration later is eight pounds meal and 25 pounds hulls per diem; this is fed half morning and evening. Hay is given once a week; if manure becomes abnormally soft, the hay is increased. A constant supply of fresh well water raised by steam pumps is on hand. The water troughs are frequently cleaned of algæ which collect on the bottom and sides. Salt is always accessible. The period of feeding is about four months. About one per cent. of the cattle scour, but there is no fatality from this cause. It is attributed to the meal and not the hulls. Scouring cattle are treated by turning out of the sheds into the yard; they are given hay and less meal but the ordinary ration of hulls is continued; perfectly fresh water is supplied. The duration of scouring is one or two days. Some animals may continue quite loose in the bowels and yet gain in weight. There is no recurrence of the diarrhœa.

The cattle are released and turned into the open yards for a week or more before shipment and fed the same rations as before, in troughs. They generally under these circumstances feed at night and lie during the day. Cattle are weighed on arrival and departure. None are fed during the summer months. They sell in Chicago for full price of Texas-fed cattle of the best grade and they can pass for corn-fed steers.

There is no trouble shipping north from Texas fever regulations. They were bought by an agent in lots during the fall and winter. The best Texas cattle being purchased, average weight 850 to 950 pounds, and price, including shipment, $25 a head. These figures were rather nigh. Some cattle are obtained from this state. The weight of the cattle when shipped averaged 1,690 pounds for the largest and 1,141 for the balance. The age preferred for buying is four to six years. They are nearly all shipped to Chicago; about 280 head were sold to local butchers and buyers in Memphis. Monthly gain: those that did well were tested, some gained 20, 25 and 30 pounds a week, but they don't keep that up. Average may be placed at 75 pounds per month among good feeders. There is no refuse of food.

The yards at times get very muddy. The manure is cleaned out at times. No straw or bedding is allowed. If the cotton seed hulls are stored they sweat and spoil,and are not fit for use. They must be fresh or they will cause scouring. They will not keep stored over two months. Meal should be of a bright yellow color and free from large black particles. Hulls should not contain seeds."

The director of the Arkansas Station wisely concluded that there must have been some mistake about the weighings. The reported gains are too large. Accordingly, four animals were fed at the Station on a ration very similar to that used at Little Rock. The result, on the whole, seems to have been rather disappointing, still there is enough in it to fully justify a continuation of the experiment, which we hope will be made. The R. N.-Y. dwells at some length upon this topic because it has to do with the utilization of a waste product. Such utilization we are always very glad to assist in promoting.

TIME OF CUTTING GRASSES AND CLOVER.—Bulletin No. 5 of the University of Illinois Experiment Station discusses this much-discussed topic. Those who wish to consult a well-compiled list of analyses of grasses cut at different stages of growth will need this bulletin.

DEPARTMENT OF AGRICULTURE. REPORT FOR 1888.—This report appears to be of unusual interest. There seems to have been an effort to edit this volume and to cut out unnecessary or unimportant matter. There is plenty left that will never be read by the general public, still, it may be said that there is a distinct gain in this respect over previous reports. The volume is well departmentized, and the matter is classified and arranged so that particular topics may be readily found.

The Entomologist.—Dr. Riley gives an excellent account of the plum curculio, its life history and habits, and the methods employed in fighting it. Jarring or trapping still appear to be the only feasible remedies. The fluted scale, hop plant-louse, and other scale insects are also described. A report of the year's operations in silk culture is included in this department. We do not find much of anything in this to warrant any one in urging silk culture as a profitable enterprise for Americans. One of the most interesting papers in the entomological department of this report is the account of the California treatment for scale insects. A strong tent is placed over the tree that is to be treated and into this tent noxious gases are introduced.

Bureau of Animal Industry.—In this report Dr. Salmon gives an account of the operation of the Bureau in an effort to eradicate pleuro-pneumonia in cattle. It appears that 35,604 herds containing 305 280 cattle were inspected; 43,176 post-mortem examinations were made, revealing 3,426 diseased cattle—1,446 diseased cattle were found by inspection. The work cost, from January 1, to November 30, 1888, $481,586 55. Glanders and hog-Cholera are also discussed though little that is new concerning either disease is brought out.

The Chemist.—Analyses of a number of substances are given in this report. There is an article on Sweet Cassava, a root that promises to become quite an important product of Florida agriculture. It is valuable as a starch product or as a food for man and beast. There is also a long article on lard and its adulterations. We shall refer to this more at length at another time.

The Botanist.—Dr. George Vasey describes a number of grasses and weeds most of them natives of the West or South and some of them believed to be worthy of trial elsewhere. There is also an exhaustive article on The Pastoral Resources of Montana. This is of especial importance just now. The recent victories of the Montana-raised horse, Spokane, have caused horsemen to investigate the advantages Montana affords as a horse country. Just now, Western horses are in great favor, and it may be that Montana will be able to stamp a trademark on her horses just as Dakota has stamped one on her wheat.

The Statistician.—Mr. Dodge explains his system of collecting reliable crop reports, the value of accurate work and the difficulties met with in conducting the service. It appears that speculators frequently attempt to control the reports in their own interests. Many of the crop reporters think they ought to be paid for their services, and the work they perform is surely of great value. If the sum of $100 should be appropriated for each county, the cost would be $233,000. The service would be cheap at the price, but if there were any money in the work, a dozen cheap politicians would be after every $10 place. The result would be that some incompetent would be appointed when the service demands the best and most accurate observer in the county without regard to religion, politics, sex or age. The figures in this department are very suggestive and afford opportunity for some very interesting deductions. Some of the facts developed are quite surprising. For example, the average price for horses is highest in Rhode Island; for mules, Delaware; for milch cows, Wyoming; beef cattle, Ohio; sheep, Connecticut; and hogs, Massachusetts. The values of our imported food stuffs are just now quite freely discussed. We notice in this report that there were imported, in 1888, $20,502,223 worth of fruits and nuts. Some of our American fruit-growers argue that a high tariff should be placed on these fruits and nuts. Just now, while strawberries are barely paying the cost of picking, the streets are fairly clogged with banana stands. A high tariff would cut down the supply of bananas; this would lead to the sale of more American strawberries—thus these political economists argue. There are also in this report some interesting statistics regarding the agriculture of Egypt, Japan, Australia and France.

The Ornithologist and Mammalogist.—Dr. Merriam's report is one of the most interesting in the volume. It appears that in 1881, or thereabouts, efforts were made to introduce pheasants into the Pacific coast country. These efforts were highly successful in Oregon, but in California the success has not been remarkable. Dr. Merriam concludes that the mink does far more harm than good and should be considered as a public enemy. Mink farming used to be a profitable industry but is now little followed. Rather a good word is spoken for the sparrow-hawk, which, it is claimed, catches and kills numberless insects and mice. The crow is a bird that has been both cursed and praised by American farmers. In some localities, organized crusades are made against this black fellow, who is supposed to "pull more corn than he is worth." In other places farmers are glad to have crows about the farm, asserting that the birds destroy their weight in bugs and worms for every kernel of corn they destroy. It is also claimed that they destroy the eggs and young of poultry and wild birds and that they destroy fruits of some kinds. Dr. Merriam has made an elaborate effort to secure sound evidence as to the habits of the crow. Hundreds of reports from all over the country have been sent to him, and in addition to this, about 100 stomachs of the common crow have been examined to see what crows eat. The following verdict has been rendered: "So far as facts at present known enable a judgment to be formed, the harm which crows do appears to far outweigh the good" A bird has been found that seems to like the taste of potato beetles. This is the rose-breasted Grosbeak which eats the disgusting pest with keen relish.

Director of Experiment Stations.—Professor W. O. Atwater makes the first general report of the work done at the central office at Washington. This office was established October 1, 1888. A complete list of the stations has been prepared, a library of station publications has been started,and materials collected for an exhibit at the Paris exposition, as well as data regarding the history of the general movement for the promotion of agricultural science and education in the United States. The publication of "farmers' bulletins" is contemplated. In these bulletins it is proposed to collate the results of station work bearing upon special topics. Another set of bulletins designed more especially for those more interested in science will also be published. In fact, the central office will serve as headquarters for the whole system of experiment stations. Through this office we may expect some of the best results from the system. Accompanying Professor Atwater's report is a paper on the Origin and Development of Agricultural Experiment Stations in the United States.

SORGHUM AND IMPORTANT INJURIOUS INSECTS.—These are the subjects treated in Bulletin No. 5 of the Iowa Experiment Station. What is said about sorghum is, in the main, a review of previous work done in Kansas and New Jersey. For many years Iowa farmers have been making sorghum sirup in a small way. Chemist Patrick of the Iowa Station, evidently thinks this business can be very profitably increased. We hope so. Our sugar bill for the past 10 years amounts to $818, 644, 110.

Mr. Gillette writes about cut-worms, wire-worms and various other injurious insects. As to cut-worms Mr. Gillette tells of an Iowa farmer who catches the moths in a sorghum evaporator. The large evaporating pan, 3½x22 feet, is exposed over-night with sorghum juice in it. In the morning he skims from it one or two pailfuls of moths. This plan, he thinks, has checked the ravages of the cut-worms inside of a radius of one half a mile from his mill. A few pages of the report are devoted to remedies for cattle lice. Kerosene and lard, kerosene emulsion, pyrethrum, tobacco, and sulphur and lard all are named. Potato as an insecticide will be somewhat new to many of our readers. The water in which potatoes or potato parings had been boiled was used on lousy cattle with generally satisfactory results. Mr. Gillette also conducted some experiments with pyrethrum to see how much of its deadly effect was lost by boiling or heating. This was done to test the popular belief that a decoction of the powder is worth less than a cold mixture. Here are Mr. Gillette's conclusions—they are all somewhat at variance with previous reports.

"It seems safe to conclude, at least until more careful and exhaustive experiments prove to the contrary, that, when it is desired to use Pyrethrum in water without waiting 24 hours, it can be prepared in boiling water, (in which case I would advise boiling for five or 10 minutes) and as good results obtained as with the cold water extraction, and,second, although it is always advisable to keep the powder in tight receptacles, it does not seem possible that the powder loses its strength very rapidly when exposed to the air. The fact that when the powder is dusted on plants it soon ceases to destroy the insects that pass over it is not, it seems to me, evidence to the contrary. In such cases the finest particles of the powder,which are its most destructive parts,are soon removed by the winds and what remains becomes moistened with dews and adheres so closely to the foliage that it is not removed to come in contact with the bodies of insects in sufficient quantities to destroy life."

BOOK REVIEWS.

HOUGHTON, MIFFLIN & COMPANY, (Boston and New York), have begun the issue of a series of books under the title of "The Riverside Library for young people. It is intended to include History, Biography, Mechanics, Travel, Natural History, Adventure and kindred subjects. The books will be illustrated when necessary, and will be uniform in size, containing 200 to 250 pages each, well bound in cloth, and sold for 75 cents per volume.

We have received the first two volumes of the series. Number one is "The War for Independence," by John Fiske, a very compact, handy little volume, just the thing to slip in the pocket to be read on the cars or at odd moments. It treats quite at length of the causes of the war, and is well written and instructive. "George Washington," by Horace E Scudder, is the title of the second volume. It gives an account of the boyhood of Washington, and of the manner of life of the early settlers of Virginia. These books are of especial interest at this time.

Field Crops.

Seeding In The Corn Field.

SOWING TIMOTHY AND CLOVER AT THE LAST CULTIVATION OF CORN.

WOULD IT ANSWER?

DODGING DROUGTH.

THE following questions were sent us last May. The answers form an interesting study of a somewhat new idea in farming.

W. O. F., Greensburg, Indiana.—What would be the result of sowing a mixture of Timothy and clover in July in corn ground at the time of the last plowing of the corn; the ground to be in the best tilth, and free from weeds? Under the protection of the corn would both the clover and Timothy get such a start as to be able to withstand any ordinary winter? Would the growth make good meadow or pasture land for the next year?

We are having a very severe drought which has already destroyed about all the spring-sown grass and clover and has very materially injured the wheat, oats and meadows. Would additional grasses make a better meadow or pasture than those mentioned above?

FROM PROFESSOR G. E. MORROW.

The plan of sowing Timothy and clover in corn ground at the time of the last cultivation in July, the land being clean and in good condition, would probably give fairly satisfactory results. This is about the time at which Nature sows Timothy seed—clover seed a little later. There are objections to the plan, however. I would prefer cutting the corn early and sowing the land to rye, sowing the Timothy seed at the same time, putting on the clover seed in late winter or very early spring, rolling the land in the spring. I decidedly prefer rye for this purpose to wheat or oats. With a fairly favorable fall and spring, the rye gives much good pasture and also a fair yield of grain. The plants sufficiently shade the ground without "smothering" the young grass or clover. The crop is cut before the hottest season, and is usually cut high enough so that the stubbles afford some protection to the grass. If one could be sure of a favorable autumn, I believe it would be safe to sow clover seed by September 1; but in case of dry weather preventing prompt germination, the young plants would probably be winter-killed.

University of Illinois.

FROM J. C. STRIBLING.

The best catch of clover and Blue grass I remember was sown on top of land after sowing cow-peas in August. The peas grew off rapidly, shading the ground well, and the September rains brought up a fine stand of clover and Blue grass, which looked rather "leggy" and feeble from the shading of the crop of pea-vines until frost came in October, at which time the young pea-vines were all killed and laid flat, thus making the best possible mulch—evenly distributed—which gave good protection to clover and grass during winter and served to shade the land and retain moisture the following spring and summer. The decoction brought out by the rains falling on the tender, frosted pea-vines, seemed to act like a charm on the young clover and grass which changed from pale green to dark green and from a feeble to a vigorous growth. I have not tried Timothy or clover sown among growing corn, but I see no reason why either would not do as well as wheat or oats sown in the same way. Oats are largely sown here among growing cotton in July and August.

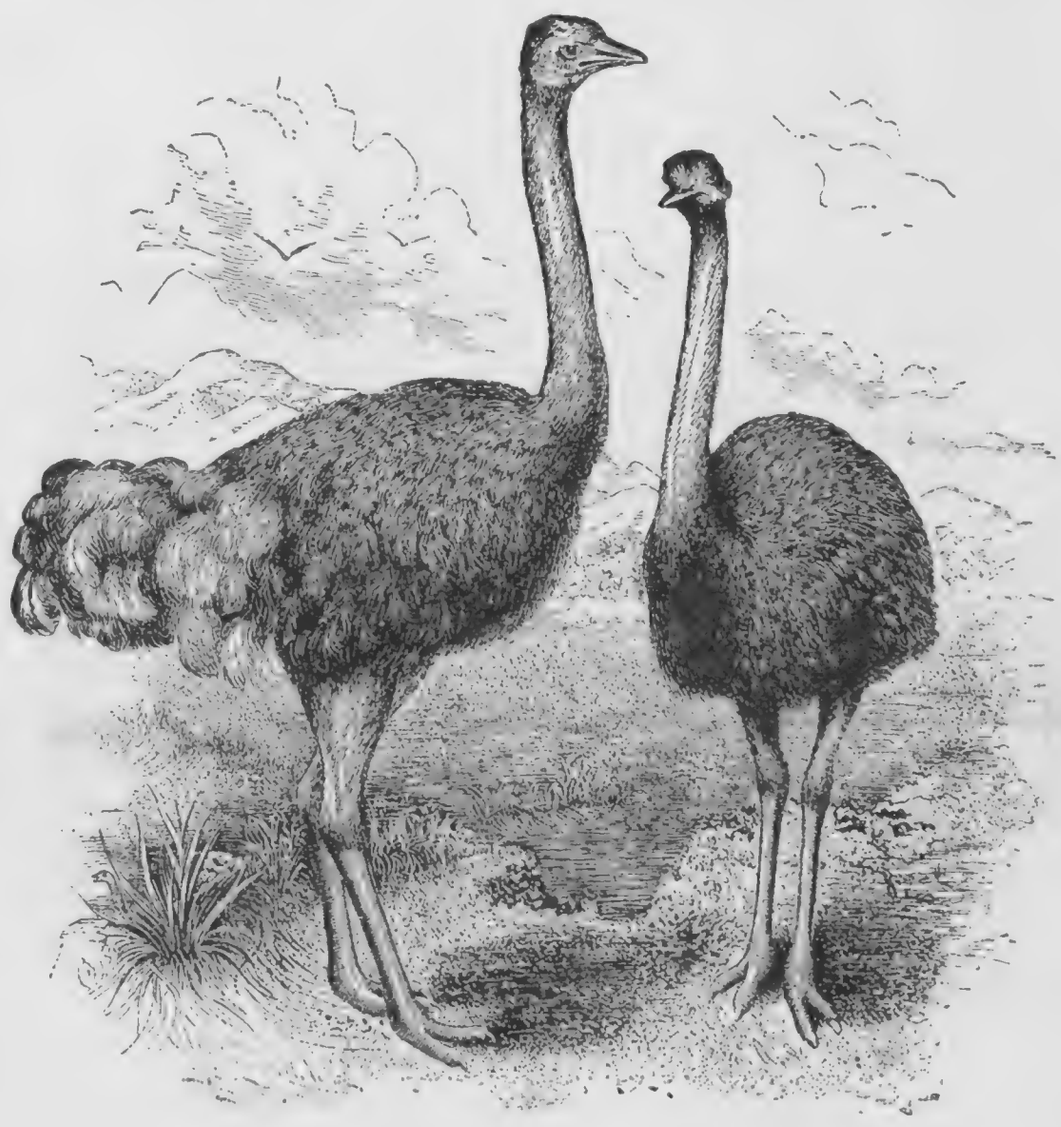
Pendleton, S. C.

FROM E. DAVENPORT.

Although I have never practiced this plan I should expect it to succeed. The Timothy certainly would thrive and the clover would be altogether likely to do so. With us both are occasionally sown with wheat, and Timothy is usually started in that way. True, clover does not always endure the winter when started so late, but I think the correspondent need have little fear of failure from the plan proposed. I should expect most grasses to succeed under such circumstances, and that a good yield of hay could be cut the next season; though I should not like to pasture it until late, provided at least, I expected to make a meadow of it, as pasturing is severe on young plants not fully established. I would be understood as giving this as my belief in the matter; I may not be correct. Our excellent authority on grasses, Dr. Beal, gives it as his opinion that it would be likely to succeed. There is little doubt about the clover, and less about the Timothy. I believe the correspondent will be warranted in giving it a careful trial on a moderate scale.

FROM PROF. W. C. LATTA.

With such a season as we have had for two years, one would probably fail to get a "catch" of clover in the corn. When the weather in July, August and September, is so dry as to kill out the spring sowing of grass, it seems to me that there is small chance for a catch late in June or early in July. Grass (clover) has been sown in this way, however, and with success in some cases. If pasture is wanted (and I judge it is, for the corn ground would make a very uneven meadow), I would



PAIR OF CAPE TOWN OSTRICHES. Fig 159.

sow clover and Orchard grass rather than Timothy and clover. With favorable weather in July and August the seeding would doubtless do well. Much would depend on these two months I think. As to the ability to stand the winter, I would say this is of secondary importance. If land is "heavy" (disposed to heave) and the winter unfavorable, either spring or summer-sown clover would be seriously damaged. With favorable weather in summer (which we can't certainly count on) the summer seeding would stand a good chance to get through the winter.

Purdue University, Ind.

FROM PROFESSOR H. H. WING.

It does not seem to me that it would be advisable to sow the seed in the corn if the land were intended to be used as a meadow, because of the rough condition in which the land is left after corn. But for land intended for pasture I can see no objections, under the conditions named, to sowing Timothy and clover in the corn at the time of the last working. Care should be taken to time the seeding after a light rain or when the soil is otherwise moist so that germination may be early and vigorous. Clover seed so sown should make sufficient growth to carry it nicely through the winter and furnish a fair crop the next year. I should recommend six pounds of Timothy, four pounds of Medium clover, one pound of Large clover, and one pound of Alsike per acre.

Cornell University, Ithaca, N. Y.

FROM HENRY STEWART.

The practice of sowing grass seed in corn ground is a bad one unless the conditions are such that it is better than having no grass at all. I have sown land in this way and had good grass following, but never good enough for pasture or mowing the first year. The time is wholly too late for clover, as the growth is slow and it is not sufficiently strong to withstand the winter. I have sown rye on the land before the last working, and a common cultivator or Planet Junior horse-hoe following will cover the seed perfectly. Immediately after the cultivator Timothy or Orchard grass is sown. I prefer the latter for pasture, as it comes much earlier than the Timothy. I have used a small V-shaped, sloping-tooth harrow for this work, which has done very well on land that is mellow and clean. The clover seed is sown in the spring, taking advantage of a time when the ground is cracked and opened by a frost.

The "protection" of the corn is not such as will help the growth of grass and clover under any circumstances, as the shade is too dense, and this practice is only justifiable as a makeshift to get something out of the land, when a regular rotation cannot be followed. I have a large field now in grass and clover sown in this way on corn the year before last. Rye was sown in July and Timothy immediately afterwards. Pea-vine or Perennial clover was sown in March of last year. I got about 10 bushels of rye per acre and a large quantity of straw, and the grass and clover made an excellent catch promising a good crop the present year but for the very dry weather and cold northwest winds. My principal purpose is finally to plow in the clover to improve the land after getting a crop of hay this year, and some fall pasture if it should be needed Under such circumstances as this, where the land needs this kind of help, and manure is not available, I consider this a legitimate practice, on the principle of "half a loaf is better than no bread;" but I would not do it or recommend it under other circumstances, believing, and I may justly say knowing, that if the land is well prepared for oats and after the oats are sown, the grass and clover seed are harrowed in with a light sloping-tooth harrow, or even covered by the use of a plank smoothing drag, dry weather will not materially injure the seeding, although it may be quite sufficient to destroy surface-sown seed without any covering by the harrow. For several years past I have not missed a grass or clover seeding made in this way.

Macon County, N. C.

FROM. S. B. HOEFGEN.

In a talk with a neighboring farmer on the above queries, he said he had no doubt that the crop would do well. He had known of clover being sown in corn at the last plowing that did well, and Timothy no doubt would do equally well, because we sometimes let the Timothy get ripe to get a better stand on a meadow that is too thin, and we generally have a thick-set meadow the next year. He said the reason why we do so little grass seeding in corn, is because we generally prefer to put wheat in the corn and sow the clover on the wheat the following spring. Another farmer told me he had sown clover three times in corn and it did well each time. His reason for sowing in the corn was that the ground was too full of stumps to sow to wheat. He seeded as fast as he plowed, but I would prefer to follow after seeding the clover with a light harrow or drag, because when I sow turnips in corn and harrow in the seed I generally succeed in getting a good stand.

If I do not harrow I fail, unless a heavy rain follows immediately after seeding and there are several days of damp and rainy or cloudy weather. As to making a crop the following year, there can hardly be a question. I think the RURAL has published statements from correspondents who have recommended the sowing of Timothy alone in the fall, because it would give a full crop of grass the following year.

Crawfordsville, Ind.

FROM C. S. PAINE.

I have no hesitation in saying that this plan will pay. I stocked a number of acres last year, sowing the Timothy and clover mixed, going through every row. The grass is now in a splendid condition; a good swath might be cut, and I shall get two crops of from three to four tons to the acre. The clover will not winter-kill in this climate as a general thing, even if sown as late as August 1, and the Timothy is sure to come out right in the spring if sown later. Last year I sowed a mixture of four kinds, viz, Red-top, ordinary clover, Alsike and Mammoth clover, and all kinds are doing well. Care should be taken to have the land as level as possible. A mowing machine will cut the old corn stubble without any trouble. A very dry season at the time of sowing the seed and a long-continued drought may cause a failure on dry land, but I have not failed on that account and I have practiced that plan for 15 years or more, and many of my neighbors practice it, all with good results. It is often the case that where the corn stands in stooks on the ground for a long time, the grass will be smothered out where the stooks stand. The new grass in the fall will present a beautiful green appearance after the corn is removed.

South Randolph, Vermont.

FROM T. B. TERRY.

If there were plenty of rain the Timothy and clover might both do well, in this latitude; but if there were not, the clover would probably not make growth enough to stand the winter, although the Timothy might come on in the fall and do well. Then there would be the objection of pretty rough ground for mowing the next year. Taking it all together, I would not favor the plan. Spring-sown clover is never killed by drought here, if sown early enough. At least I have sown very early for 20 years and never once failed. Seed sown in April frequently fails. It must be sown early enough to get a good start before the spring moisture is gone. Timothy seed sown about the first of September rarely fails here, if the work is properly done. I sow mine in the spring with the clover, however, as otherwise the clover would be sown on a Timothy sod, and stand but little chance. Thousands of bushels of clover seed are wasted in this way; but still it is the general practice here to sow Timothy with wheat in the fall, and the clover in the spring on the ground already occupied with wheat and Timothy. Then the farmers wonder why they do not get more clover. What chance do they give it?

The writer plowed under a quarter of an acre of strawberry bed last year in July. In August I sowed Timothy and clover seed, during a wet spell. Both came up and grew finely; but this spring it was a very heavy Timothy sod, and not many clover plants were to be seen. Although there are exceptions, I think the rule is that spring is the best time to sow clover seed, and fall the best time to sow Timothy, that is, as far as the good of the Timothy itself is concerned. With me clover must have the best chance it can. Clover we must have and what little Timothy we can get in with it is all right. The latter being the more feeble grower, in its infancy, the clover if given an even start will take the lead and keep it, letting the Timothy have full sway only in spots where for some reason clover does not thrive well.

Summit County, Ohio.

BUCKWHEAT.

BUCKWHEAT is a crop most in favor in regions where the soil is light, the country hilly, and the climate cool, without too early frosts. On soils that are too rich, there is usally such a rank growth of straw that the crop falls down before it is ripe, and does not fill well, sometimes not yielding any grain at all. It naturally belongs to the cooler and rougher regions with hill-sides and thin soils; it does not follow, however, that it cannot be profitably

raised on level land and better soils. In fact much of the buckwheat raised in New York and Pennsylvania is produced on level land good enough for wheat. It is usually sown on light soils for the very good reason that such soils will produce a paying crop of buckwheat when too poor to produce anything else. The varieties chiefly grown are the Gray, or Silver Hull, and the Black. The Gray is the general favorite and is the kind mostly used. The Tartarian, or "Rough," is not much grown except for feed, as the flour is of a dark yellow color and slightly bitter to the taste. It out-yields the other varieties, is hardier and can be raised farther north. I have not had any experience with the Japan buckwheat, but the farmers in this locality who have tried it, speak very highly in its favor. The center of production in the United States lies further north than that of any of our other cereals. Three-fifths of the crop grows between latitudes 41° and 43°. The 42nd parallel is about the center, and 41½ degree north latitude is about the southern limit of the district. Its northern limit is bounded only by the region of early frost and extends some seasons far up into Vermont, Northern Michigan, and Wisconsin.

There is no doubt that, like all other plants, buckwheat will do the best where the ground is well plowed and made fine with the harrow; but if the plowing is poorly performed and the ground cloddy and lumpy—which is frequently the case when the field is baked hard by drought at the time the plowing must be done—it will still try to make the best of the situation and exert itself to pulverize the soil and produce a crop in spite of the adverse circumstances.

Along the river in this region, it is usually sown from the first to the tenth of July. Back from the river, where the fog does not keep off the frost, it is sown in the latter part of June. The later it can be sown and get ripe before frost, the better will be the yield. A neighbor told me that the heaviest he ever raised was sown on the first of August; but the frosts held off unusually well that fall; and as such seasons cannot be expected often, the crop should always be put in earlier.

There is one objection to raising buckwheat—it does not seem to fit well into any regular rotation, and for this reason I have known farmers to sow the same field with buckwheat five or six years in succession and have a tolerably fair crop the last time. Some sow buckwheat ground with oats the following spring, but the scattered buckwheat on the ground will come up in considerable quantities and grow along with the oats, and although it does not injure the crop for the farmer's own use, it lessens its value for market. I have raised good crops of rye sown after buckwheat came off in the fall, although it was necessarily sown late, and then by seeding with clover in the spring, I obtain a better catch than if the rye had obtained a large growth in the fall. I plowed the ground after the buckwheat was harvested, but this was hardly necessary, for the plants furnish such a dense shade, and the roots pulverize the ground so well that it is left in a very mellow condition, and I have frequently known farmers to sow rye on their buckwheat stubble, and, by harrowing it well, get a good crop. Dry weather and hot sunshine when the kernels are forming are usually the causes of light crops. The hot sun at that particular time is said to "blast" the buckwheat. I suppose that when the kernel is in process of formation, and the shuck very thin and transparent, the heat of the sun, if great, drives out or evaporates the moisture in the incipient kernel, and causes it to wither and shrivel.

About one bushel of seed is usually sown per acre in this section, although on good land three pecks are sufficient, the thinner seeding producing a heavier, stronger straw, less likely to lodge. Buckwheat does not tiller out at the root like wheat and rye; it sends up a single stem which, if not crowded, branches out like an apple tree. If sown thickly, of course, it will not branch out much, and the straw will be finer and weaker. Buckwheat is quickly grown, requiring but about three months of summer; it costs much less labor to produce it, and pays the farmer sooner on his investment than any other grain. It will grow on poorer land and with more careless husbandry, although it responds with alacrity to better soil and more generous treatment. It is always in good demand as soon as thrashed, sells readily for cash, and the first sales are usually the best. It should never be held for a higher price except perhaps to sell for seed the following spring when it is sometimes scarce. The demand for buckwheat flour always falls off in the cities after the holidays, and millers will not usually pay as much for buckwheat after that time.

It was estimated by a miller who is well informed, that in the year 1888, Bradford County, Pa., produced a round million of bushels of buckwheat; that about one-third of the crop was consumed at home and the remainder converted into flour and sold in New York, Philadelphia, and the towns in Southern and Eastern Pennsylvania. It is the only kind of grain raised in the East in which the farmers have not suffered a ruinous competition from the great, fertile, grain-growing plains of the West. Instead of being a competitor for the buckwheat markets of the East, the West furnishes us with a good and growing market. The mill at Sugar Run has sold a good deal of flour to go 40 miles west of Chicago, and has also had orders from Kansas. Sheep will eat a little buckwheat straw if it has been saved in good condition, but it is not considered of any value except for manure, and I am sorry to say that the straw when thrashed in the field is frequently burned as soon as the machine is out of the way

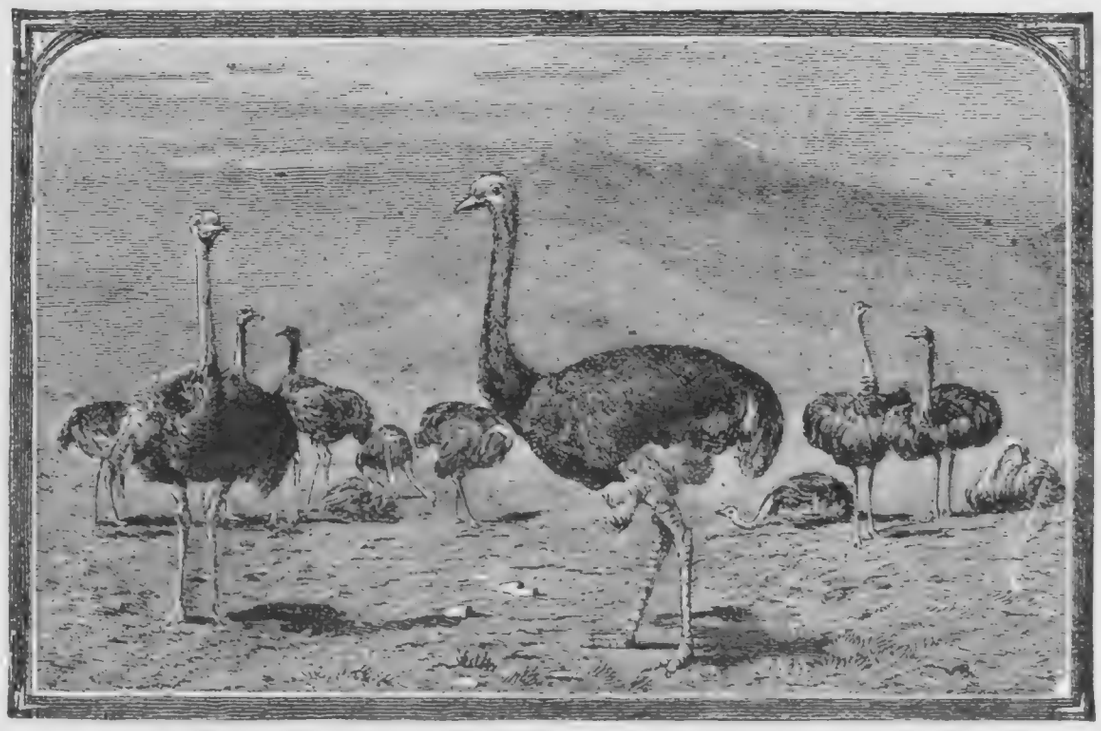
Sugar Run, Pa. J. W. I.

The Poultry Yard.

OSTRICH FARMING IN AMERICA.

In the last report of the Department of Agriculture we find a long article on the above topic. The pictures shown in this issue of the R. N.-Y. are re-engraved from this report.

It appears that ostrich farming is one of the largest and most profitable industries of South Africa. The annual exportation of feathers from that country amounts to millions of dollars, while first-class breeding birds have been sold for over $1,000 per pair.



GROUP OF CALIFORNIA OSTRICHES Fig. 160.

General Le Duc, while Commissioner of Agriculture, tried to interest our Government in a scheme of importing ostriches with a view to establishing the business of ostrich farming in Southern California. Nothing came of this, but in 1882 Dr. Charles J. Sketchly, who had handled ostriches in Cape Town, came to this country with 200 birds. They came to New York and were shipped overland to California. This long journey was a most trying one and but 23 of the birds survived it. They were taken to Anaheim, in Southern California, and placed on a farm. The first year they laid 270 eggs. The first chick was hatched July 28, 1883. The next lot of imported ostriches, 23 in number, reached New Orleans in December, 1884, and were taken to San Diego, California. Since that time several importations have been made, though the Cape Town Government became alarmed at the large exportation and imposed an export duty of $500 on each bird taken out of the country, this duty making the cost of bringing an ostrich to America nearly $1,000.

The first ostriches brought to this country were considerably weakened and impaired in vigor by the journey. The American-raised birds are said to be stronger and give fair results. From the best information we can obtain, the ostrich farms in California promise to pay a small profit eventually. The great cost of the early importations and the difficulties attending the acclimating of the birds made the early part of the work very expensive. A more thorough study of the habits and needs of the birds will result in better appliances and methods. There is enough in the business to warrant the Government in establishing experiment farms in the dry, hot regions of the far Southwest where ostriches may be kept. We spend millions for ostrich plumes. If these could be produced on the waste lands of the desert there would be a double gain.

At Figure 159 we show a pair of ostriches brought from Cape Town to California to serve as breeders. Figure 160 shows a group of ostriches that were raised in California; they are one year old and over. Figure 161 shows a group of ostrich chicks two weeks old with the dog that watches them. In the picture we have two ostrich eggs with a hen's egg between them to show the comparative size. Figure 162 shows the incubator used in hatching the chicks.

On the California farms each breeding pair is confined in a small pen until the eggs are laid. The younger birds run in large inclosures, while the chicks run with the common barn-yard fowls. The little chicks are delicate and cannot stand the damp. The ostrich lays an egg every third day. The eggs are five to six inches in diameter and weigh three to five pounds each. The shell is often one-sixteenth of an inch thick, and it is generally necessary to assist the chick in breaking it. The average period of incubation is 39 days. The birds are not good mothers, leaving the eggs on slight provocation. The male bird takes his turn at sitting on the eggs, generally staying on them 19 hours out of 24. So much difficulty was experienced with hatching in the usual way that ostrich farmers have adopted the incubator, shown at Fig. 162, exclusively. The flesh of the ostrich is considered a great delicacy in Africa while the eggs are fully equal in flavor to those of the hen.

KANSAS POULTRY NOTES.

Raising poultry on the ordinary farm in Kansas, is, I suppose, not very different from doing so in the majority of the older States, especially those of the South. Here as well as there with trees, sheds, or fences for roosts and the high heavens for shelter the birds never lack fresh air. If they were as well supplied with drinking water as pure, fewer would die from "cholera" or other diseases. But too many are supplied with no water at all and whatever they find to drink they drink from necessity many times rather than from choice, be it from a barnyard pool, hog trough, or a stream. Where many fowls are devoured by the swine the latter seem to crave for the feathered prey, evenw hen they have all the corn they can eat. Whether this appetite is caused by a too steady diet of corn, I have not been able to learn; but when a hog once acquires this habit, I have never heard of its abandoning it entirely. Fowls, as a rule, are never out of food, if a corn crop is raised; for they can have free access to that and to everything on the farm to the detriment of the profit from them in eggs. Nearly every farmer has from 75 to 150 fowls; but few get more eggs than they ought to get from 25 good laying hens. Many, however, think this number quite reasonable for they have grown up amid slipshod, careless management of poultry and of every other branch of farming. Some years I have heard of whole flocks of poultry dying from cholera. For this the best remedy I have found is carbolic acid. I put about one teaspoonful into a pailful of water, stirring it around, and set it wherever the fowls can all drink. Doing so two or three times will be sufficient. I think some breeds much more subject to disease than others. The three breeds of chicks I have raised, viz., Black Spanish, Plymouth Rocks, and Dark Brahmas, range in hardiness in the order named; I have lost 10 of the last to one of the first by disease. During a sudden blizzard before the fowls had all become accustomed to their winter-quarters two years ago, all of my Dark Brahmas that were caught in the snow died, but the Spanish lived. While the Spanish are so hardy, their feathering out in the fall is a great objection to them, but their excellent laying qualities as well as the great size of their eggs commend them. At our common country groceries eggs are sold at from five to 12 cents per dozen in summer, and in winter at from 15 to 25 cents. Some pack them down in salt after the hot weather of summer has past, and keep them for higher prices in winter.

Greenwood County, Kan.

The Apiarian.

A STUDY IN REPRODUCTION.

PROFESSOR A. J. COOK.

Excellent new works in apiculture; influence of previous impregnation on subsequent progeny strongly controverted with regard to bees and poultry, and very doubtful with regard to mammalia—an interesting discussion.

Bee literature has made very substantial progress during this year. A few weeks since that immortal classic "Langstroth on the Honey Bee" came forth from the hands of two of America's most able bee keepers Chas. Dadant & Son, fully revised and embracing not only all that was admirable in the old work, but the very best of science and practice as developed in Europe and America during the last two decades, during which the progress made in apiculture has rarely been excelled by that made in any other art. This new work confers great credit on American literature, and should be in the hands of every bee-keeper in the land. More recently G. M. Doolittle, one of our most able and successful bee-keepers, has issued a work on "Queen Rearing," which is doubtless the best work on this subject, ever issued in the English or any other language.

In this work Mr. Doolittle asserts, as the result of his wide experience and observation, that if queens are impurely mated, their drone progeny will be impure even though the queen bears no taint in her blood. Akin to this theory is that held by some of our chicken fanciers, that if a hen of some distinct breed is mated with a cock of another breed or with a mongrel, this hen will be ever afterward impure. Analogous to this is the view often urged by breeders, that if any of our purely bred mammalia—hogs, sheep, cattle or horses—are impurely mated, they will be ever afterward impure; and so their subsequent offspring will very likely show taint, even though the male parent is of faultless breeding and of the same blood as the female.

I do not feel that I can deny the truth of any of these views: but I can ask, very properly, if we know that any of them is positively true. I must say that I have grave doubts in the matter.

In case of bees, the only possible chances for the queen to be tainted is for her organism to be affected by the mere presence of the sperm cells in her spermatheca. As is well known, the egg of a queen bee that develops into a drone is never impregnated. Then if a pure queen produces a hybrid drone, it can only be because her organization is affected by the mere presence of spermatozoa in her sperm sack. I know the reproductive organism is very sensitive and that the sperm cells may be in the spermatheca of the queen five years; but as these cells remain unchanged, I see not how they can affect the queen. Even suppose some were absorbed, they must be changed before this absorption, and in the blood would be like any other digested fluid. Thus from our knowledge of physiology we should doubt this theory.

But I have other reasons for doubt. When Mr. Jones first imported Syrian queens I got one, especially to test this theory. I had only Italian bees in my apiary, so the many queens I reared from this pure Syrian were all mated to Italian drones. There was no possible chance for an error, yet all the drone progeny from the mis-mated queens was entirely like the Syrian drones—not a trace was there of Italian. The Syrian drones are very marked in their characteristics and so, as this test was so extensive—there being thousands of these drones—and as I had many sharp eyes looking for Italian marks, I feel very certain that Mr. Doolittle is wrong.

But what of Mr. Doolittle's experiments that have led him to a contrary opinion? I simply think his queens were not pure. In my case there was no chance for error to creep in. In his I can't see how he can be certain. I doubt if there is a man in the United States who has an Italian queen that

he knows is absolutely pure. He may be very sure, but absolute knowledge in such cases is hard to gain. I have great confidence in Mr. Doolittle's ability, honesty and observation, but I believe in this he is mistaken.

In case of fowls, the opportunity for taint is still less. It can come only from the presence of sperm cells in the oviducts for a few days. The sperm cells enter the egg after which the latter has no organic connection with the hen. I have also tested this matter on a large scale; and am fully persuaded that the theory is in doubt. I bred chickens from Leghorn and Brahma hens that had freely mated, the first year with Brahma cocks, and the second with Leghorn, for months, yet not a chicken, of scores reared from purely mated hens after three weeks removal from the other cocks, showed a trace of impurity. When people find it otherwise, I believe either their hens or cocks are not pure.

In case of mammalia the case is somewhat different. Here the sperm cells are not only in the reproductive tubes of the female for some days; but there is, through the placenta, organic connection between the fetus and mother all through gestation. And, possibly, through cell inoculation the sensitive ovaries may become so affected that subsequent eggs will show a taint of blood. I must say, however, that I am skeptical here. The placenta, in the uterus, is some distance from the ovaries, and the organic connection, which is only membranous, exists but for a short time. I can hardly see how the mother could be affected. I think we need more light on this problem. A very extensive and intelligent breeder of mules tells me that he knows there is no truth in this theory. He has raised many colts from mares which had previously bred mules, and these colts were all horse.

Dairy Husbandry.

DAIRY DOTS ON THE RURAL NO. 2,055.

A. L. CROSBY.

AN "ALL-PURPOSE" SYMPOSIUM.—Well, the Holstein men have had their say in the RURAL, and they seem to agree that a big cow with a beef tendency is the profitable all-purpose animal. Very well, but to be convincing, figures ought to have been given showing the cost of feeding a big cow for a year and the amount of milk and butter she gave in return. One of the Holstein cows, figure 150, attained the enormous weight of 2,030 pounds, From my experience in feeding cattle for beef, I know that an animal so heavy as that must consume a large ration merely to sustain life, then, in addition, the profit ration must be given. If it pays, all right; if it does not pay, all wrong.

It is rather singular that Holstein breeders —taking into consideration their claims for butter—have given numerous yearly milk records, but, as I remember, not a single yearly butter record. They have "estimated" the butter yield from weekly tests, but that is not the right way. Let us have the whole year. Now if the Holstein is the cow that farmers want, it is easy to show it by giving the figures, the actual cost and yield.

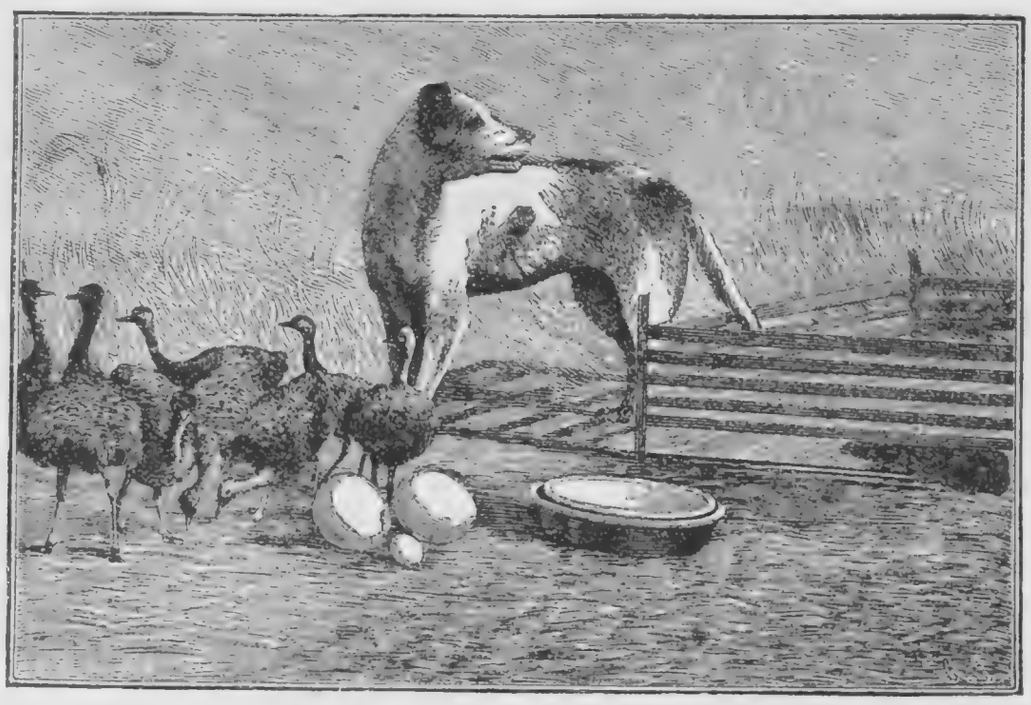
THE BEST CHURN.—P. B. S., inquires on page 398: "Why is not that the best churn which will make most butter of at least equally good quality, from the same quantity of cream?" It is, providing it does not consume too much time in churning or cleaning the churn afterwards. The churn with a dash in it will not injure the grain of the butter if it be stopped when the butter is in the granular state; but the dash will not bring the butter any quicker; it is unhandy to have and to clean and as it has no useful part to perform, why not leave it out?

In the table P. B. S. gives of the results of the churn contest, the Blanchard, a dash churn, made the most butter from a given amount of cream. Was the butter analyzed and the per cent. of water in each lot determined! If not, then the trial proves nothing so far as the quantity of butter is concerned as in 40-pound lots, one lot could easily contain a pound or two of water more than another. In churning by concussion the whole mass of cream is evenly churned; but if a dash is used. a coating of cream is formed over the whole inside of the churn, which is not reached by the dash and is not so sure of being all churned. If the dash churn will make better butter, make it with less labor, make more of it and make it quicker than any other churn, why, that is the churn we want. But if it won't, then let us swing our cream or turn it end over end.

KEEPING BUTTER.—Col. Curtis says on page 399, that in packing butter to kee for winter use: "The butter milk should be well worked out.' This must be a misprint for "washed" out, as I don't believe the Col. would advise gathering the butter in the churn and then attempting to work out the butter-milk. The Colonel writes an "awful" hand and it is no wonder the printers make errors in setting it up.

SOILING COWS.—Henry Stewart says on page 399: "The great advantage of soiling cattle is that it is exceedingly comfortable for the cows, insuring full feeding with the best food, the largest supply of the best milk, and the ease and comfort of the owner." How differently we look at things! I think the great disadvantage of soiling cows is that it is exceedingly uncomfortable for the cows, with no guarantee of full feeding unless much more than they can eat is given them, so that they can pick out the best; the grass—if grass is fed—must be of a certain hight in order to be cut, whereas, in the field the cows reject the long grass and eat the short, fine grass that the scythe would not cut unless it had a lawn-cutting edge, which it never has. It is very uncomfortable for the owner to cut it in a pouring rain or a scorching sun, especially on Sundays. It takes much valuable time, and if the field is properly pastured, does not save grass enough to pay for the worry.

As for there being no "driving of the cows," there need be none in pasturing. What's the matter with "calling" the cows? The dairyman who can't go to the gate of the pasture field and let his voice leak out in a long "Hoo-oo-oo-o-o," with the immediate effect of causing each cow to raise her head and listen, then, at the next call, give an answering "Moo-oo-oo-o," with a move in the direction of the caller, both then marching straight to the stable; I say the man who can't do this has not got as well acquainted with his cows as he should be. But if we must soil, let's do it with the help of the silo. Then things will move along with the ease and comfort—both to the cows and owner—that Mr. Stewart describes.



OSTRICH CHICKS AND EGGS AND KEEPER'S DOG Fig. 161.

Everywhere.

THE CASH CROPS.

(CONTINUED.

Kansas.

WASHINGTON, Washington County, June 6.—Our money products are hogs and corn. We sell them right here to grain men and hog buyers. Prices have been fair; but are lower now. Hogs are sold by weight, all at about the same price. Corn must grade No. 2 to bring market price; when it is damp or damaged it brings less. Time was when there was a profit in growing and feeding cattle. There is no range here now, and cattle feeding for the past two years has been at a loss to the feeder. Unless there is a change in prices, this section will undoubtedly settle down almost entirely to hogs and corn, and at the present rate of transportation there will be little or no money in corn. In improvements I could suggest a good many changes and not the least would be the appointing of a competent general agent, under heavy bonds for each township, not only to buy and sell everything; but to have the general oversight and management of all farms, giving directions as to what and how much shall be grown and the amount of labor imperatively demanded, and as to every detail in the raising of stock. He should see that every house is painted and that the grounds are suitably adorned with trees and shrubs. This would probably revolutionize and brighten the prospects of every neighborhood. F. O. C

Michigan.

MENOMENEE, Menomenee County, June 11. —1. Hay and potatoes are our cash products.

2. They are sold in the county where they are produced, and they are sold in the city to consumers.

2. Prices have been very low—too low for a profit, owing to over-production Prospects very poor.

4. Some get extra prices by marketing only first-class goods.

5. For 10 years farming has been going from bad to worse. Cash crops have not changed.

By way of improvement I would suggest that the farmers should cultivate fewer acres and do the work better than they do it now. They should also keep a milk and butter record for their cows and then they would know the difference between good and poor stock. I would also suggest that they should feed their cows well and keep fewer. By so doing they would save labor; get more money for the labor performed, and have better manure to spread on the land, and consequently better crops. They should also plant sweet corn to feed to their cows in July and August. No money can be made or saved by starving them. I would sell no hay if I had a home market for the butter and at satisfactory prices. M. M.

ROLLIN, Lenawee County, June 9.—Our money products are pork, wool and wheat, poultry, beef, butter, cream, potatoes, oats and corn. These are sold to middlemen in the nearest village, except eggs, poultry and cream, which are taken right from the farms. Prices have been fair, though our products have been occasionally sold below cost. Prices in future will probably be like those in the past. If some one makes more money than his neighbors by raising any particular article, all are likely to go to raising it until the market is glutted and they have lost more than they have made. J. O. B.

New York.

LYONS, Wayne County, June 11.—Barley, wheat, corn, potatoes, apples, peppermint, oats and hay are our cash crops. They are sold in this place to shippers. Considerable hay is also sold and it pays well at present; but if all goes out and nothing is put back, crops must shortly be greatly reduced. More stock and silage are needed to keep up the fertility of the soil. Our facilities for shipping are good, by canal or railroad. Prices are: Barley, 55 cents to 80 cents; wheat, 80 and 90 cents paid by millers and shippers; potatoes, 25 and 35 cents; oats, 27 to 40 cents, according to the kind and quality. Hay brings us from $10 to $15 per ton; apples, from $1 to $2.25 per barrel according to quality and kind. Several changes have been made within 10 years owing to the use of better machinery so that grain goes on in better shape. Then we have better facilities for making good butter, and people take more care to look up good customers who appreciate a good thing when they get it. Then ensilage, too, has come into pretty general use inside a decade. As improvements I would suggest the making of more barnyard and stable manure, and the cultivation of fewer acres with greater care. J. B.

Ohio.

NAPOLEON, Henry County, June 10.—Wheat, corn and rye are the crops from which farmers hereabouts obtain their money. They are sold to local dealers in the nearest towns. Prices for 10 years past have been lower than formerly, and we can see no prospect of an improvement in the near future. I have no knowledge of any farmers who realize more for their products than market prices. There has been little change in the past 10 years Farmers now depend for their cash upon the same crops as formerly. I would suggest the keeping of better stock of all kinds, the production of more feed and, its consumption on the farm by improved stock, and the selling of condensed products in the form of mature horses, cattle, sheep, swine or wool; or highly bred stock of any kind for breeding purposes. V. J. E.

TIFFIN, Seneca County, June 10.—The people of this neighborhood depend mostly on wheat and corn as their main crops. Corn is mostly fed to hogs and cattle, and wheat is sold right after it has been thrashed or when the price is satisfactory or when the farmers are obliged to sell. Most of the wheat is sold to shippers, and shipped to New York City, and some is sold direct to steam mills in this place. Wheat has averaged about 85 cents per bushel during the past few years. If farmers would read the RURAL NEW-YORKER and take the best out of it, there would be a bright future ahead, but with some of them there is quite a dark future. There are few who try to double their crops. Farming has not changed much in the last 10 years. By way of improvement I would suggest that farmers should raise more on one acre than they now do on two, that they should raise 500 bushels of potatoes per acre instead of raising from 75 to 100 bushels as they do now. Besides wheat and corn, farmers raise different kinds of crops in this neighborhood, such as oats, potatoes and considerable hay, which is mostly fed to stock. Seneca county is also one of the best fruit counties in the State; but the crop for this year is almost a total failure, except grapes. P. H. B.

Wisconsin.

KETCHAM, Fond du Lac County, June 3.—We are having a trying time here just now, there having been three heavy frosts within 10 days—two white and one black—followed now by one week of rain and very cold northeast winds with some snow on June 1st. The mercury was down to 44 degrees at noon. No change to-day. Corn looks as if it could not recover. Potatoes are black to the ground. The Rural No. 2 came up well; but was killed. The vines on my Contest plot are black to the ground. Grass and small grains doing well. H. D. P.

THE FARMER'S CLUB.

ANSWERS TO CORRESPONDENTS

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

WHEAT QUERIES.

D. R., Bergen County, N. J.—1. If you suspect wheat is going to lodge, what can be done to prevent it? 2. How well does wheat or rye ripen when lodged? 3. Is it economical to have the field so well manured as to endanger lodging? 4. Which will stand up better bearded or beardless wheat?

ANS.—From its own experience the R. N.-Y. can give but little information. The following answers are from successful wheat growers.

FROM A. L. CROSBY.

1. I know of nothing that will do so on my soil; on some soils salt is said to stiffen the straw.

2. If the grain is formed and in the milk, or nearly so, I think it will ripen well; but if the wheat lodges much before that time the chances are for light grain or none.

3 Well, yes, I think I would run "some" risk that way on account of the grass and clover. But a lodged wheat field is a poor piece of property.

4. In my experience the beardless is much better. After the recent storms both of my wheat fields were down, but soon got up as straight as ever with the exception of a little patch on well manured potato ground. My wheat is Fultz. If it were a bearded wheat,

much of it I think would have staid down.

Baltimore County, Md.

FROM E. DAVENPORT.

1. My knowledge of the causes and remedies for the lodging of grain is exceeding limited. It is usually caused by, or rather is associated with a deficiency in the formation of woody matter and the fibrous bundles of the stem, leaving the plant weak and often unable to bear its own weight. The difficulty appears to be constitutional; *i. e.* there is a failure on the part of the plant to perfect its normal structure—it is diseased. Whether it goes down or not will depend largely on circumstances of rain and wind, and indeed frequently apparently perfectly healthy straw succumbs to the inevitable before some severe storm.

2. It is the observation of all farmers, I think, that if grain lodges any considerable time before ripening, it fails to properly mature its seed. At any rate this has been my experience; whether this is because the plant is weak, or because of the position I do not know.

3. Lawes and Gilbert found, many years ago, that highly nitrogenous manures, with a deficiency of minerals, tended to the production of leaf rather than fruit stem. Now shade is one of the most fruitful causes of the failure to produce the proper amount of woody tissue within the stem, and no doubt the stem will be stronger and more woody where there is no excess of nitrogenous manures, and it will be able to carry its load most successfully when that load is light and low down; but these are the conditions usually associated with a poor crop. We raise grain for the heads, and want the shortest and strongest stem consistent with the production of the largest head. To attain the one end, grain, all experience teaches that the ground must be rich. The lesson that science would seem to teach, is to avoid an excess of nitrogenous manures, which tend to production not of grain, but of growth of plant, and that growth not firm and woody but long and weak. But it is nitrogenous manures that especially increase the yield of the wheat plant, and we are forced into using them freely. Certainly, any heavy crop, even if healthy, may, under adverse conditions, go down; but as a matter of practice, I would prefer to raise the heavy crops and take the chances, and I would apply manure freely, remembering, however, that a constitutional tendency to lodge will be likely to be induced by too free a use of the nitrates, causing abnormal production of leaf, and too much shading of the lower part of the growing stems.

4. Bearded varieties usually have shorter stems, and stiffer straw, and stand up better than the smooth sorts.

Agricultural College, Michigan.

FROM A. B. SAUNDERS.

1. I know of no remedy whatever for preventing an extremely rank growth of wheat from lodging.

2. Lodged wheat seldom ripens with the standing grain, being later. How well it will fill will depend on the time of lodging; if lodged while in the bloom, it will contain no grain at all.

3. No.

4. The beardless will stand best nine times out of 10. With a careful saving of the barnyard manure together with the correct rotation of crops and proper use of clover, I see no use for commercial fertilizers in Ohio.

Athens County, Ohio.

FROM JONATHAN TALCOTT.

1. Nothing, except to sow on poorer land.

2. I have had no experience with wheat or rye in lodging badly.

3. I have never had a field so manured. Generally there is too little manure.

4. Beardless, in my experience, has stood best. I raise but little wheat—no rye.

Oneida County, N. Y.

FROM D. C. LEWIS.

1. I know of no remedy that can be applied at the period of growth when the crop is falling down.

2. That will depend upon how badly it may be lodged, and at what period of its growth. If after it has headed out, I think it would fully ripen; if it lodged before, the grain could only partially fill.

3. So much depends upon the season that it is hard to decide just how much manure should be applied to produce a maximum crop. I prefer to manure so as to obtain the largest crop possible and risk the season.

4. Usually beardless wheat will stand up best under heavy manuring; but there are some kinds of bearded wheat, that will stand up just as well.

Middlesex County, New Jersey.

FROM H. L. WYSOR.

1. I know of nothing which will prevent wheat from lodging, though I have been particularly interested in trying to find out a satisfactory answer to the question. Growing wheat on an alluvial soil, where on the richest portions it lodges more or less every year, I have tried many experiments with a view to make the grain stand up, but all failed of success. I have tried salt in large quantities, commercial fertilizers containing no nitrogen, such as South Carolina floats, dissolved phosphates, potash mixtures, lime, etc., but they were of no benefit so far as lodging was concerned, if indeed they did not aggravate it. The heaviest crops of wheat are grown here on rather poor soils well fertilized.

2. As to how well wheat or rye will ripen when down, it depends upon how far either was from maturity when the lodging occurred. If nearly ripe, the grain will not be materially affected; but if just filling, it never fully matures, and shrivels badly, in some cases to such an extent as to be almost worthless.

3. I think there is no economy, but the reverse, in having a field so heavily manured as to put the crop in danger of lodging. It is true that succeeding crops will get the benefit of the manure, but that may be offset by the loss of the wheat or rye.

4. Bald wheats stand up much better than bearded. The latter hold water, the weight

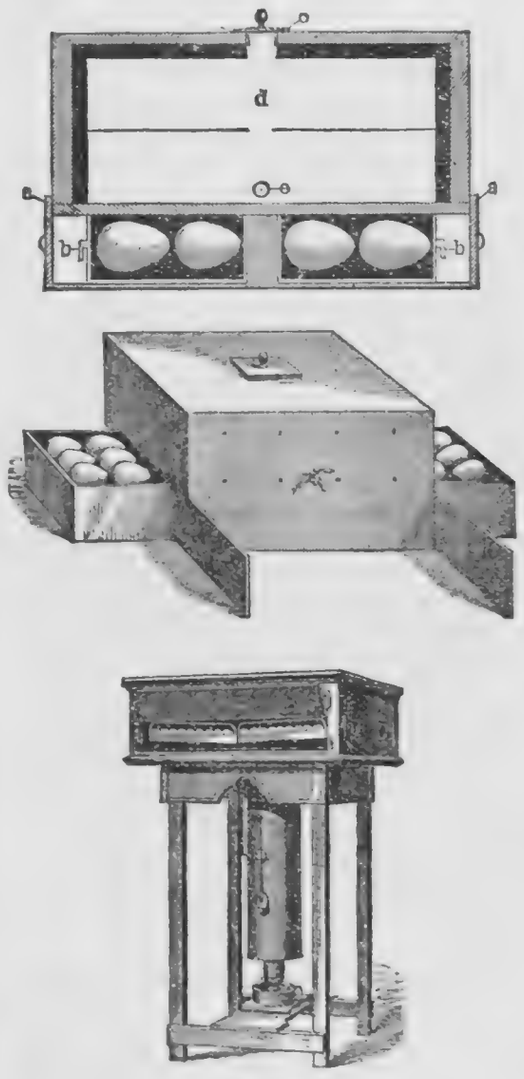


Fig. 162.

of which bends the stalks over when a brisk wind will prostrate them. Beards are not only useless but often prejudicial incumbrances.

BRINING BUTTER, ETC.

A Butter-Maker.—In preserving butter in brine; 1. How much salt should be put in a gallon of water? 2. What kind of package is best? 3. Should the butter be rolled or granulated? 4. Should it be salted before it is submerged?

ANSWERED BY T. D. CURTIS.

1. The inquirer does not say for what. If for washing butter in the granular form, we would dissolve about a pound of salt in a gallon of water, for the reason that a weak brine dissolves caseous matter, while a strong brine hardens it. If for brining butter and preserving it, make a saturated solution—that is, put in the water all the salt that will dissolve. At 60 degrees water will dissolve about 36 pounds of salt to the 100 pounds of water, or a little over one-third of its own weight. Use only the purest salt.

2. That depends on the market which the inquirer has. The general market calls for Welsh tubs of 30 to 60 pounds. For special customers fancy prints for the table are often preferred. For long-keeping, there is nothing better than the old-fashioned oak firkin, the butter being so completely covered with saturated brine that no air can get in. Air-tight packages are always best for long-keeping. Avoid stone-jars, and always consult the demands of the market for style of package.

3. Just what is meant by "roll" I do not understand. If the correspondent means whether he should pack his butter in a granulated or solid condition, I answer that he should make it as solid as he can. Some recommend keeping granulated butter in saturated brine. The objection to this is that it requires more space in the package, there is an unnecessary weight of brine, and as water contains more or less impurities—generally some organic matter—the more brine there is the more water must be used, and hence the more impurities there are to decompose and injure the butter. Hence it is better to make the butter as solid as possible, so as to exclude all unnecessary brine, but to cover the outside with brine to exclude the air.

4. Certainly. It contains on an average, 10 to 15 per cent of water. If this is fresh, it will weaken the brine, and thus diminish its preservative power. The brine in the butter should be saturated as well as the brine on the outside of it. The brine is contained only in the interstices, and does not really penetrate and salt the fat. Hence the butter may be kept in brine almost any length of time, and then, while still in the granular state, have all the salt washed out of it by using fresh water. If the water in the butter is already in the form of a saturated brine, no further salting is needed. The best way is to wash your butter thoroughly, while in a granulated condition, one or two of the latter workings being in weak brine Drain well, and then stir in about an ounce of the best dairy salt to the pound of butter. Then pack as closely as possible, with as little working as possible. Butter managed in this way requires no second working, and is best packed immediately, so as to give it the least possible exposure to the air.

CUT-WORMS.

J. J., Toronto, Can.—The inclosed grub is doing great damage cutting raspberry buds under ground, and also the shoots when three inches above ground. The pests eat the leaves and bark from young pear and apple trees. I found five, seven, and 13 at different hills of Marlboro raspberries. They eat the Minnewaski blackberries as they sprout. What will destroy them?

ANS.—The grubs are cut-worms. There are several species of these pests, varying somewhat in size and appearance, but very similar in their habits and manner of feeding. They feed during the night, burying themselves near the surface of the ground during the day, where they may often be found and destroyed. This is the surest method of extermination, as owing to their habits, they are difficult to reach with the ordinary insecticides. We would recommend 50 parts of sulphur to one part of Paris-green or London-purple sifted around the stems. The damage to the apple and pear trees was probably done by climbing cut-worms, another species of the same family. These might be destroyed by spraying the trees with arsenites, or their depredations prevented by some device which would prevent their ascending the trunk.

PRICES OF JERSEYS.

I. C., Town Hill, Pa.—I am forming a herd of registered Jerseys. I have made some purchases and am expecting to make others soon, and therefore it would be very interesting to me if the RURAL would give the recent auction prices and I think they would interest a great many other readers.

ANS.—At the Annual Combination Sale at the American Institute, the Breeders' Cup was won by a herd of five young stock, which sold at an average price of $190 per head. The herd of 29 head, embracing Mary Anne of St Lambert, averaged $607.94 each, Mary Anne bringing $2,100, and her daughter, Marianne Pogis, $2,300. At the series of Jersey sales in Tennessee, 31 head averaged $199.19; 10 head, $81.; nine head, $150 55; eight head, $60; four head, $50; three head, $110; and one head, $120.

GRAPE-VINE BARK LOUSE.

J. R. A., Reno, Pa.—What are the insects, like beet bugs, which are destroying my grape-vines, specimens of which are inclosed?

ANS.—This curious insect is a bark-louse which is found in different parts of the country from time to time and which belongs to an undescribed species of the genus Lecanium. It is allied to the black-scale of the olive in California and to the hemispherical-scale of our greenhouses. It can be very readily destroyed by the application of a dilute kerosene-soap emulsion. This genus, Lecanium, is a very large one and a very difficult one to study. Undescribed species occur upon a large number of plants in this country.

Miscellaneous.

B. R., Cadiz, Ohio.—Would it be advisable to breed a yearling colt this fall at about 16 months of age?

ANS.—No, the mare is altogether too young.

E. S. L., Holmen, Wis.—Are the rice plants of the South and the wild rice of the North closely enough allied botanically so that a cross can be made between the two? Is there any reason why such a cross would be impossible?

ANS.—Zizania aquatica is probably referred to. This so differs from rice (oryza) that it is probable a cross could not be effected.

"Chenango," Smithville Flats, N. Y.—1. Of whom in New York can I buy buhach or pyrethrum powder and London-purple? 2. Where can I get salt-glazed vitrified sewer pipes in 12-inch lengths?

ANS.—1. So far as we know there is none of the genuine buhach for sale in New York. The stock in California is limited. Persian or Dalmatian insect powder may be purchased at almost any drug store. London-purple is sold by the Hemingway London Purple Co., 90 Water street, New York. 2. Glazed pipe is sold by Jackson Bros., Albany, N. Y.

C. C. P., Brooklyn, N. Y.—I have a field of about seven acres that has been in corn for three years, highly fertilized. I intended to put it in grass this spring, but have been delayed till it is now too late. What is the best thing to plant for hay for my horses? Hungarian has been recommended; but I am told that it hurts a horse's wind, and my horse has a tendency to heaves already, unless fed carefully. What would the RURAL recommend under the circumstances, and how late can I put it in?

ANS.—Hungarian grass does not hurt horses in any way any more than Timothy would, if cut at the right time. You can sow Hungarian grass at once. It will require about 70 days for growth, and should be cut when it is coming into bloom.

DISCUSSION.

FRUIT BLOSSOMS.

PROFESSOR J. L. BUDD, AMES, IOWA.—Using the article by Mr. Proctor in the RURAL of June 8, as a text, the whole subject of the profuse flowering of the small fruits and orchard fruits at the West without setting fruit was discussed this morning in the Junior Class in Horticulture. In a very brief way the outlining of our conclusions in the RURAL may at least draw out some points of interest from some one or more of its numerous family of close thinkers and observers. These conclusions may be briefly formulated as follows:

1. So-called pistillate varieties of the strawberry on favorable soils and in favorable seasons, will develop enough perfect pollen on the short stamens to set a crop of fruit, while the same varieties on less favorable soil, or in less favorable seasons, will not bear a paying crop unless fertilized by perfect blossoms in adjoining rows.

2. Western experience favors the belief that purely pistillate varieties will not set a crop of fruit when remote from pollen-bearing sorts, yet if the season be favorable for the flight of bees and insects we often have a "sprinkling" of berries.

3. In our climate, and on our rich drift soil, some varieties of the raspberry, blackberry, grape, and all the orchard fruits, blossom profusely, but fail to set fruit when standing apart from other varieties on account of abortive or imperfect pollen, or the premature development of the pollen.

4. The intermingling of varieties of nearly all our small fruits and orchard fruits, has been found profitable. As our experience has seemed to settle the strawberry question as stated, I will only refer, at this time, to some of the reasons for the expressed beliefs in regard to the impotent and prematurely developed pollen, and the mingling of varieties in planting. My attention was first called to this important subject by the investigations growing out of the queries propounded by Dr. J. S. Houghton, of Philadelphia, in regard to the unfruitfulness of the Duchesse d'Angoulême pear, when by itself. In 1867 he succeeded in getting Prof. Thos. P. James and Prof. Horatio C. Woodward at work with the microscope and a full supply of the seemingly useless blossoms. After critical investigation, the conclusion reached was that the flowers were sexually perfect; but suffering from general debility. "Thus," says Dr. Wood, "the anther cells are large and finely formed, but they contain scarcely one-third as much pollen as those of more fruitful sorts. It seems to me further that the pollen grains are not so well developed, nor so crowded with granules." He adds; "What if there are comparatively few pollen grains. Provi-

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies.

dence has so provided that the great mass of pollen is superfluous.' It seems to me highly probable that the appreciable want of strength is associated with a similar, but less apparent degradation as regards quality."

Since that time Prof. Planchon, of France, has given much attention to this subject and found that on soils not altogether favorable the anthers of grape blossoms would appear to be larger and better developed than those in normal condition, yet the pollen was wholly abortive.

Dr. Stoll of Germany, also assured the writer that the anthers of certain varieties of the apple grown on the black drift soil of North Silesia were perfect in appearance, but wholly defective in pollen, At our college the same condition of pollen has been often detected in the blossoms of plums, grapes, apples, etc.

The cause of this condition of the anthers is as yet not wholly apparent; but, reasoning by analogy, we may reach conclusions not far astray. The Duchess, Hibernal, Silken Leaf, or Longfield apples; the De Soto, Wolf, Cherry, Wyant, or Early Red plums, the Spate Amarelle and some other very hardy cherries, the Concord grape, the Downer's Prolific strawberry, etc., have perfect foliage and a habit of determinate growth. Irrespective of the character of the season and almost without regard to soils, the cell structure of the wood is perfectly stored with nutriment for sustaining the first growth of spring, with enough to spare for perfect blossoms and starting the newly set fruit.

On the other hand, the varieties that blossom profusely without setting fruit are notoriously those that fail to complete the work of cell storage prior to the advent of the first severe frosts, yet many of these unsatisfactory varieties for common prairie culture develop perfect wood, perfect blossoms and perfect fruit when grown on soils more favorable for perfect maturation of wood, even in our own State; yet it is often the case that such showy bloomers will set fruit when adjoining varieties, with perfect pollen will not. Close observation has shown that the stigmas are usually perfect and that the statements of Lindley and other European scientists are reliable, viz: that when the fertilization of the stigma is deferred from any cause, the flowers will remain perfect—as Lindley says—"as if in expectation of that event for which they were created." When pollenation is deferred on account of defective pollen, the stigmas will retain their perfection and nectar for many hours waiting for the insect, or the pollen brought by the breeze, from adjoining varieties.

Another reason for intermingling varieties is found in the fact that some hardy varieties with perfect flowers in our climate ripen their pollen prematurely: but in mixed planting the pollen perfected before the stigmas are ready to receive it may be just in time for neighboring varieties. The effect of abnormal heat on the development of the anthers should receive more attention from our scientists. The close-observing Thomas Meehan has stated that in West Europe in monœcious plants, such as English hazel, the "female flowers would remain at rest under a temperature which was sufficient to excite the male flowers to active development. Hence a few warm days would bring the male flowers to maturity, while the female flowers remained to advance only under a higher and more constant temperature." Our liability to brief periods of summer-like temperature in early spring gives us many cases of this kind, where pollen is developed before the stigmas are ready to receive it. But in such cases the waiting stigmas may be fertilized in mixed planting by pollen of sorts maturing a little later. In these notes the object is to draw out the observations of others.

MILK FOR THE BABIES.

A. L. CROSBY, CATONSVILLE, MD.—P. H. R. says in a late RURAL, that "cow's milk is quite dissimilar to woman's milk." That may be so, but in the absence of mother's milk give the baby cow's milk (properly diluted, if it is Jersey milk; if it is Holstein milk it is watered about right for little babes) and it will thrive.

I was glad to read Mr. Gregory's views upon the healthfulness of eating diseased meat, if it were properly cooked. From what I have seen, and still more from what I have heard about diseased cattle being slaughtered for food, I try and keep my thoughts off of the subject while eating "bought" meat. But I guess Mr. G. is right; if diseased meat is thoroughly cooked there is not much danger in eating it. But how about milk from diseased cows? In this case we eat the raw disease: not only that, but we give it to the babies. Is it any wonder that there is so large a per cent. of deaths among babies? It is sometimes like this: The boy is sent to the field to drive up the cows and takes the dog along to help; the cows come into the barn-yard on the full run; the weather is hot and the man who milks, being tired and cross, kicks and curses the cows because they won't stand still. Is the milk from cows so treated fit food for a baby? Or perhaps a cow is sick, but so long as she gives milk that is not bloody, it is put in with the rest and sold. How is that for baby food? Or the baby's mother goes out to spend the evening; there is dancing and she dances two or three times ("that won't hurt me," she says), eats a late supper finished off with ice cream and cake, goes home, baby wakes up, mother nurses it; next morning baby is sick; next night dead. The doctor calls it "convulsions," but it is not that, it is infanticide caused by raw disease in the mother's milk. One of my neighbors who sells milk lost a cow the other day. The veterinarian said she died of apoplexy of the heart. My neighbor continued the *post mortem* after the veterinarian had gone, and found that a piece of wire had pierced the stomach. The cow was "all right" that morning, her milk was good (?), was sold as such and honestly too, as she showed no symptoms of disease, but there must have been some raw disease in that milk which, if it found the right breeding ground in a baby's stomach, may have caused a little string of crape to appear on some one's door knob.

ON THE FENCE.

S. E., MONTGOMERY COUNTY, OHIO.—I was much interested in reading Prof. Porter's article entitled "What are the Agricultural Colleges Good For" and I am pleased to learn that the publication of the article has attracted the attention which it deserves. The Professor has certainly made out a strong case. No one would be more gratified than I would be to be convinced that he is mistaken. I would be loth to believe that the more a boy is educated in the line of agriculture the more he will be disinclined to pursue it. Yet the logic of the Professor's article indicates that this will be the usual result unless such education is conducted somewhat cautiously and sparingly. On the other hand it will be difficult to convince the average farmer of the utility or necessity of a technical course of training at an agricultural college so long as graduates of these colleges do not demonstrate their superior fitness for agricultural pursuits, and so ong as our most successful and practical farmers come to the front without the aid of the agricultural colleges, while they almost entirely ignore our farmers' clubs and institutes.

EFFECTS OF THE FROST.

J. H. A., RANDOLPH, N. Y.—There is a good deal said about the damage done by the late frost in this part of the State. The truth is that the people are croaking all around that everything has gone up or down. It's true we have had a very severe frost and that it has done no good if no harm, but what is the use of groaning about it. I have had no time to croak or groan. I made up my mind at once that doing so would be of no use, so have kept right along and if anything, worked all the harder and thought all the more, and I believe I am all the better off for it, too; for I find my work is well up with the time of year, my grass and grain are looking fine. I can't see that wheat is injured and I find a fair crop of apples in the orchard. My corn is nicely up again and seems to be growing. I have lots of good feed for the cattle in my pastures. Now what more could I ask? If I were to find fault at all, it would be that I have had to work a little too hard some of the time, yet it affords me much pleasure to look around and see that the work has accomplished something.

A "GENERAL-PURPOSE COW" MAN.

J. S., CORNING, IOWA.—People are telling about the sort of cow that suits them, so I may say a little about the kind of cow that we think we must have here. We want one that will give a good yield of butter and whose steer calves make good feeders which, when fat, are good enough for export. I have been breeding and selecting for 16 years; but the cow I want seems a long way off yet. I have tried crossing a Jersey bull on grade Short-horn cows, but I could not discover that it helped the butter either in quantity or quality, and the steer calves—well, I don't believe one could find in Webster's-Unabridged all the words my neighbors used in describing them.

ANOTHER DAIRY RECORD.

A. R., NOTRE DAME, IND.—On an Indiana farm on January 1, 1889, it was found that 1,702 pounds of milk made 87 pounds of butter and again on February 12, 1889, 249 pounds of milk made 120 pounds of butter, the thermometer standing at 62 degrees Far. On May 17, 1889 the usual test showed that 768 pounds of milk produced 31 pounds of butter, thermometer at 70 degrees and finally, on May 21 it was found that 800 pounds of milk, made 36 pounds of butter, the thermometer being between 59 and 60 degrees Far. The cows producing this amount of butter are of common stock, with the exception of a few Holstein grades, and their feed was Timothy hay, with ground corn and oats.

O. T., ELIZABETH, N. J.—J. J. H. G. on page 398 of the RURAL, makes some very interesting, though I must confess, to me not very attractive statements. Are all the efforts of legislators, boards of health and others in authority to protect the people at large from danger incurred by eating diseased, decayed, and tainted meats, and other foods, the result of ignorance, bigotry, and prejudice? Are we so far behind the natives of Northern India? Are we, with our boasted civilization, so far behind the times as the statements of J. J. H. G. would imply? It may be all "sentiment," but I don't want any diseased or rotten meat on my table, and, further, my eyes and nose are not "all the police" I need. In the case of the car-load of cattle afflicted with "lump-jaw" mentioned in the news columns of the RURAL recently as having been seized at Buffalo, a physician who examined them said they contained poison enough to kill all the people in the State, and we are told, further, that after such cattle are dressed, it is impossible to tell their carcasses from healthy meat. In New York only a few days ago, the authorities closed up a lot of stalls on one of the piers, on the ground that the exhalations from the sewers emptying into the river under the piers, rendered the meats and vegetables there exposed, unfit for food. This was done "in deference to public sentiment." Are not all the laws against adulteration of foods enacted in deference to this same sentiment? The average legislator cares about as much for the health of the community as he does for the tariff, which is very little. His chief concern is to be re-elected. So it is best not to discourage this sentiment. I don't want any diseased or decaying meat on my table, and when I cannot get that which I am reasonably certain is healthful, I shall live on fruits and vegetables even though they be raised on such "disgusting substances" as night-soil.

A. C. P., BINGHAMTON, N. Y.—On page 403 of the RURAL a correspondent asks how to dry rose petals. Spread the petals on a sieve in shallow layers, dry in a cool dry place out of the sun. For perfume jars where the looks are of no account, mix layers of leaves with fine dry salt between. The whole process is very simple, but requires care and some skill.

TO SEVERAL INQUIRERS.—The R. N.-Y. sold the entire stock of the Rural New-Yorker No. 2 potato to J. M. Thorburn & Co., several years ago. They propagated it and placed it on the market the past season. All the other seedsmen in the country who offer it for sale were obliged to purchase their stock of that firm.

What Others Say.

FERTILIZERS. In the proceedings of the Western New York Horticultural Society we find a most interesting and instructive essay on fertilizers. For an imaginary experiment Dr. Caldwell, the writer, says let us bore some holes in the bottom of a pail, and lay a piece of coarse flannel over the bottom, merely to keep the sand or soil with which we afterwards fill the pail, from running out through these holes; then we will nearly fill the pail with some clean sea-shore sand, and pour in some manure water; in a very short time some of the liquid will appear at the bottom of the pail, having sickered down through the sand and through the flannel. We examine the liquid, and so far as appearance goes it is the same kind of a liquid that was poured in, and if the chemist makes an analysis of it he will find that it contains every thing that was in the manure water to begin with. Now if we change the experiment a little, and in the place of manure water use a weak solution of potash, or of a phosphate, or of sulphate of ammonia, or of nitrate of soda, we shall get just the same result practically; the water that comes out at the bottom will contain just as much potash or phosphate or ammonia as that which went in at the top; only a close chemical analysis could show any difference.

Now let us vary the experiment, and put some good loam in the pail in the place of the sand, and begin as before with manure water; we shall no longer find that what comes out is just like what goes in; instead of being dark-colored and bad-smelling it will be much lighter-colored, if not as clear as well water, and as odorless; we can tell by our senses that it has given up much of something to the loam, and a careful chemical analysis will show at once that there has been much of a loss that we can not make out by sight or smell—that, in fact, nearly all the potash, phosphate and ammonia is wanting. If, as before, we vary the experiment again, and instead of manure water pour a weak solution of potash over the soil, almost no potash will come through, and so it will be with the phosphate or the ammonia salt. Further, if we take this pailful of soil after it has been charged with any one of these substances, and drench it with water, we shall find it almost impossible to wash out the potash, phosphate or ammonia salt, left there from the solution that was poured through in the first place; we may wash the soil with a hundred times as much water as that which was first poured on and still not get out again all that was left there.

The wonderful property of the soil, by which some of the most valuable constituents of the food of plants are seized hold of at once, as soon as presented to it in solution, and securely stored up till called for by the proper parties, is one that has a very important bearing on the farmer's work. It is this that makes it safe for him to spread his stable manure in the fall for a crop in the spring; it is this that makes it safe, within limits, to put on a rich dressing all at once without fear of so charging the soil water with plant food as to damage the plants; it is this that distributes the food uniformly in the soil, so that the plants will find it wherever they go, thus inducing a good and wide-spread root growth, that is so much more serviceable in time of drought than a growth would be confined in spots here and there, where the roots might chance upon a rich deposit of phosphate, potash, or nitrogen compounds. And with all these advantages there is not coupled the disadvantage that would be fatal, that this food is put beyond the reach of the crops; for they have with them the key to unlock the bank, and they can get all the food that they have vitality and energy enough to work for.

But there is one feature of the case that must be noticed: nitrogen, as nitrates, is one of the most useful forms in which to supply this very important food; many say it is by far the most important of all. Now, in this experiment with the pailful of sand in the first case, and of loam in the other, if we pour in a solution of nitrate, we shall get nitrate at once in what pases through in both cases, and as much in one case as the other, and we may try the experiment with any kind of soil with the same result; we shall not be able to find any one that can store up nitrate, while any and every one will store up potash and phosphate in quantities far beyond the most liberal dressing that would ever be applied to it.

This fact has an important bearing on the use of any fertilizer containing nitrates, and the lesson it teaches is that such a manure should be applied to the ground while the crop is growing, and in moderate doses at a time, never in the fall for a spring crop, and not even all at once in the spring, but at two, three or four times during the rapidly growing season. Scattered on the surface of the soil, not even the highest heat of the midsummer sun can convert any of it into vapor so that it will pass off into the atmosphere; it will be secure there till the rain comes; then it is quickly taken into solution and carried into the soil, where there must be an abundant root growth of vegetation to take possession of it on its way down; for on its way down it will surely go as long as any water flows through the soil to carry it.

It seems to Dr. Caldwell almost certain that a dollar invested in nitrogen, as nitrate of soda, with the proper management of its application to the crop, will yield a better return than a dollar invested in nitrogen in any other form.

The lesson is, that nitrogen in every form is liable to loss by leaching through the soil. Potash and phosphate, when once put on the soil, the farmer can forget and yet not lose; but as to the nitrogen he must ever be on the watch, and his aim must be to get it back again in his crops as soon as possible. The fewer the weeks or months in the year, in the warmer season when the bacteria are producing nitrate most rapidly, that the soil is bare of any growing crop the better; and the richer the soil the greater the need of constant vegetation on it, from spring to fall, to catch the nitrate. This may be an advantage, perhaps, that market gardeners have over the ordinary farmer, that they have their rich and well tilled soil, in which nitrification must be going on very rapidly, so well covered with crops during the warm season that there can be very little loss; and we may find there an argument against summer fallow

ing, that the nitrate formed while the land is unoccupied by vegetation may be lost before the crop is put in which is to be benefited by the fallow. Certainly some sort of a useful crop should come in late in the summer, so that the leaching out of plant food may not be allowed to go on all winter.

FULL AS A TICK.

MR. W. J. GREEN, of the Ohio Experiment Station, says in the Massachusetts Ploughman, that the cost of bunching asparagus may be reduced nearly half by using small rubber bands instead of strings in bunching. Unless labor is very cheap the saving is sufficient to pay for the additional cost of the rubber bands.....

LEAVING out the question of economy of labor, rubber is so much superior to strings that it could be used with profit even though it cost five times as much as at present. This is because no matter how tightly tied, strings will become loose after the asparagus has become slightly dried, and the bunches will fall to pieces .....

MR. GREEN commenced using rubber bands in order to save time in bunching, and found that they paid him on that account alone, but the dealers were quick to observe the advantage that it gave them, and the asparagus soon sold at an advance of about five cents per dozen bunches above the regular market price.

A GOOD METHOD of bunching is to slip a rubber band over an ordinary tea-cup, holding it near the top of the cup. Then fill the cup with the asparagus to be bunched, thrusting the heads of the shoots downward into the cup. When the cup is full, pull the rubber band over the top of the cup upon the asparagus; remove the bunch from the cup and slip another band over the bunch near the tops. This makes a bunch of about the right size and leaves the top of the bunch nicely rounded. All that remains to be done is to square the buts with a sharp knife.....

WM. C. STRONG says, in Popular Gardening, that grapes are usually increased in size at least 25 per cent. by girdling or ringing and the time of ripening is hastened from ten days to a fortnight, or more, depending upon the season. With some varieties this point of time determines very certainly the success or failure of the crop. The time for doing this work of ringing is soon after the setting of the fruit, when the berries are about the size of peas.....

THERE is a good deal of difference of opinion on this subject. R. N.-Y. readers have already had the views of its correspondents. Professor Maynard of the Mass. A. C., says that no injury to the vines girdled has ever been detected, even where the girdle was made on the main trunk near the ground. The time of ripening is generally hastened by one or two weeks. Careful sugar tests show no injury to the quality of fruit. The fruit was larger, more beautiful and sold for from three to five cents per basket more than that from ungirdled vines. For reasons of economy of the vine, only a part of the cane of each vine should be girdled and only those that are to be cut away.....

HE further says, in the same Journal (Popular Gardening), and he merely repeats what we have quoted from his reports, that good results were obtained when wires were twisted about the canes, but only when twisted very hard with pincers. For this purpose about No.20 annealed was used and the work done late in June. From his experience he believes that girdling will result in profit to the vineyardist, and in much pleasure to those who are growing choice late grape varieties..

OUR RESPECTED FRIEND, Secretary E. Williams, says ringing or girdling is done for the gratifying of one's curiosity and vanity or perpetrating a fraud.....

PROF. W. A. HENRY, of the Wisconsin Experiment Station, alludes, in the Breeder's Gazette, to a plain cow in the herd, that had no friends. She minded her own business strictly, giving a fair amount of milk, and might have been sold at almost any time for about what she cost ($35). In the same barn were several animals that had cost much more money and were supposed to be superior. A churn test showed that this cow was giving fat enough to make one pound and fourteen ounces of butter daily, while some of the superior cows, standing beside her eating the same amount of feed, gave but little over one pound per day. Such a difference as this will not strike some farmers as very important, perhaps; let us look into the matter a little further. With butter at 20 cents per pound this cow was giving about 37 cents' worth per day, and the other cows from 20 to 25 cents' worth. Here is a difference of fully 12 cents per day in favor of the unpretentious cow. But these figures do not show the entire difference by any means. It cost something like 15 cents per day to feed and care for each of these cows. Subtracting this from the value of the product, we have 10 cents a day for the supposed good cows and 22 cents a day, or more than twice as much, for the plain cow.....

DAIRYING is hard work, Prof. Henry concludes. Cows must be milked and fed seven days in the week and twice a day. Why should a man do this year after year, treating all his cows alike, when a portion of the herd is steadily working to bring him in debt at the end of the year, and another portion yielding good profits? Prof. Henry guarantees that 99 farmers out of 100 who will start a thorough investigation to determine the merits of each animal in the herd will welcome the traveling cattle buyer to the farm within one month from the time the investigation begins.....

MR. O. S. BLISS'S acquaintance, as he informs the Philadelphia Press, an aged Scotchman, has stabled a herd of Ayrshires, the most vigorous and active of cattle, without loosing them from their stalls from fall till spring, through more winters than Mr. Bliss can remember, and no man's stock ever comes out in the spring in better general condition than his. He has prospered until he has absorbed farm after farm, while his neighbors who croak about his cruelty to his cows have kept on in the old way of wasting food, milk and flesh into the wintry air till several of them have been compelled to sell out and seek a more genial climate in which to practice their method of wintering cows .....

THE editor of the Press says that a cow in order to maintain her vigor must have in addition to abundance of wholesome food, pure air, sunshine and a chance to tone up her muscles with moderate exercise. These are essential to the health and well-being of every other animal in the Universe, and the Almighty made no exception in the case of the cow.....

THE Kentucky Experiment Station found last year, that copperas (sulphate of iron) decreased the yield of ear corn per acre five bushels.....

THE LONDON GARDEN, in a plain article instructing its readers how to prune rose-bushes, says that the commonest mistake is the leaving of the older branching spray wood that has already flowered. Rose bushes at the beginning of the year generally consist of several much-branched stems which carried bloom in the previous summer, and several strong straight shoots springing from the base of the plant. In the case of Hybrid Perpetuals, these older branching stems should be cut completely out, leaving only the new shoots from the base which themselves should be then considerably shortened. If the old spray would be left in it produces no flowers worth having, while the weak and crowded growths with which it becomes covered afford a perfect harborage to every known Rose pest. Nevertheless, it is a common thing for the unlucky rose bushes in many gardens to be uniformly clipped over with the shears, much as a hedger might top a hedge and then the people wonder why they never have good roses.....

THE only way in which a fine healthy growth can be obtained strong enough to be exempt from the attacks of aphides and able to carry beautiful flowers is by cutting out all the old wood that has done its work in having flowered the year before, and relying solely upon the straight new shoots. The extent to which these should be shortened depends rather upon their thickness than upon their length. If they are no thicker than a cedar pencil they may be cut right down to the base; if they are as thick as a finger they may be left three inches, six inches, or nine inches long where the wood is sound—that is to say, is well ripened and uninjured by frost. At first it may seem to many a great waste of material to cut these stout shoots, which are often five feet or six feet long, down to within six inches of their base, but it is rarely advantageous to leave a greater length than nine inches at the outside. It must be borne in mind that the new growth starts from the tops of the pruned shoots, and therefore if these are left long the effects of a high wind in early June are liable to be disastrous, the weight of foliage and flower buds at the end of a long stem causing them to sway to and fro and chafe against each other, or even to break short off.....

MR. J. J. H. GREGORY says, in the New England Farmer, that the White Barletta onion is the earliest of all. It is of a fine white color and bulbs raised from the seed sown will mature about as early as those raised from sets .....

DR. TALMAGE says, in the Observer, (N. Y.) that early rising is not necessarily commendable. All depends upon what one does after he gets up. It would be better for the world if some people never got up.....

A NEW seedling coleus has been raised by Mr. W. H. Cornish. The greater part of the leaves are clear carmine marked with deeper, redder spots, while the scalloped edge is a light green. It is a very promising plant, and will be used largely by florists for decorative purposes. Mr. Cornish has several new greenhouses in which he will propagate this and other novelties. The coleus is as yet unnamed .....

ABSTRACTS.

——DR CALDWELL, in N. Y. Tribune: "Allowing 1,600 pounds as the weight of a two-horse load of stable-manure, and calling its quality just ordinary, 14 loads would contain as much nitrogen, posphoric acid and potash as would cost nearly $25 if purchased in commercial fertilizer."

——"I ALWAYS say to my students, when I come to this subject in my lectures, that any bed of muck is worth trying, for it may be a small mine of wealth, and that it should not be condemned as worthless till a fair and thorough trial has been given to it, and that the only way to find out whether it is worth anything is to give it such a trial in the field."

——"THERE come hard experiences in most lives, when self-denial must be practiced and many things which are desirable done without; but it is to a great extent left to our choice whether this shall be during the strength and enthusiasm of youth, or when the infirmities of age are upon us." [Note this well, young readers of the R. N.-Y.]

——DR. PETER COLLIER: "It is entirely within bounds of facts to assert that there are at least 10 per cent. of our farmers, in whatever branch of agricultural industry they may be engaged, who are getting double the return of the average of those engaged in that branch—twice the bushels per acre, twice the pounds of butter per cow, and this, too, simply by improved methods and intelligent application of the fundamental principles of success which should govern their practice."

—— PACIFIC RURAL PRESS: "There is a foolish desire on the part of American youth to avoid work, or at least what is termed hard work, but no one need expect to succeed without work and plenty of it. That which appears easy looks differently when we can get at the actual facts. Many, tired of farming amid the stones and stumps of New England, come to California, buy an orange grove or a fruit farm, and imagine that all they have to do is to sit down and watch their fruit grow."

——PROFESSOR A. J. COOK, in the Proceedings of the Western New York Horticultural Society: "The best remedy for the curculios is Paris-green or London-purple. It will kill them sure. They eat both leaves and plums."

——HOARD'S DAIRYMAN: "A 'light straw' is the color wanted for butter."

——"THE practical questions are whether cud-chewing, by bovines, does not obviate much of the supposed necessity of having them roam especially for exercise; and if so, whether the pasture that will raise three or four times as much of soiling and silage foods, cannot be profitably dispensed with. We think the main question has been amply demonstrated, and the farmers who choose, can avail themselves of the new method, with confidence that they will succeed."

——COL. F. D. CURTIS, in Hoard's Dairyman: "I have said comfort was essential in the dairy. This must not end entirely in the effort to keep the cows out of the cold. In summer they should be kept out of the heat and flies. More milk and butter can be made from cows kept up the year round than in any other way. I would make an exception of the nights in hot weather, and turn them out into a night pasture. If not kept up all of the time, and fed in a stable on succulent foods and bran and meal, then they should have a regular feeding night and morning. He is not a wise dairyman who does not follow this plan."

——COMMERCIAL BULLETIN: "The melon that is probably the least likely to be surreptitiously carried off is the cantaloupe."

S. G. CURTICE, Western New York Horticultural Society: "To-day a Western mining camp can set forth as elaborate a menu, from the soup to the plum pudding, making use of canned goods only, as any of our metropolitan hotels. At our sea-side resorts green peas and fresh tomatoes are served, in their season, from the little green cans, without suspicion on the part of the guests that the vegetables are not freshly picked, and greatly to the profit of the landlord who could hardly spare from his working force an army of pea-shellers and tomato-parers."

——JOSEPH HARRIS; "At the present price of wheat we cannot afford to buy nitrogen as a manure for this crop, and still less for corn. The profit of using nitrogen depends on the price of the product. Artificial manures will make trees grow, but it would not pay to use them on a timber lot to grow wood for fuel at $3.00 per cord."

——"BUT it should be understood that when we use manure for fruit trees we should see that the fruit trees get it. If we grow wheat, oats, potatoes, beets, strawberries and seeds among our peach, pear and apple trees, we should have to furnish an excessive supply of nitrates before the fruit trees would get much of it. The greater portion would be absorbed by the annual crops and weeds, and it may well happen that a moderate dressing of manure would, by increasing the growth of the weeds, actually lessen the crop of fruit, for the reason that the greater the growth of weeds the more water they evaporate and the drier would be the soil where the roots of fruit trees are searching for food and water."

——"THE soil itself will hold the phosphoric acid and potash and the plants will hold the nitrogen."

——T. D. CURTIS, in the Dairy World: "The proper way to give practical instruction is through a permanent institution, where all the conditions, from the breeding and feeding of the cows to the perfection of the dairy product, are under perfect control. This alone will secure practical results which will be a satisfactory ocular demonstration to the looker-on and listener."

——N. Y. HERALD: "Dear Sun—When you get right down to bottom facts—this is *sub rosa*—our real objection to the sunflower as a national emblem is that the thing is everlastingly seedy. Now will you give up the fight and come over to the sweet-scented and modest violet?"

As a Drink in Fevers
Use Horsford's Acid Phosphate.

DR. CHAS. H. S. DAVIS, Meriden, Conn., says: "I have used it as an accessory in cases of melancholia and nervous debility, and as a pleasant and cooling drink in fevers, and have been very much pleased with it."—*Adv.*

Miscellaneous Advertising.

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds, it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

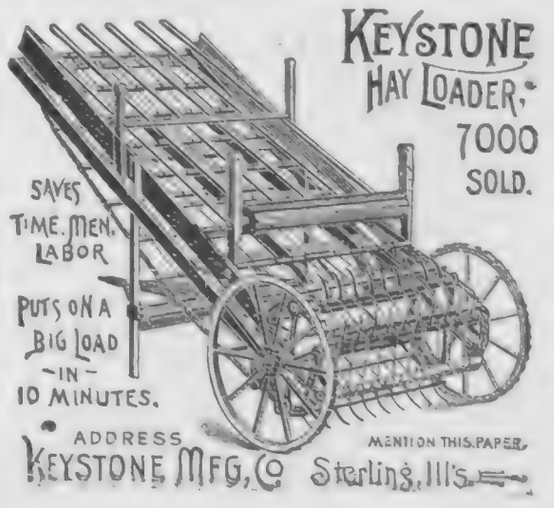
100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lameback, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

BEACHAM'S PILLS cure sick headache.



THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JUNE 29, 1889.

NEVER before, in the experience of the R. N.-Y. people, have blackberry vines been so laden with fruit. The writer has just counted 200 clusters upon a single plant of Taylor's Prolific, the clusters averaging 20 berries each, making 4,000 berries on the plant. Other varieties are similarly laden.

THE Rural Farm has nine acres of Armstrong (Landreth), the finest wheat we have ever raised. In years past, this variety has generally lodged more or less. Last fall the fields were given a good spread of unleached ashes. Though gales and heavy rains have been more frequent than in ordinary seasons, no portion of the wheat is down.

AS OUR readers were at the time advised, we grafted half a dozen cions of the Japan quince upon an apple tree in the spring of last year. The cions have made a growth of 18 inches and one of them bloomed a week or so ago. The union does not seem quite congenial, however, as the quince the past spring made a rather feeble growth.

CAN Western farmers afford to produce sorghum cane? This is a question that is puzzling many Kansas and Iowa farmers just now. It seems to be settled that the sugar factories can pay not over $2.00 per ton for the cane. At that price, will sorghum pay as well as corn? Must sugar-producing plants be grown so cheaply that there will be little or no profit to the producer? A number of our Western friends are writing us on these topics. Their opinions are interesting. We shall print them shortly.

"Instinctive unrest may be noticed among animals as the precursor of a storm, but these appearances are not reliable, as such animals really know no more about the weather than their owners."—C. S. RICE, page 438.

THE grubs of the asparagus beetle, the ways of which we have had only too good an opportunity of observing the present season, prefer the terminal shoots and leaves, they being more tender than those below. They eat the youngest leaves first, then the bark as they descend, leaving only the dry, dead twigs above them. The R. N. Y. sprayed its plot of asparagus thoroughly with pyrethrum and hellebore. The remedy is by no means a perfect one, as after two sprayings many grubs and beetles were still feeding upon the plants. We shall next try London-purple or Paris-green.

SUGAR of milk is a substance quite largely used in the manufacture of pills, homœopathic medicines, etc. Heretofore, American manufacturers have been obliged to secure most of their supply of this material from Switzerland and Bavaria. It is now proposed to supply the market with a home-made product, and already two factories are running in New York State with a third to follow shortly. Milkmen will find in these factories, a small measure of relief from the present over-production of milk, and if cheaper manufacturing processes can be developed so that all the sugar of milk needed in this country can be made at home at a reasonable cost, there will be saving enough to make itself generally felt.

WITHIN the past 10 days the R. N.-Y. has made a thorough trial of using unleached ashes and Paris-green instead of plaster and Paris-green upon potato vines. It was hoped that the ashes would repel the flea-beetle, and serve just as well to extend the poison as plaster, while, at the same time, serving, as the rains carried it to the soil, as an excellent fertilizer. Our ashes were sent to us by Munroe, Judson & Stroup, of Oswego, N, Y., and were of the best quality. One pound of Paris-green was used to a barrel of the ashes, and after a thorough mixing, it was sifted on the vines. In two or three days it was evident that the leaves were harmed by the application. Possibly an inferior article of ashes would serve better.

THE Superintendent of the next Census wisely calls attention to the need of correct estimates of the valuation of farm property. Any man who has acted as assessor in any rural community knows what a large proportion of farmers have difficulty in setting a fair estimate on their property. This should not be so. A man doing business of any kind ought to know what his business is worth. It is very important that the census returns should be as reliable as possible. These returns, singly or collectively, are made the basis for figuring and deductions that vitally concern farmers as well as every other class of citizens. Let us be ready for the next census so that we can give intelligent and reliable estimates concerning our business.

A SUBSCRIBER in Thomas County, Kan., after speaking of unusually bright agricultural prospects says:

"Many farmers, I am sorry to say, are being induced by the bright prospects to incur heavy debts which will place them at so great a disadvantage that they cannot reap the full profits or enjoy the happy results of a bountiful harvest. Our loan agent informed me last week that he had, since the first of March, made 25 loans, aggregating $9,000, on real estate tributary to our little town of about 100 inhabitants."

Here we have a suitable text for a long sermon. Gentlemen—when times get so promising that money comes into your hands, the proper thing to do is to hold on to it

WHETHER it is in accordance with science and practice to place the manure or fertilizer very near the surface, incorporate it *with* the surface soil, or place it several inches or a dozen inches below is a very important question, and one that the experiment stations might well work upon. This is the fourth year that the R. N.-Y. has placed fertilizers immediately below and four inches above seed potatoes. Until the present year the answers given by the crops have been contradictory. At present the plots which received the fertilizer *above* the seed pieces are looking notably better than those that received it below. The very wet season may have something to do with it.

The largest crops of corn which the R. N.-Y. has ever raised were from fields upon which the fertilizer was sown broadcast and harrowed in.

IN Northern New Jersey many farmers are straw growers. They raise the rye that gives them the heaviest growth of straw. This straw will sell for more money than the grain from a Western wheat field. It seems to be generally understood that a straw farmer must live near a great city in order to make his business pay a profit. There is hardly a rule of agriculture, however, that will not present exceptions. A friend in Eastern Oregon, hundreds of miles from any town of importance, writes that he wants the grain that gives the heaviest straw. The crop is cut before the grain is ripe, and cured and stacked for hay. This is fed to cattle and horses which have legs to carry themselves to market. This "grain hay" gives more feed than any of the grasses. Wonderful are the different methods employed in the agriculture of this country. No one can justly claim to "know it all."

NEW ENGLAND appears determined still to maintain its immemorial reputation for leading in reformatory movements, and in this respect, of course, Massachusetts holds the proud position of leader and representative of her five sister States. The grand old Bay State has just come to the front, in needed humanitarian legislation, not only of all other States in the Union, but of all States in the world, by enacting a law against the docking of horses. Who can gainsay the proud claim of the Massachusetts Society for the Prevention of Cruelty to Animals, that it has obtained the first law in the world against this heartless fashion; secured the first three and only convictions ever obtained for the practice, and offered the first and only prize—$100— for evidence leading to conviction? Eighty-two ladies holding the highest position in Boston society have just issued a protest against the cruelty, and if only the other ladies in the country—God bless them!—would join their advanced Massachusetts sisters, how long would this inhuman fashion be able to withstand their righteous indignation?

"I sow my Timothy in the spring with the clover, however, as otherwise the clover would be sown on a Timothy sod and stand but little chance. Thousands of bushels of clover seed are wasted in this way."—T. B. TERRY, page 426.

AFTER a very bitter contest, lasting several months, the Rigsdag of Sweden has passed a law which prohibits the importation of oleomargarine from foreign countries—chiefly America and Holland—and places severe restrictions upon the manufacture of the product at home, and the cable tells us that the Swedish farmers are jubilant because they have at last received the protection they justly claimed. People acquainted with both sides of the Atlantic agree that, as a rule, laws are more faithfully enforced on the other side than on this. It may turn out, therefore, that the Swedish farmers may continue to have more cause for rejoicing at the enactment of an "anti-oleo" law than American farmers have. In spite of the general national "anti oleo" law passed by Congress and the various circumscribed laws passed by different States, the production of oleomargarine in this country last year was one-third greater than in the preceding year—it had increased from 30,000,000 to 45,000,000 pounds! The Treasury statistics show no proportionate increase in exports of the product; so that it must have gone into consumption chiefly at home. The object of all the laws was to restrict its sale, and this object all the laws failed to accomplish.

IT would seem that as the formation of successive trusts goes on, the new monopolies learn how to improve upon the lessons of greed set by the old. In some cases too the Lilliputians among them outdo the Brobdignagians in unscrupulous covetousness. A good example of this is the Wood Acid Trust. This is commonly known as the United States Acid Manufacturers' Association. It was completed at Binghamton, N. Y., on April 9, last. Its members make crude wood alcohol as their chief product, and acetate of lime and naphtha as by-products. Last April, owing to excessive competition and over production, there was little or no profit in the business. The combination, however, at once put up the price of crude wood alcohol from 47 to 57 cents per gallon, or over 20 per cent. and there was a proportionate advance in the by-products of the factories. The results were eminently satisfactory to those present at the second meeting of the association, held at Olean, N. Y., the other day, at which all the leading factories in the country were represented. It was voted unanimously to maintain the existing price of 57 cents per gallon on all the crude alcohol now on hand in factories and warehouses, and to fix the price at 60 cents for the new product made during the coming 60 days. Are farmers in any way more interested in the operations of this "combine" than the general public? Yes; for wood alcohol offers itself as a cheap substitute for grain and fruit alcohols in mechanics, manufactures and arts, and farmers are naturally more interested than others in a competing business.

KEEP IT BEFORE THE PEOPLE.

"SOME manures, such as common salt or nitrates, circulate with the water in the soil, in dry weather rising to the surface, in wet weather descending. Other manures (phosphate and potash) unite with the soil near the surface, and either remain there or, at all events, descend with extreme slowness. As an instance of the extreme slowness of the descent of manure, I may mention the dung applied to our permanent wheat crop—14 tons annually for 40 years. Almost the whole of the accumulation of fertility is to be found in the first nine inches from the surface. *Under ordinary agricultural processes, it may be said that manure only enriches the surface soil.*"

Thus Sir J. B. Lawes wrote to the R. N.-Y. several years ago. Reasoning from such data (the most trustworthy we have), Mr. Mapes holds the opinion that fertilizers, as well as manures, should not be placed too near the surface for the reason that the roots of plants are thereby induced to grow nearer the surface and to suffer in consequence during periods of severe drought. This has not been the R. N.-Y.'s experience.

A TARIFF ON BANANAS?

IT appears that many small fruit growers believe that the trade in bananas, pine-apples and other tropical fruits is of considerable injury to the trade in American fruits. Some of them go so far as to demand that a high duty should be levied on foreign fruits. Strawberry growers have complained most bitterly this year. While strawberries were at their best, the markets and street stands were literally crowded with pine-apples and bananas, and strawberries, being the more perishable fruit, could not wait until the glut could be relieved; consequently, thousands of boxes were spoiled. Now the strawberry growers say that if the supply of tropical fruit had been cut down, the berries would have commanded better prices. There may be something in this, and yet people buy bananas and pine-apples because there are distinctive flavors and qualities about these fruits that are not found in others. A strawberry never will take the place of a banana to the person who wants a banana. The trade in tropical fruits is rapidly increasing. In 1888 there were admitted, free of duty, $5,787,867 worth of such fruits, and $3,154,654 of this amount went for bananas. In the same year duties were paid on $14,714,456 worth of fruits, including figs, lemons, oranges, prunes and raisins. With the exception of figs and raisins, there has been a gradual decrease in the value of the imports of dutiable fruits. The values of the fruits admitted free of duty have rapidly increased and this is most marked in the case of bananas In 1884 $1,878,279 worth were imported while in 1888 $3,153,654 worth were received.

"If of German parentage they are sure to lift the mortgage. If of Irish, they are not quite so sure, and if of an old American family, they are still less sure of doing so." W. L. DEVEREAUX, page 438.

BREVITIES.

READ Henry Stewart's article on page 439.

STRAWBERRIES owing to the excessive rainfall, are rotting on the vines.

THE R. N.-Y.'s prediction of a drought this summer in the East has thus far been fulfilled to the extent that it has been the wettest season within our remembrance.

THIS seems to be a year for remarkable "freaks" in poultry doings, Mr. Henry Stewart sends us the following note:

"A peculiar egg.—I have an egg laid by a seven-year-old Light Brahma hen which has laid over 1,000 eggs. It is one inch long and ¾ of an inch in diameter; it contains another egg and nothing else, as the small inner egg will rattle in the outer shell when it is shaken. How does this come about?"

PROF. PORTER will see by reading Prof. Budd's article on page 429, that the agricultural colleges are even now working in the line he indicated. The junior class at the Iowa College, taking an article in a recent R. N.-Y. for a text, spent a very interesting hour in discussion. Is such a discussion of no practical benefit?

THE bean farmers in Western New York have suffered considerable damage from the continued wet weather. It has been next to impossible to prepare the land properly. During a recent ride through Western New York we noticed hundreds of bean fields in which but little work could be done. The wet weather has also hindered corn.

PRESIDENT CHAMBERLAIN begins an elaborate reply to Professor Porter. The R. N.-Y. is glad to see so much interest taken in this subject. President Chamberlain makes a good point in saying that the agricultural colleges that have brought discredit upon themselves are those that have drifted away from the original purpose of the Morrill bill and taken up the studies that Professor Porter thinks would produce better men.

A FRIEND in Connecticut has started out to raise the largest possible crop of potatoes that can be grown on an acre. He plowed the ground early and applied 3,000 pounds of potato manure broadcast. He planted 52 *bushels* of early Maine potatoes in rows 14 inches apart—the sets 10 inches apart in the rows. The work will all be done by hand and 1,000 pounds more fertilizer will be applied broadcast! Has he overdone the thing?

MR. CROSBY talks sense about calling the cows: see page 428. Last Decoration Day the cows in the R. N.-Y.'s pasture broke through the fence into a neighboring wood. One man rushed into the woods to drive them back. He shouted and yelled, but the more noise he made the deeper the cows went into the wood. Another man, a German, stood at the fence and called pleasantly. Every cow stopped and turned her head to listen. They were easily driven back while he called.

Educational.

"WHAT ARE THE AGRICULTURAL COLLEGES GOOD FOR?"

PRESIDENT W. I. CHAMBERLAIN.

THANKS for the RURAL'S invitation to reply to Professor D. G. Porter's recent article on the above subject. It needs a reply, and yet the task is difficult. Two columns of general, scattering criticisms cannot be met briefly. I do not know Professor Porter or what place he fills, but he seems to me to write without sufficient knowledge or recognition of actual facts, and of the great difficulties to be overcome.

FIRST, ACTUAL FACTS.

In his headings we read "strong tendency to divert from farming promising young men who would otherwise be farmers." But this tendency lies in the college idea, and not in the agricultural-college idea. In the old-time colleges, up to the time the agricultural colleges were opened, about *one-half* of the graduates came from the farms, and less than *one fiftieth* ever returned to the farms. The Massachusetts Agricultural College, quoted by Professor Porter, has by his own figures done *twelve times as well*, and the Michigan Agricultural College has done twice as well as that, sending about half of its graduates and over half of its undergraduates into agricultual and horticultural work of some sort. The tendency or fault lies *in the name, college, and in its traditions.* Some of our agricultural colleges have fought manfully to turn the tide and change the tendency, and should have unstinted praise—not blame—for this good work. Others have yielded to the old college idea and done little for agriculture. They have done exactly as Professor Porter recommends in answer to his own question; "What then ought we to do?"

"First: Turn the agricultural colleges into schools of general culture, assimilating their courses of study largely to the academical courses in regular colleges. If you cannot learn agriculture at a college, there are other things you can learn which will be even more important."

They are the colleges that have done little for agriculture. *They* are the ones that joined the land grant to an existing college or university as a tail to a kite. *They* are the ones that agree with Professor Porter that "it is an easy inference and an easy mistake to suppose, because a law school is good to make lawyers, and a medical school is good to make doctors, that an agricultural school must be good to make farmers. And it is doubtless true that some of our agricultural colleges were founded upon this 'folly,' implied if not expressly stated in the terms of the Morrill Land Grant Act.'

But those colleges that think as Professor Porter does on this point are *not* the ones that, in the opinion of farmers, have done most for agriculture. Does Professor Porter realize just what his words mean? They seem to me to mean *a diversion of trust funds* from their true intent. Each State legislature was by the Morrill Land Grant Act made a trustee. It could *refuse* the trust as founded upon a "folly", but it could not righteously accept the trust and divert the funds to other uses on the ground that the grantor was guilty of a "folly" in specifying what should be done with those funds. Suppose a case: A wills a million dollars to found a Presbyterian Theological Seminary, names B as sole trustee, and dies. Now B may refuse the trust as a "folly" but he *may not* accept the trust, pronounce it "folly" and divert the funds from A's expressed or even "implied" intent. He may not accept the trust and then say: "Christianity is a delusion. Miracles do not happen. Hume and Robert Elsmere have settled that. I will turn this seminary into a school of general scientific culture, assimilating the course of study largely to the courses in our schools of technology. Since Christianity is defunct, and students cannot learn theology at the seminary there are other things they can learn which will be even more important." No, B may not do this; yet this is very nearly what Professor Porter seems to propose, a *diversion of funds* from the admitted intent of the grantor. "If you cannot learn agriculture at a college, there are other things you can learn which will be even more important." But agriculture was one of the things specified in the grant. It may not be suppressed by the trustee.

Again: Professor Porter seems to me to write without sufficient knowledge or recognition of facts in assuming that agriculture is the only thing required by the Morrill Law to be taught in these colleges. "Mechanic Arts and Military Tactics" were by that law placed on the same footing with "Agriculture." This fallacy is quite general and grows in part out of the name "agricultural colleges." This name was assumed for convenience. The entire name was too long and cumbersome—"Agricultural, Mechanical and Military College." "Industrial College," though short, would not do, for the term "industrial" had been degraded and cursed by being applied to penal institutions, "work-schools" or "reform schools" for depraved or criminal youths; as if industry were fit only for the criminal classes; as if useful trades and industries should be taught only as a punishment for crime—in reformatories and penitentiaries!

And so, for convenience, these new colleges were chiefly called "agricultural," omitting two-thirds of their title. And the assumption has been that unless all their students became farmers the colleges were recreant to the trust. Indeed the Michigan Agricultural College, the oldest and one of the best, that did a noble work under a grand man as President, (T. C. Abbott), aided by grand men, as Professors, (Kedzie and Beal and Miles and Fairchild and Cook and others), nevertheless at first yielding to its name and to the idea that it was better to do a part well than the whole less thoroughly, that noble college, I say, for the first 20 years made itself almost wholly agricultural and did little for the "mechanic arts" or "military tactics." Now, however, it is enlarging its work, more in the full spirit of the Morrill Law.

But even the cumbersome name, "Agricultural, Mechanical and Military College," would fail to give the true idea of the Morrill Land Grant Law. It suggests too much of the apprenticeship and trade idea,—of *simply* learning to hoe and harrow, to mold and cast, to hammer and forge, to plane and turn,—and too little of the knowledge of underlying sciences and principles. But the law itself makes prominent the latter idea without neglecting the former. It says explicitly: "The *leading object* shall be, without excluding *other* scientific and classical studies, *and including* military tactics, to teach *such branches of learning as are related to agriculture and the mechanic arts* in order to promote the *liberal and practical* education of the *industrial classes* in the several pursuits and professions of life." (The italics are mine.) The old-time colleges had educated chiefly for law, medicine, theology and literature. The "leading object" of the new Land Grant Colleges was to educate "the industrial classes" for "agriculture and the mechanic arts;" that is, for the various *industries* as distinguished from the learned *professions;*—for the callings that use *hand and brain* as distinguished from those who use the *brain alone*, or almost alone. This seems to me to be a fair interpretation. It was the interpretation put upon the law by my predecessors in the presidency of the Iowa State "Agricultural" College. The results of this idea honestly carried out may be shown from the statistics of the college or of any class. For convenience I quote from page 7 of my own report as president, printed in the "Twelfth Biennial Report of our Trustees, made to the Governor of Iowa," December, 1887.

"The class that graduated this year, November 9, 1887, numbers 43 members, including two gentlemen who took certificates for special work nearly equivalent to the full course, and two who took the second degree. Four were ladies. The *industrial* character of the course of study, and of the atmosphere of the College, can be seen by the occupations in life already chosen by the members of this graduating class, as follows:

Veterinary medicine	12
Agriculture, horticulture and stock breeding	9
Civil engineering	6
Mechanical engineering	3
Practical chemistry	2
Pharmacy	1
Dental science and practice	1
General business management	1
Total in strictly agricultural and industrial callings	35
Not decided	1
Law	3
Teaching (temporarily)	3
Medicine	1
Total in professional callings	7

It has been the custom of certain agricultural writers to name the Agricultural Colleges of Michigan, Kansas, Massachusetts and Mississippi as the only ones that have held faithfully to the agricultural and industrial idea of the Congressional law that gave them their endowments and prescribed the character of the work to be done. Clearly, from the above showing, such writers should enlarge the list so as to include the Iowa State College of Agriculture and Mechanic Arts."

I might add that all our gentlemen students not actually disabled physically, and most of the ladies, have two years' instruction in tactics with military drill from 3¼ to five hours per week; also that any who doubt the industrial character of the callings classed as such above, may perhaps glance over the list with me.

VETERINARY MEDICINE.—Well, about 90 per cent. of our annual agricultural income, and at least 50 per cent. of our total annual income in Iowa, comes from live stock. How can an agricultural college better promote the interests of agriculture than by thoroughly educating veterinary physicians and surgeons to take the place of quacks and save the lives and health of our live domestic animals. The practice is largely surgical. Hand and brain are used. It is industrial. The skilled fingers of one of our senior "vets" tied the artery of a valuable horse for me, severed by barbed wire. He would have bled to death in 15 minutes, if helped only by my clumsy fingers not trained with my mind in a classical college. The next item needs no remark. The two added make 21 in the direction of agriculture, for some of the "vets" went on to stock farms and not into general practice.

CIVIL ENGINEERING.—Is not this industrial? Who build our railways, lay our curves, build our bridges to make life safe? Who span Niagara, and the East river at New York and lay the foundations for the industries and the commerce of the world?

MECHANICAL ENGINEERING.—This is one of the "mechanic arts." What has more blessed the world than the spur given to invention by study of the underlying sciences grasped in the general term "mechanical engineering. "Is not this college worthy of praise rather than of blame for the fact that it turns 35 graduates in a single year into agriculture and the industries and only seven into the old professions, including teaching? Is not that a grand work for "Agriculture and the Mechanic Arts?"

Again, Professor Porter seems not to know or recognize facts when he says: "Now it is a fair presumption that most of the young men intended to become farmers, else why should they go to an agricultural college? And the college instead of helping to make them farmers actually took them away from the farm and sent them into other pursuits." No, they do not all or most of them come intending to become farmers. Fully half or more come headed towards other industrial pursuits. They come in Iowa because they want a collegiate education, and because of the great advantages offered at this college. The endowment is munificent, larger than that of all the other colleges in the State, yielding $60,000 per year. The equipment and apparatus are excellent. The instruction in the sciences that underlie agriculture and all the industrial arts is unsurpassed in the West. Tuition is free, room rent nominal, board at cost and boarding hall and furniture rent free. Then, too, the *home influence* is away from the farm. Sons of wealthy farmers often come here to get a scientific or literary education expressly in order that they may *not* be farmers. I have several in mind. One whose father owned 1,000 acres of excellent land wanted to take a special literary course, skimming what language and literature he could in one year from our whole course, to go elsewhere then and study law. I did not admit him, and he went elsewhere on the same errand. Another boy from a 6,000-acre farm staid here one year and then went to a classical college! Even Professor Porter admits this adverse home influence, even though he charges the chief fault upon the colleges. He says:

"There is indeed one view in which the agricultural colleges are positively detrimental to agriculture. As at present managed, their influence is to take young men away from the farm, who would otherwise have been farmers.

Take a boy from his father's house and farm at the period when his habits and tastes are most rapidly forming; dress him up like a gentleman and send him to college to mingle for three or four years with other boys similarly treated; even in vacation when he comes home as a visitor, coddle him with the notion that he has been studying so hard that he needs all the time for rest and recreation—for that is what vacations are for—and what have you done to make a farmer of him even if he has been spending these three or four years in this gentlemanly way at a so-called agricultural college? Not much surely. But you have done a good deal to give him a disposition to keep up his gentlemanly habits, and to keep away from the farm forever."

Here the home influence is most at fault, not the college, especially if the boy be taught, as Professor Porter teaches elsewhere in this very article, that "apprenticeship and special training are indispensable in other vocations but unnecessary in farming;" that "scientists and specialists confer benefits on agriculture but might make unsuccessful farmers;" that "agricultural papers and reports of agricultural experiment stations tell farmers all they need to know about theoretical and scientific matters appertaining to agriculture;" that the drill in sciences closely related to agriculture is not so valuable even for the farmer "is in no wise comparable to the usual academical course in other colleges." These are the home influences and this the kind of talk that turn the boys away from the farms, and against which the agricultural colleges must struggle, rowing as it were up stream and against wind and tide.

With no discourtesy to Professor Porter, I must be permitted to say that I think such teaching as his does incalculable harm, and that it seems to me agricultural heterodoxy to say that Greek, Latin, Rhetoric and Astronomy are incomparably better drill and foundation for the *farmer's* life work than Geology, Chemistry, Botany, Physiology, Zoology, Principles of Breeding and the like.

I wish to add, too, without discourtesy, that it seems to me well-nigh presumption for any individual to stamp as "folly" the vital idea of the Land Grant Law on which Senator Morrill and his distinguished co-laborers spent so many years of patient study, and which the Old World had been at work on almost a century. President Buchanan *vetoed* a similar bill with the same weak fatuity that let the South secede. The Congress that revised and passed the bill again was the Congress that restored the Union, and as grand a body of men as ever sat in council; and Lincoln signed the bill with the same hand and heart and head that wrote and signed the Emancipation Proclamation! These men had studied well and long the agricultural and technological schools of Europe. They saw the former helping to stop the world's long wail of lost fertility of soil, and desired to bring in that same knowledge before *our* fertile fields were wasted and the same wail was begun here too. They saw the European technological schools sending us engineers and skilled mechanics, and artisans of skill, and artists, and inventors, because our colleges were still pursuing "the usual academic (classical) course," and they determined that we would train such men here and not import them longer. This was their "folly;" and grandly have the results justified the wisdom of it. The Colleges of Agriculture and Mechanic Arts have done a noble work in spite of the encroachments of the old college and university idea, which they were founded to correct and supplement. They have driven the old colleges into science with the laboratory methods more than the latter have drawn them into classics and literature. Latin and Greek are sickly, exotic plants even in those Land Grant colleges that are most impressed with the university idea.

Another article will notice some of the real difficulties which I do not think Professor Porter fully appreciates, and will also consider the wisdom of the remedies proposed by him.

Iowa Agricultural College, Ames, Iowa.

P. S.—I notice by last week's RURAL, received since the above was written, that Professor Porter claims to have used the word "fallacy" instead of "folly" of the Morrill Act. Well the "fallacy," stated as a syllogism, is as follows:

Major premise: All callings based on knowledge of scientific principles and on practice in detail are more successfully followed with such knowledge and practice than without. Minor premise: Agriculture is such a calling. Conclusion: Therefore agriculture, etc. Now, which premise does Professor Porter deny?

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

THERE is frying and frying. One old housekeeper declares that the reason why this mode of cooking is regarded with so much contempt is because so few women know how to fry. They usually set the pan on the stove, throw in some fat, and while it melts put into the greasy mess whatever they wish to cook. Then it is allowed to frizzle until it is done—and a barbarous mode of cooking this is. Properly, if such meat as steaks or chops should be cooked in the frying pan, that utensil should first be heated until it is *thoroughly* hot; then it should be rubbed over with fat just to keep the meat from sticking. When this is done, the outer surface of the meat becomes hardened at once, so that there is no escape of juice, nor is there any possibility of its becoming soggy or soaked with fat. This mode of cooking is sometimes called a "Philadelphia broil."

ACTUAL frying is not at all objectionable, nor especially indigestible when rightly done. In such case the pan should not be used, but a saucepan, and the article fried should be put into boiling fat, like doughnuts. If there is not enough fat for the food to float in, or if it is not at the boiling point, the result will be unsatisfactory. Fish-balls, croquettes, rissoles and fritters are all best when cooked in this way. It is not an extravagance, for the fat can be used over several times—so long, in fact, as it is sweet. One should keep in separate vessels the fat used for frying fish, meat or fritters.

* * *

SOMEHOW, we can't help thinking that many tired housewives tire themselves chiefly with works of supererogation. There is so much unnecessary work, on which depends little real comfort. Take, for example, the subject of pie. Pie-making is not easy work—there is all the tedious standing while mixing and rolling crust, and the trouble of preparing the fruit. It is a decided bother all round, and yet so many seem to think that fruit has but one mission in life, and that is to fill pies. We find that fresh or stewed fruit, with some sort of nice crackers, makes a far better dessert than pie. There can be no question of its greater wholesomeness, and it is liked into the bargain.

* *

IF we could only find out the real truth, we should discover that many a woman does more than she ought—more than she is fit for—merely because she is afraid to give in. She fears being accused of not being as smart as her neighbors. We certainly ought not to mind what the world thinks, but we usually do. It is a thousand pities that any one, knowing her own duty, and doing it should fear lest it should not be plain to her friends. It is so easy to be misjudged, but after all, that is an imaginary evil when compared with the real evils of pain and weariness that follow over-work.

OUTINGS IN NEW ENGLAND.

XI.

MARY WAGER FISHER.

OUR first halt, after leaving Oswego for the New England sea coast, was at North Adams, in Massachusetts. The laddie desired to see the Hoosack Tunnel, and so, in mapping out our route of travel, we arranged to go by the railroad which takes its name from this tunnel and passes through it, and no one day's ride by rail could well be lovelier, than that between Oswego and any point in the charming Deerfield Valley in the Old Bay State. One feature of the East that invariably surprises a Westerner, is the amount of uncultivated land. The man who has been born and reared in the West naturally thinks of the East as being crowded with people, and having every inch of land cultivated to the highest degree. What else so reasonably explains the large and constant migration to the West? But all throughout New York State, even, there is yet much uncultivated land and much that is poorly tilled. From Oswego on to Syracuse the farming was ordinary, although the country itself is beautifully rolling and everywhere glorified by elm trees. One of the pretty little lakes that we passed, is called Como, and another, which was better named, is called Onondaga.

For some time we followed the slender stream of the Mohawk, with its willow-planted shore, and lying on a friendly level with the surrounding land, and the lines of a song I heard in my childhood came into my mind, "Oh sweet is the vale where the Mohawk gently glides," etc. We noted stone as well as stump fences, both of which have a picturesque and substantial look of their own, that is a relief to the trim airiness of the fences of wire. Whatever objections may be raised against fences, they give a certain boundary and outline to the country, that are restful to the eye, and to the mind, and when they are built of material native to the region, as of stones or rails, they add to, rather than detract from, the general landscape effect. So much can be done with stones, that people who live where the soil is free from them, lose one of the most satisfactory resources in nature, and I know of no other one thing, that is not to be counted among the necessities, that can be made to yield more pleasure than a garden wall with a sunny exposure. So many things can be trained on it, and the spring time is fully a fortnight earlier in its sunny warmth, and better than elsewhere. The walled gardens of Europe, while they shut out public view, are within, veritable paradises. A home, with its grounds, well fenced in looks far more home-like, secure, and private, than any fenceless abode can be made to look, and the commonest fence of rough, unpainted boards can be made with running roses and vines, an inclosure fit for a king.

Eastward from Troy the fields were better tilled, many were sowed with buckwheat, and in bloom—there is rarely a lovelier sight. It is a curious fact that so many country people who easily enough recognize a field of buckwheat in bloom, fail to recognize an isolated blossom. I once had a flower-stand at a fair, and as Anaximander had a quantity of buckwheat in bloom I cut of it plentifully, using the flowers in bouquets and in vases. Every one commented on them, asking what the rare flower was, and when the reply invariably came "Fagopyrum," nobody seemed any the wiser. By and by we began to catch glimpses of the Hudson, and having an hour or two to wait at Albany, Anaximander went to see the Capitol, and returned much disappointed, finding no end of fault with the shabby construction of a building upon which such lavish expenditure had been made. In getting into Massachusetts we passed through a corner of Vermont, and the laddie thought if the States were of different colors, as they are on the maps in the Atlas, it would be very convenient for travelers. North Adams itself is not far from the Vermont line, a town high up in the mountains with mountains all around it and the spreading city climbing up their sides. One of the favorite drives led to a point not far from the town which was said to be the highest point in the State, and from which five States could be seen. One member of our little party became slightly ill, and for a remedy Anaximander asked at a drug store for blackberry brandy, and he had quite a history in getting some because of the regulations imposed upon apothecaries in Massachusetts in regard to selling "intoxicating beverages." After considerable red tape, his name, residence, the amount purchased, and the purpose for which it was intended by the buyer, were written in a book, and he was required to put his signature to the statement.

We were greatly pleased with the hotel in which we were for several days lodged. All the dining-room waiters were young women, very neat in their dress, hair and petticoats, both worn short, plain skirts, erect figures, light in step, and no clatter of dishes. The landlord said that he made it a special feature of his hotel that the dining-room service should be as expeditious and noiseless as possible. The town is characteristically New England—handsome churches, a public library, green grass a-plenty, and well cared for trees. The laddie was not content with the prospect before him of riding through the tunnel, but he must *walk* a little way in it, but when he found that it was the longest driven railway tunnel in the country, being four miles more or less in length, he lost his appetite for a longer promenade. The entrance to it is very pretty, but the 10 minutes required to pass through it by rail seemed almost interminable and intolerable. It was a great piece of engineering to dig from opposite sides of the mountain in such a way that the two tunnels should lead directly into each other. A graphic account of the construction of this tunnel through the Hoosac mountains published in the Atlantic Monthly several years ago, had made such an impression upon the laddie's mind that he had never forgotten it, and it was this that endowed the tunnel with so much interest to us. All through the Deerfield and Connecticut valleys the scenery was enchanting, rivers, waterfalls, mountains, the beautiful trees, the lichen on fences and walls, the prim, clean-looking white houses, the old-fashioned lumbering stage coaches—a glorious ride, which, however, landed us in Boston in a pouring rain! We went to a near-at-hand, palatial-looking hotel, where we ordered a room away from the street in order to secure quiet, and were kept awake nearly the whole night through, by the clatter of servants in the court. The atmosphere after the rain was of extreme sultriness, which seemed to have bred innumerable mosquitoes, which swarmed through our open windows and their buzzing and biting, completed the pandemonium. The morning, however, dawned fine and clear, and we took an early train for the north shore.

THE DEMON OF DISCONTENT.

REV. CHARLES T. WHITE.

THERE is a kind of discontent, which works our good in the end. It is the handmaid of ambition, and prudent ambition is always praiseworthy. We are each in duty bound to make the most of ourselves, and our abilities. To confine our activities within a narrow circle, when a little effort on our part opens before us an ever-widening circle of success and usefulness is traitorous to our Creator. It is the old story repeated of burying in the earth the talent which God has given us. It is well-nigh criminal to withold from our fellowmen the benefits we might have conferred upon them.

The great ones of earth have risen from obscurity to honor and fame by reason of this spirit of discontent. There is need of caution here, however, lest an overestimate of our own abilities, or a wrong estimate of our fitness for some untried task lead us into serious error. There is no end to the measuring line of our fond self-conceit. Put the youth in his teens through a year's academic schooling, let him weigh his petty acquirements in balances of his own construction, and if he be of hopeful temperament, he straightway imagines himself an embryo Shakespeare, or perchance an Edison in roundabouts.

The young miss at boarding school rattles off sentimental crudities, and in view thereof, deems herself an apt pupil of the immortal nine. These youthful conceits are not without purpose. Despise not the roseate tints of the morning sky, though they fade into more sombre hues after! They have a brightness all their own, and gladden the eyes and heart for a season. The ideal, which the imagination creates in cold outline, the work of a litetime sometimes endows with life and beauty. Oftener we gaze too long, idly upon what must ever be unreal, and the imagined grandeur of what we might have been pursues us through life like an avenging Nemesis, stealing the gladness out of our lives, and making us to be dreamers rather than willing workers. Alas, how much of this restless, aimless discontent there is in the human heart! How many of vain wishes and desires are continually welling up from the hidden depths of the soul, only to be dissipated into nothingness, like the air bubbles, which burst upon the tranquil surface of the water! We leave the rank weeds growing in the corn-field, and wish we might have been princes. We dabble our hands languidly in greasy dishwater, and envy the lady of wealth, whose "coach and four" swept past the kitchen window. We drop the needle from tired fingers, and see in retrospect the shapely hand, which might have wielded a poet's pen or an artist's brush. Ah, and "what fools we mortals be!"

Is there not enough of the bitter in life already, that we must needs import from no man's land fresh supplies of worm-wood and gall, therewith to make Marah, like the sweet draughts of nectar, which we might else drink unalloyed? Think not yourself alone the imagined victim of a hard fate! This foul folly of discontent is widespread as the race. No doubt the crowned king in his weariness of court bustle, and political intrigue is longing this moment for the plow boy's noontide siesta under the grateful shade of the spreading maple, and perchance the jewel-bedecked heiress of a kingdom would not scruple to exchange her hateful finery for the torn calico gown and the bare brown feet of the country maiden, who picks whortleberries on the hillside. The farmer, broiling in a July sun, pauses a moment in his toil to watch the village doctor driving by in his carriage, and mutters something about a "mighty easy time." The physician roused at midnight, rides six miles in a driving storm, with the thermometer dropping into the twenties, and vows between his chattering teeth that the life of a dog is preferable. And so the story goes from one end of the world to the other. The clerk envies the employer's capital and the employer envies the clerk's exemption from the harassing cares of business. The tired student gazes from the windows of his musty attic upon the merry hay-makers, and would fain exchange a page of hard-acquired Greek for an hour of freedom, and care-free toil in the fragrant meadows. The farmer-lad driving home the cows from pasture at milking time meets the high-school professor on a solitary ramble, and remembers with shame-facedness that his trousers are ragged and his last summer straw hat sadly battered.

Surely could some mighty magician wave his wand over the heads of us poor grumbling mortals, and cry to all *Presto* change, ah then, how would smiles, for the moment at least, transform the faces of men! But not for long. In a month, we would be seeking the magical power, which might change us back to our old selves, and restore to us the old familiar surroundings, in which beforetime the demon of discontent permitted us so little pleasure. I wonder sometimes, when I hear women talk about the future emancipation of their sex, if they rightly realize the nature of the coming slavery. Emancipation indeed! Some of our farmers' wives, and daughters even have caught the infection, and loathing the daisies, and the buttercups, and the lilac's perfume, and the music of birds and bees, and the home duties, and the home peace, are longing for liberty. Liberty forsooth, and where will you find it, if not in the heart of God's beautiful nature, and under the star-lit sky, and in the genial radiance of the fireside? Man, (and woman too,) is nearest ideal freedom, as he is nearest the place where God places him, and the dwelling place of sinless man, let us remember, was a garden. To be sure there were no thorns and thistles there, no hard, grinding toil, no weariness and weakness, no trembling hands and aching hearts, but despite all, there is yet something of the Eden freshness upon the face of nature, and the soul is stronger and purer for its constant contact with these reminders of its innocence. There are thousands of men doubtless, who would gladly better their coveted "rights" for a few hours of sweet undisturbed repose upon the breast of nature. The demon of discontent, fair ladies, invades the heart of even that creature of rare opportunities—man. Feminine aspirants, despair not to seat yourselves upon the Judicial bench, to throng the halls of assembly, and to besiege the presidential chair for appointments! Come, and welcome to the stifling court-room, and dingy office, while we lawyers, senators, judges will scuttle away in haste to the country home for a breath of pure air, and a drink of cold water from the "old oaken bucket," and a sight of the grand old mountains, and the fresh green fields.

GOLDEN GRAINS.

THE ATLANTA CONSTITUTION reminds its readers that genius is a dazzling thing, but it won't plod. Talent is forced to plod or get left, and so, with the instinct of self-preservation, it generally plods. Genius starts out a petted darling, and ends by dodging the bailiffs and dying in the poorhouse, while talent raises a monument in its honor and pays the bill out of its well-filled pocket.....

SHALL I ever forget my early home? asks Talmage. Yes, when the flower forgets the sun that warmed it; yes, when the mariner forgets the star that guided him; yes, when love has gone out on the heart's altar, and memory has emptied its urn into forgetfulness—then, home of my childhood, will I forget thee.....

IT was Faber who said let us serve God in the sunshine, while He makes the sun shine. We shall then serve Him all the better in the dark when He sends the darkness. The darkness is sure to come. Only let our light be God's light, and our darkness God's darkness and we shall be safe at home when the great nightfall comes.....

COTTON MATHER says: "The ability to do good in any case imposes an obligation to do it." The apostle James says: "Therefore to him that knoweth to do good, and doeth it not, to him it is sin." Paul says: "As we have therefore opportunity, let us do good unto all men, especially unto them who are of the household of faith." The Independent adds not to do good, as and when we have the opportunity, is sin. There is a large amount of this form of sinning among men.....

A. P. GORDEN says that sorrow is only one of the lower notes in the oratorio of our blessedness.....

IN matters of conscience first thoughts are best; in matters of prudence last thoughts are best, says Dr. Hall.....

> Dear ties of mutual succor bind
> The children of our feeble race:
> And if our brethren were not kind,
> This earth were but a weary place.
> —*Bryant.*

RUSKIN says that though you may have known clever men who were indolent, you never knew a great man who was so; and when he hears a young man spoken of as giving promise of great genius, the first question he asks about him is always: "Does he work?"..

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOW.

HOW some people manage to concoct the "messes" they make from good materials is a standing mystery to me! Take

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria

ham and eggs, for instance. How often we see the dish served with the ham dried and tough till it resembles shoe leather more than anything else, and the eggs done till they look like India rubber; yet what is nicer for breakfast than a good dish of ham and eggs? There are several ways of preparing this, but to my mind the nicest ways are as follows: Cut the ham in rather thin slices, lay in hot water for 10 or 15 minutes, then wipe with a dry towel, and broil in a double wire broiler over a clear fire. Lay on a hot dish; over this lay your eggs nicely poached; garnish with parsley.

Another way of cooking ham and eggs, which, to me, is always a relish is as follows:

Cut half a pound of lean boiled ham (the proportion must be arranged to suit the size of the family) into little squares, put in a pan with an ounce of fresh butter and eight or 10 eggs, a pinch of pepper, (and if you like, a table-spoonful of chopped chives), place on the fire and stir continually till the eggs are done enough. (They should not be very stiff) Serve on buttered toast.

Beef-steak is another thing that is abominable unless properly cooked. Steak should be broiled. Place it in an open wire broiler, and broil over a clear, quick fire. Turn repeatedly so that one side will not be done too quickly for the other. Place on a hot platter, add pepper and salt, dot with good butter. The second cut of the round, if cooked in the following manner, makes a very good dish. Have the steak about an inch and a-half thick. Take the point of a sharp knife and cut little gashes on the surface. In these interstices stick small pieces of the beef fat—(this prevents the meat from drying or scorching.) Place in a broiler, and broil over a clear, hot fire; add butter, pepper and salt when taken up.

The potato is another abused article of food. The tubers should be taken out of the water in which they are boiled as soon as they are done. Then hold over the fire till dry—this makes them mealy. If you want them mashed, break them up with a fork, add a little milk and salt; beat till they are creamy and light. Place in a dish, cut a little depression in the top, add a generous lump of butter. Place in a *hot* oven for a few moments if possible, as this will make them a lovely golden brown.

Never draw the tea till you are about to add the finishing touches to the tea-table, as it becomes bitter and loses its delicate aroma if allowed to stand.

The best coffee is made in a French coffee-pot (which has a double compartment, or a bag for holding the coffee grounds.) But a very good pot of coffee may be made if the following directions are carried out to the letter. Have the pot thoroughly clean from all dregs. Place the required amount of coffee in the pot. Add a portion of a raw egg. Mix thoroughly. Then pour *boiling* water over this, set on the fire and let it come to a boil. It is not necessary to have the coffee boil, and boil, as some people think, for if it does all the strength goes up the chimney, and it gets thick and muddy.

DORA HARVEY VROOMAN.

AROUND THE HOUSE.

ANNIE L. JACK.

IT seemed strange to have the Wreath or Cinnamon roses blooming in May; but June is more than half over and they are yet only opening fully. The hot wave that came over the land last month touched even here, and everything came forward with magical haste. In the garden we felt like saying to the violets: "Stay, O stay a little while!" When the lilacs bloomed and faded, and the apple trees with their pink and white beauty "came and went," I longed to be where they would not fade so soon, "and never withering flowers" kept constantly coming to my mind. Then a friend from British Columbia came to visit me, and she said the flowers stayed there quite a long while, but they were a long time coming out: I thought how delightful that would be.

"But," she said, "the asparagus grows so slowly that it is quite tough before it is ready and there are no green meadows."

"O" I said. "I should not like to live there—no clover blooms, no restful green for the eyes." And so every life has some compensation, every loss has a gain, if only one could be content.

Meanwhile the spring flowers are only a memory and the roses are here. It has been a hard winter. Mabel Morrison, the fair sister of our Baroness Rothschild, with others less noticed stands, black and dead in our rose garden; but we fight along, replace and try again. Grapes, too, are "sick," as the guidmon says. White grapes, without exception and no matter where they are growing, prove tenderer than black.

It is a sad thing to go out the first fine spring morning and find so many favorites dead; but perhaps it is good for one or we should forget that we too are mortal, and grow too proud of our successes. In the house all is in summer quiet and freshness. There is a smell of linseed oil lingering about the floors and the sweet, faint odor of shellac; but the June roses find us ready for them, and for their contemporary, the strawberry: for I never can in any way disassociate them.

Our neighbor has been troubled with moths in her carpets and keeps her house redolent with camphor tar, the smell of which is offensive to many nostrils. I suggested to her a thought of my own that came from observing her daughter putting down a carpet before the floor was dry, and I fully believe this to be the cause of the moths. Floors should be thoroughly dried and if anything is put under the carpets, a few branches of red cedar picked off the stems and smoothly strewn over the floor are pleasant and effectual for keeping away the insects that seem to abound everywhere. This is for any locality where druggists are not plentiful.

STRAY THOUGHTS.

"OF all sad words of tongue or pen, the saddest are these, it might have been."

How utterly useless and wrong it is to dwell on that idea! What *is*, is for our best good, and we need waste no time speculating on "might-have-beens."

We all may be what we "might have been." How much better this second theory. We might have been honest and faithful, pure and just. We might have been found always doing our duty, always obedient, always ruling our own spirit, always careful to choose our words well; and, surely, if we have not "been," while we live we have opportunity to "be."

As for happiness, it comes only from a consciousness of well-doing. Fleeting pleasure we may enjoy for a short time; but we need look back with no regret to a happy "might have been" unless we could picture ourselves doing right.

If you wish to knit woolen yarn that has been raveled, you can straighten it in this way: wind it tightly around a clean board, wet it thoroughly, and let it dry before taking it off the board.

Last summer we had more red currants than we could well use, so we canned some juice. This spring we have made excellent jelly with it.

The following is our *best* way of cooking pie-plant. Wash well, and cut in half-inch pieces. Sprinkle over it a small spoonful of saleratus, and pour on sufficient boiling water to cover it. Let stand one minute, stir well, and drain in a colander. Have ready a thick sirup, made of granulated sugar, pour in the well-drained pie-plant, and boil slowly till it is tender, but not broken. Very nice.

Here is a German dish: Into two table-spoonfuls of sweet milk break two eggs. Stir in all the flour you can, and knead well. Roll very thin, cover with flour, begin at one side and roll it up. With a thin, sharp knife, cut thin, round slices, which should unroll, making long threads of tough dough. Add flour to these, and continue till the long roll lies before you a pile of these long threads. Have boiling water in a kettle, and drop them slowly in, stirring carefully. Add salt and pepper; boil 10 minutes. Add a generous lump of butter, and a quart of rich, creamy milk.

MRS. L. H. NILES.

THE following hints from Harper's Bazar as to what is worn will, we know, be appreciated by the woman who makes her own dresses and trims her own hats.

AN all-black lace dress has Marquise net with large-flowered design, draped over black satin to form a Greek apron in front, caught up on the right but with the left side full and straight, bordered with moiré ribbons. Two flounces of lace are placed in jabots down the middle of the back. A ladder of four bows of moiré ribbon is set down the left side, and two flat bands of wider ribbon are down the back outside the jabots.

THE fashionable corsage is slightly elongated, being neither a round waist nor a basque, but something between these, extending just beyond the waist line, and either slightly pointed or else broadly rounded in front and back, the fulness which is shirred on the shoulders being flattened there in small plaits. If the short-waisted Empire effect is desired, a wide sash is set on a waist made as described, but if the natural length of waist is allowed to be seen, a narrower ribbon sash, quite straight or else slightly twisted, is set permanently on the belt of the skirt, and the skirt is put on last (after the bodice has been fastened), the join between waist and skirt being hidden by the belt.

SKIRTS of walking dresses, in order to be stylish, are made quite long, but this is an untidy and inconvenient fashion that cannot be commended. The perfectly straight skirts, with plaits of varied width, or shirred all around the top, or else those with slight drapery on each hip, are used for both elaborate and simple dresses. The foot-plaiting is no longer generally used on skirts, but the Empire flounce of lace or of the fabric, gathered, or else cut in tabs to fall on a lace flounce, is a fashionable finish for the front and sides of straight skirts. Pretty little butterfly bows almost meeting to form a ruche are made of ribbon, and set at the top of the square-cornered tabs that fall in a frill below.

FULL sleeves are so varied in shape that some pattern can be found to suit any figure; for instance, they can be set high on the shoulder seams for those whose shoulders are too broad and square, or they can be made to project outward if the shoulders are too narrow; they can be tucked flatly, if the top of the arm is too large, or they can be caught in loose folds around arms that are too slender. The moderately large mutton-leg sleeves, full above the elbows and slender below, are found to be most generally becoming. All such sleeves are worn extremely long, covering the wrists entirely, and are very simply finished at the ends. With very sloping shoulders, a good effect is given by adding a standing ruffle of the material, doubled just across the top of the arm-holes, two inches wide in the middle, tapering to nothing on the sides. Coat sleeves are still preferred for many dresses, but even these are now enlarged at the top, either merely raised slightly above the arm-holes, or else with the outside material lengthened and widened beyond the lining, and caught there in slight folds that are broad or high, as best suits the wearer.

SAILOR hats are again in great favor, not merely for yachting (where they are worn with the simplest band around the crown), but for country wear, with morning and afternoon toilettes. As their severe shape, with slight trimming, is not becoming to all faces, the milliners are trimming them much more elaborately, not with loops up the front, as they were worn last year, but with loops and wings coming from the back pointing forward far over the crown, with a broad sash ribbon that lies flat in front, but is gathered in high pointed ends, like a jabot, at the back. Still another fancy puts flowers, especially small white flowers, all around the crown instead of a band, and loops of white thick faille ribbon are set to point upward on the top of the low crown. Colored straw sailor hats are particularly stylish when trimmed with black; as, for instance, an old-rose straw hat has the back of the brim caught against the crown by loops of black moiré ribbon, which point quite high, and hold a blackbird poised as if flying downward. The same ribbon is twisted around the crown, and an inch-wide band of black velvet is set under the brim as a facing, but does not cover all the straw.

For Women

Of delicate constitution, no better medicine can be recommended than

AYER'S Sarsaparilla.

It is highly concentrated, economical, safe, and pleasant to to take.

"This is to certify that after having been sick for twelve years with kidney disease and general debility, and having been treated by several physicians without relief, I am now better in every respect, and think I am nearly well, having taken seven bottles of Ayer's Sarsaparilla."—Maria Ludwigson, Albert Lea, Minnesota.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.

Price, $1; six, $5. Worth $5 a bottle.

BEECHAM'S PILLS
(THE GREAT ENGLISH REMEDY.)
Cure BILLIOUS and Nervous ILLS.
25cts. a Box.
OF ALL DRUGGISTS.

Ever Dye?

News of the Week.

HOME NEWS.

SATURDAY, June 15, 1889.

A yellow fever scare in Brooklyn! Dr. Duncan, surgeon of the Pacific Mail Steamer Colon, was sick on her arrival here a week ago. He was taken to his home in the City of Churches where his disease was diagnosed as yellow jack. He has just been transported to quarantine station, and there the doctors are disputing as to whether the trouble is yellow or bilious remittent fever. The people in the neighborhood of his place in Brooklyn are still anxious..... ..Thursday the venerable Simon Cameron was stricken with paralysis at his home at Donegal Springs, Pa., and his condition is critical. This is the second stroke .... .. Jay Gould is soon going to the Paris Exposition,.....Bonham, Texas, has struck oil.....The Kearsage is on her way to Porte au Prince, Hayti, where Legitime is besieged by Hippolyte. Just 25 years ago she sent the Alabama to Davy Jones's locker. . Tuesday last Pennsylvania voted on a Prohibitory amendment to the State Constitution, and returns, nearly complete, from all parts of the State, give the majority against it at 185,173. This overwhelming defeat is a sad setback to the Prohibitory movement. Both the great parties will pay little attention to it in the next Presidential campaign. A suffrage amendment repealing the poll tax of 25 cents per head for those who paid no other State tax, before they could vote, was defeated by 225,729. The farmers, as a body, voted against the repeal of the law.....Three years ago Rhode Island's vote for a Prohibitory amendment to the constitution stood 15,113 in favor and 9,230 against. Last Tuesday Little Rhody, by a vote of 28,449 to 9,853, decided to repeal this amendment. Three-fifths of the votes cast were necessary to secure the repeal of the law—but there were 5,469 in excess of that majority. All along there has been an utter disregard of the law, which so disgusted the people that they have wiped it out by 14,000 more votes than the number that enacted it..... It has just been discovered that the omission of one word in engrossing the Weldon Extradition Bill lately passed by the Canadian Parliament has made it retroactive, contrary to the intention of the legislature. The bill originally stood: "This act shall only apply to any crime mentioned in the schedule, committed after the coming into force of the act." In copying it, the word "only" was intentionally or unintentionally omitted, and the Minister of Justice says this makes it apply to all boodlers, embezzlers, and other criminals who have hitherto found a comfortable and safe refuge in the Dominion..... ....The trustees of Miami University, at Oxford, Ohio, Thursday conferred the degree of LL. D. upon President Harrison, Secretary of the Interior Noble, and John W. Herron, all alumni of the college..... Prof. E Benjamin Andrews of Cornell University, formerly of Brown University and a Brown alumnus, was unanimously elected President of Brown University, Thursday, vice Dr. E. G. Robinson, resigned ..... Great destitution amounting in some instances to starvation, exists among the locked-out miners in Illinois and Indiana.....Ex-Governor Hartranft of Pennsylvania has been appointed a member of the Cherokee Commission ..... Gen. A. C. Meyers, who was Quartermaster General of the Confederate Army, died at Washington, D. C., Thursday. .... Indiana's Supreme Court has decided that shaving is not a necessity.....Indications point to the nomination by the Ohio Republicans of Governor Foraker for another term.....Having concluded that the Valkyrie will have at least a fighting chance, her owner, Lord Dunraven, has finally concluded to sail her against the fleetest American yacht for the America Cup. The Volunteer, last year's victor, will probably be chosen as their champion by "our side."..... W. E. Howard, one of the "electric" sugar swindlers, has been promptly found guilty by a jury in this city, and awaits sentence. The rest of the gang now in the Tombs will be promptly brought to trial .....A Local Option bill has passed the Michigan Legislature. The desire for Local Option and High License laws is being greatly strengthened everywhere by the current setting in strongly against Prohibition. The straight-out Prohibitionists, however, will carry on the fight all the harder.....There sailed from New York for Liverpool on board the Bothnia, Thursday, 300 delegates to the World's Sunday-school Convention, which meets in London on July 2..... Contributions to the Conemaugh Valley relief fund continue at the rate of about $25,000 a day from all sources. Remittances from foreign countries as far off as China and Australia, and also from theatrical benefits given especially for the purpose, are included. Work would be vigorously prosecuted at Johnstown and the other devastated places were it not that a strike among the workmen hampers operations. They want more pay and better rations. The banks have advanced the $1,000,000 to Gov. Beaver without a guarantee for its return by the legislature, and from 75 to 80 per cent. of the amount will be used in clearing up the valley, and the rest at Lockhaven, Williamsport and other places ravaged by floods. Those in a position to judge, say the public funds are being wisely expended, and that all that may be given will be needed. The disaster instead of diminishing business in Pittsburg, Philadelphia and other markets, has made it specially lively, as heavy orders for all sorts of goods have been pouring in from local merchants, the Charity Committee and the State authorities.. ....Three hundred and forty-five Mormon proselytes landed at Castle Garden Thursday. .....The University Board of Madison University, Hamilton, N. Y., have unanimously voted to change the name of the institution to Colgate University in honor of the Colgate family, and especially of James B. and Samuel Colgate, who have been great benefactors of the institution. From the first the family has given it over $500,000. Banker James B. lately built an extension at a cost of $150,000, and merchant Samuel is now building another to cost $100,000. This Baptist University, now over 65 years old, will begin its new career with an endowment of $1,200,000 in addition to its educational plant, grounds and buildings..... The Cronin murder case in Chicago, from a tragedy has almost become a farce. The two men arrested here for complicity in the crime have been released, as all formalities for extradition had been neglected, and three persons sent on from the Windy City to identify them as persons connected with the horror, failed to do so. It has been found advisable to keep all Irish policemen off the case, and it is said all who are members of the Clan-na-Gael in Chicago will be dismissed from the force. Dan Coughlin, a detective, now in jail, is one of the men chiefly implicated. Martin Burke, a fugitive from Chicago, has been arrested, as one of the chief actors, at Winnipeg, Canada, and identified by a Chicago police officer. Chief of Police Hubbard is "exultant over this fact" and says he expects to have the whole mystery cleared up soon. The Canadians will be only too glad to surrender Burke as the Clan-na-Gael is detested by all loyal people across the border. Alexander Sullivan, ex-president of the Land League, has been released on $20,000 bail, and the general opinion is that his shrewdness, if not his conscience, kept him free from any provable complicity in the crime. Many other arrests are expected..... John W. Bardsley, who brought the first English sparrows to America, died at his home in Germantown, Pa., on June 17.—No talk of a public monument to his memory.... ....A Chippewa Indian war scare in Minnesota drew several companies of United States troops on a wild goose chase to the Mille Lacs reservation where 70 Scandinavian squatters were badly frightened. A drunken Indian had wounded one of them—hence all the hubbub..... ..... While the rainfall in the East in May was the greatest in the records of the Signal Service, the rainfall hitherto in June has been the heaviest all over the country since 1880. Last Sunday was the wettest kind of a day nearly all over the country. Uniontown, Kansas, a place of 600 inhabitants, was swept away by a flood caused by heavy rain and the bursting of a dam; Augusta suffered also from a cloud burst, and Fort Scott "had the heaviest rain in 30 years." All that section of the country suffered severely. "The heaviest rain for years," did a world of mischief in the country about Abington, Illinois. "The most terrible rain storm of recent years" caused much loss and more dismay in West Virginia; and the Shenandoah Valley about Martinsburg, Va., was swept by a downpour. Western New York, especially Chemung county had a pluvial visitation almost as disastrous as that of a fortnight ago ..... The price of castor oil has been enormously increased by the "trust" controlling its production and sale.....The ice trust in this city has doubled the price of ice..... New Hampshire has elected W. E. Chandler to enliven the United States Senate for a term of six years .....Last year 45,000,000 pounds of oleomargarine were made in the United States against 30,000,000 in the previous year. The sales kept pace with the manufacture.....A handsome granite monument has been placed on the grave of Edward Payson Roe, the novelist, clergyman and horticulturist, in the village cemetery at Cornwall on-the-Hudson, New York..... .... Last Saturday night Governor Hill, of this State, completed his labors on the 451 bills left on his hands at the adjournment of the legislature. He witheld his approval from 166. This year he approved, in all, 570 bills against 586 last year.....General Miles telegraphs that the reports of Indian massacres in Sonora, Mexico, are unfounded..... Canadian authorities are urging upon the British Government the necessity of an early settlement of the Behring Sea trouble ..... John Gilbert, the veteran actor and "born" gentleman, is dead..... ..Ex-Commander-in-Chief Fairchild, of the G. A. R., has been appointed a member of the Cherokee Commission, which is persuading the Indians to cede some of their lands to the United States, for the formation of the proposed Oklahoma Territory .....The Sioux Commissioners at the North are having a hard time in trying to induce the Indians to sign the treaty ceding 11,000,000 acres. His bitter opposition to the measure has restored Sitting Bull to health enough to fight against it..... Tuesday Mr. Belmont's four-year-old gelding, Raceland, won the Suburban Handicap, at Sheepshead Bay, near this city, the greatest racing event of the season. Purse $10,000; jockey "Snapper" Garrison; distance, 1¼ mile; time, 2.09 4-5. He was the general favorite .....Wednesday four persons were killed and several others injured because an engineer had orders to make up for lost time, and ran his engine at the rate of 60 miles an hour round a sharp, sloping curve on the Panhandle railroad, three miles east of Steubenville, Ohio. The rear cars were whipped off the track and utterly wrecked on a 25-foot embankment.....At Columbia College, in this city, 170 doctors were graduated the other day. The German government is contemplating strong measures to prevent so many young men from studying to be doctors, by withdrawing public aid to tuition, because the great surplus of the profession begets much shiftlessness, idleness, trickery and scandal.....Nebraska has 5,031 miles of railroad the assessed valuation of which is $29,584,325.....The Fairbank Canning Company, of Chicago, has purchased the entire plant of the East St. Louis Dressed Beef Company for $500,000. It is expected that from 1,000 to 1,500 beeves per day will be killed by the new owners..... .....

Where Simplicity Avails.

Before adding another line we wish to state that it is Compound Oxygen, of which we would speak. Having thus admitted our purpose we call attention briefly to what the voice of experience has to say:

MARION, Va., August 27, 1886.

"I am happy to report my mother now in her 75th year, much improved in health since using Compound Oxygen."

MRS. VIRGINIA B. HALLER.

NEWPORT, R. I., June 13, 1887.

"No one seems to appreciate the blessing of getting out more than I do. I also realize had it not been for the Compound Oxygen I would not have been here to enjoy this blessing." LYDIA B. CHACE.

We publish a brochure of 200 pages, regarding the effects of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, June 22, 1889.

IN England the Parnellite-Times case is still dragging its slow length along.....The Cronin murder is the very sweetest sort of "nuts" to the Times and all the Anti-Home-Rulers. They chuckle over the Kilkenny cat fight between the rival factions of the Clan-na-Gael and over the "*imperium in imperio*" which the disclosures reveal as existing in this country. Since the Phœnix Park assassination of Lord Cavendish and Secretary Burke, nothing has so injured the cause of Irish Home Rule as the brutal Chicago murder. Every revelation of the deeds, methods and motives of this dark lantern organization is eagerly recorded for subsequent use against the cause advocated by the Parnellites. There's no doubt that British antagonistic influences of all kinds are busily at work in stimulating, suppressing or diverting the investigation .. A strike among sailors, firemen, oilers and coal-passers in Liverpool, London, Glasgow, Belfast and the other chief ports in the United Kingdom, has greatly hampered the "stevedoring" and departure of ocean steamers and other vessels for the last fortnight. No other class, even among the "pauper labor" of the Old World, receive such small wages and such bad fare and usage for such hard work, and the wonder is that they didn't strike sooner. A ship-owners' combination has been formed to resist their demands, but now that they are massed in an association, they must at once get a good deal of what they ask, and at intervals afterwards get even more than they have the face to ask for now. The same classes of seagoing men have also struck in several continental ports in the North, where wages are lower than even in the British Isles. Once inaugurated, the movement is certain to spread and grow stronger..... ..... A new war scare is just subsiding in Europe. The Regents who rule little Servia during the minority of King Alexander, are strongly in favor of Russia, while the late King Milan was equally strongly in favor of Austria. The other day Russia proposed to form a military convention with the Regents giving the Czar control of the Servian army, and they would doubtless have agreed were it not that Austria threatened to march an army at once into the country. Baffled for the moment, Russia is sure to persist in her designs, and is now trying to secure the deposition of the present boyish Servian King, and to put in his place the Prince of Montenegro or the subservient heir of the late Kanageorgevic dynasty. If Austria became embroiled with Russia, Germany and Italy must come to her aid, and then France, to avenge 1870, would have joined Russia; Greece and the Balkan States must have promptly taken sides, and Denmark as well as Norway and Sweeden couldn't well keep out, and it is probable that all Europe would have become embroiled unless victory inclined decidedly to one side or the other early in the struggle..... It is also charged that Russia is massing troops heavily on the Austrian frontier, and that Montenegro, her inalienable ally, is ready at any moment to offer a *casus belli* by an outbreak against Albania, Turkey, or Servia. Russia, however, insists that her intentions and movements are peaceful, and the scare is subsiding, while, of course, all parties are distrustfully watching each other..... There's an awful famine in some of the Chinese provinces. China is opposed to railroad construction mainly because such rapid and easy transportation would throw hundreds of thousands of porters and boatmen out of employment on the roads, rivers and canals; but it would prevent these constantly recurring famines in densely populated districts..... Latest Central African advices indicate that Emin Pasha will accompany Stanley to Zanzibar or some other point on the eastern coast of the Dark Continent. Emin's abandonment of the region which he has been trying to defend and civilize for so long a time, and probably of a large number of his faithful followers who couldn't accompany him, is generally looked upon as a severe though only temporary check to the civilization of that region. There's a good deal of talk already of building a railroad from the east coast to Lake Victoria Nyanza which would soon lead to the opening up of Eastern Central Africa. On the western coast a company has already been organized for the construction of a railroad 260 miles long from Congo Falls to Stanley Pool on the Congo river. This will afford transportation around the rapids of the river which stretches its devious course across two-thirds of the continent, making a mighty detour to the north and south and affording a longer stretch of navigable waters than does the Mississippi to Alton, lengthened by the Missouri to the head of navigation. The King of the Belgians, the founder and supporter of the Congo Free State, has contributed $2,000,000 to the stock of the company, and the rest has been subscribed chiefly by Scotch and English capitalists with $50,000 from C. P. Huntington, president of the Southern Pacific Railroad. The work is to be begun off hand, and will, no doubt, ultimately extend to the Atlantic coast. Great things are expected from it by merchants, engineers, navigators, philanthropists and missionaries. Its construction would, it is said, be a death blow to the terrible slave trade which still flourishes fatally in the region it would help to open up to humanizing influences.....

AGRICULTURAL NEWS.

SATURDAY, June 22, 1889.

FROM nearly every part of the Northwest, West, and Southwest, comes the complaint of too much rain, in many places accompanied by high winds, and, in some cases, by hail. The wheat is about all in shock in Tennessee and Kentucky, but rain has greatly retarded work, and seriously injured the crop. Harvesting is also well under way in Missouri and Kansas, but heavy rains have interfered with the work. Through other sections, wheat and other grains are lodging badly on account of the heavy rains. In the corn belt, the wet weather has prevented the proper working of the corn, and the fields are consequently getting very weedy and grassy. There has been damage by lightning in many places, and high winds have created great havoc in others. In the Chemung valley in Southern New York, heavy rains caused a flood nearly equal to the one of May 31, and which submerged all the lowlands along the river. The crops on these lands were all destroyed by the previous flood, and now all the labor that had been expended on replanting has come to naught. Parts of West Virginia have been visited by terrific storms. Berkley county was visited by a terrific gale of wind followed by a thunder storm, and this in turn was followed by hail. The hailstones were said to be three or four inches deep in some places, and crops were ruined. In some instances live stock was killed. Still in spite of these discouragements, the wet weather has been very favorable for the growth of most crops on uplands, and we shall hope for abundant harvests..... A large area was sown to wheat in Manitoba this year, and although growth has been rather slow, the prospect is good for a large crop.....The Jute Bagging Trust is trying to circumvent the anti-trust law of Missouri; where its headquarters are, by having its products sold before the law goes into effect..... ... .California beeswax is expected to arrive in commercial quantities this season. Samples shown are very handsome, and prices would fully equal rates for State.....There are inquiries for Pacific honey, new crop, at 8½ cents.....California Lima beans have been advanced to $3.40. Stocks are small and in few hands..... A new pest has made its appearance in Grant County, Indiana, which threatens to destroy the wheat, oats and rye crops. It is a small green bug or parasite that attaches itself to the base of the grain, and sucks the life out of it. It is believed that the backward crops will be utterly destroyed. Reports from adjacent counties indicate that the parasite is widespread..... A Frenchman has invented a textile fabric which he calls artificial silk.....Hon. William W. Wright, of Geneva, N. Y., President of the Board of Control of the New York Experiment Station, is dead at the age of 76.. .....The first meeting of the commission created by the last legislature to establish a Meteorological Bureau and Weather Service in the State of New York, was held in Ithaca, June 19 The board organized by the election of Hon. A. S. Draper as President, Hon. Simeon Smith as treasurer, and Professor E. A.

Entered at the Post-office at New York City, N. Y., as second-class mail matter.

Fuertes as director of the service. W. O. Kerr was appointed clerk to the committee. The temporary organization hitherto under the auspices of the Chief Signal Office of the Army was merged in the State service contemplated by law. The service begins with 45 regular volunteer stations and six United States stations, 49 of which stations display weather signals, and 81 crop correspondents. The central office of the commission is located at Cornell University..... A. D. Chase, of Watertown, N. Y., has been appointed statistician of the Agricultural Department for South Dakota ..... The first of the series of dairy conferences to be held at the fairs in New York State, was held at Walton, Delaware county, June 19. Col. Curtis and William H. Gilbert were the instructors, and gave a practical demonstration to the farmers present of the processes of butter-making. The cream from 200 pounds of milk from a herd of grade Jerseys was churned, washed, salted and worked, and was found to weigh 13¼ pounds, and to be of fine quality and color. In the afternoon a similar test was made with an equal quantity of milk from a herd of common cows, including a small proportion of Jersey grades. The quantity of butter obtained was only 7½ pounds, but the quality and color were good. Mr. Gilbert declared the average proportionate yield throughout the State to be about the same as the latter sample..... The 69th anniversary of the Rhode Island Society for the Encouragement of Domestic Industry, will be held at Narragansett Park, near Providence, September 23 to 27. David S. Collins of Cranston, secretary ..... Some sort of a fungus has attacked the cherry trees on Long Island, and threatens serious damage.... ....Later reports about the insect mentioned elsewhere as threatening destruction to the grain crops in Indiana, say that complaints are increasing. They come chiefly from the central and eastern part of the State, but the ravages of the little bug have already spread to Northern Indiana, and the secretary of the State Board of Agriculture regards the reports as alarming. The insect is what is known among agriculturists as the "green midge," another species of which is the "red midge." The latter last appeared in that region about 15 years ago and did great damage to the growing wheat. The "green midge," the little destroyer which is now doing such alarming work, has not been seen by farmers since 1865, when it almost entirely destroyed the wheat crop of Indiana and neighboring States. Millions of them appear in a field, settling upon a stalk from which they draw the sap, causing the grain to shrivel before it is matured. The insects are green in color. Little is known about the insects because their appearance has been rare .....Latest reports give cheering news of the prospects for wheat in Minnesota and Dakota. The crop promises an increase of several million bushels over last year.....

SPECIAL BUTTER, CHEESE AND HOP REPORTS.

UTICA, N. Y., June 22, 1889.—The cheese market has been very active during the week, the sales being large, and prices good. On Wednesday, 22, 595 boxes were sold. Sales for the week approximate 50,000 boxes. Prices run from eight to 9⅛ cents, averaging about 8½. Sales are much heavier than at this time last year. Extensive purchases were made by Candian buyers.

The butter market was weak, the supply being fully equal to the demand. At the other markets there were few sales. Prices ranged from 16 to 20 cents.

The hop market is dull, and but few sales have been made at 20 to 21 cents. The vines stood the storms well, and no vermin are reported. The prospect for the new crop is good.

A TELESCOPE FOR ONLY $1.00 WARRANTED.

We have imported expressly for our summer trade **2,000 large French Telescopes** at a very low price; they **open 32 inches** in three sections, and measure **closed 11 inches.** They are nicely brass bound with brass safety caps on each end to exclude dust, &c. The lenses are very **Powerful Crystals** polished by LEMAIRE & CO., of Paris. With this fine telescope objects miles away are brought close to view with astonishing clearness. Never before was a telescope of this size sold for less than from $5.00 to $8.00 and we shall offer only a limited number at this price. Every sojourner in the country or at seaside resorts should certainly secure one of these instruments, and no farmer should be without one. Sent by mail or express, safely packed, **prepaid for only $1.00; 6 for $5.00.** KIRTLAND BROS. & CO., 88 Fulton Street, New York City.

Meteorological.

"WEATHER-WISE."

How People Foresee the Weather.

RAIN INDICATIONS.

THE WEATHER ON LAKE MEMPHREMAGOG.

EVERY locality has its special weather signs, depending on the prevailing winds, the trend of mountain ranges and river valleys, and, much as regards their usefulness, upon the stored experience of those who have been interested, pecuniarily, in studying the aspects of the clouds, and the atmospheric conditions.

Westerly or southwesterly winds, in our section, always mean fine, dry weather, when settled in that quarter. Variable winds, in summer, especially if gusty, or very hot, still weather, portend sudden showers, or thunder storms. "A southerly wind and a cloudy sky" mean warm rain of more or less duration. "All signs fail in a dry time," but the longer we wait for rain the more we get when it comes, and with a south wind the more difficult it seems to get steady, dry weather again. Easterly winds are rare with us, as the trend of the long Connecticut valley, with its bordering mountains, tends to make the easterly winds of Southern New England assume a southerly course. If strong enough to reach us decidedly easterly, they bring cold rains of moderate duration, which clear off fair, and the weather stays so. As to moon signs, though still often quoted, and though no amount of failure is sufficient to cause them to be forgotten, the only one I have ever found worth anything to me as a farmer, is the fact that a full or nearly full moon tends to disperse the clouds so that though in its lesser phases we may not see the moon for a week, we are very sure to see it during the week of approximate fullness. The agricultural consequence is, that when the moon fulls the last of May, or thereabouts, and also at the full in September, we are pretty sure to get frosts, especially in frosty localities. As for plans, experienced farmers take advantage of those signs as above stated, which show the least prospect for wet weather, for those operations which require dry weather for their success. T. H. HOSKINS.

Orleans County, Vt.

NEW JERSEY INDICATIONS.

It is very difficult to tell what the weather will be 24 hours hence. The atmospheric changes are often so sudden as to baffle our best calculations, yet there are certain signs that seldom fail us. 1. If the sun rises clear in the morning and then goes under the clouds, as we call it, within half an hour, in nine cases out of 10 it will rain before 12 o'clock. 2. If the sun sets in a heavy bank of clouds it is about certain to rain before morning. 3. If the wind veers suddenly to the southwest with a damp atmosphere, it is very apt to rain within 24 hours; but if the rain is withheld for 36 hours it is not likely to rain until the wind changes to another quarter, and if one is engaged in work that requires dry weather, such as harvesting hay, he should push the work vigorously as long as the wind holds in the southerly quarter. 4. Sun-dogs, so-called, are indicative of rain within 18 hours, and seldom fail. 5. The feathered tribes calculate very accurately as to what the weather will be 12 to 24 hours ahead. If one sees the fowls go about picking up food, and they are late in going to roost, it is very likely to storm before morning. The cooing or mourning of the dove indicates rain soon. These are the principal signs by which my actions in regard to my work are governed, and I find them about as correct as anything that comes under my observation. J. P.

Princeton.

CENTRAL NEW YORK.

A "weather prophet" is without honor at home or abroad. The man who claims to foretell the weather for next week or next month is justly ridiculed whenever his name is mentioned in connection with such predictions. That an experienced observer can usually discern the approach of a rain-storm in time to avoid serious loss through misdirected labor, is true. Reliance may be placed on indications of fair weather for to-day and to-morrow, and work may be so planned from day to day as to profit by this fact. With comparative certainty of the weather for this short period, very little damage to hay or grain will be sustained by the careful manager.

While some of the indications of rain are easily described and understood, others can hardly be made plain by words alone. If the farmer says that it "feels like rain," he mentions an important sign when taken in connection with other indications. But just what is meant by "feeling like rain" it is difficult to tell. Humidity, denseness, and temperature are involved in this condition of the atmosphere, that usually precedes rain. Again, the farmer says that it looks like rain, and in an hour after says the appearances of rain have passed away, but the change is hardly perceptible except to careful observation.

"All signs fail in dry times," but except in continued drought the absence of dew in the morning is a fine warning to look out for rain. If the wind is in the east and veers to the southeast or south and continues there, it will rain. Sometimes the wind will be in the south through the day with indications of rain, and toward night these appearances will pass away. This may occur for two or three days in succession, and usually terminates in a heavy rain. Look out for rain as long as these daily threatenings continue.

When signs of rain have been noticed for some time and the sky is generally cloudy, if small, dark, scudding clouds are seen it will rain very soon. Two sets of clouds, one above the other, moving in different directions, indicate catching weather. If, with a partially cloudy or hazy sky, the sun shines at intervals with what is termed scalding heat, rain may be expected. This scalding sun is different from the ordinary hot sun of fair weather and is readily recognized by the observer of rain indications.

Most of our regular rain-storms begin with the wind in the south or southeast, afterwards changing to west or northwest. After such a rain if it clears in the night, the weather is not to be trusted until proved. Often after such clearing, clouds will return and light showers may be expected. Sometimes rain-storms come from the West. After several clear days, if with a light wind, a continuous bank of cloud appears in the west, extending well north and increasing towards evening hay or grain should be well secured, as it will probably rain.

The moon has no appreciable influence on the weather or the growth of crops. The idea that certain days, known as "almanac days," have any connection with the weather for future weeks or months is too absurd to receive intelligent notice. Instinctive unrest may be noticed among animals as the precursor of a storm, but these appearances are not reliable, as such animals really know no more about the weather than their owners. Where bees are kept, a regular cloud of workers may be seen hurrying home on the near approach of a storm. Their warning is of no use, however, as they do not start for home until the danger of immediate rain is plain to everybody.

After a day or two of rain, if the clouds disappear and mist or fog drifts from the lowlands and streams to higher points, and the wind comes from any point between west and northwest, and there is neither haziness nor scalding sun, two or three days of fair weather may be confidently expected. The wind is often in the east in the morning, changing to the west by nine o'clock; but this is no sign of rain. Unexpected showers will sometimes overtake a careful observer, but attention to the few weather indications above noticed will usually enable the farmer to secure his hay and grain without serious damage.

Lewis County. C. S. RICE.

Miscellaneous.

FARM HELP.

W. L. DEVEREAUX.

LABORERS on the farm engaged by the month are mostly of American birth, in Wayne as well as in surrounding counties. A large share, however, are the sons of Irish and German immigrants. If these are counted in together with the direct immigrants hired by the month, not more than half the number of monthly hands will be natives or long-resident Americans. Men employed by the month are very often the sons of small farmers of the afore-mentioned nationalities, who are working hard to pay for farms on shares, and having the proverbial large families, can spare some of the boys as they grow up. These boys usually make good help for the farmer who hires. Their wages commonly begin with the same number of dollars per month as there are years in their lives, but their monthly wages very soon increase though they never get above $23.

Very many more than would at first sight appear are born of American families, and are well educated young men, reliable, and really valuable assistants, competent to take the lead in the farming operations of their employers. After working in the capacity of monthly hands for several years, the majority from every nationality, without any exceptions, drift to the West, or to the railroads. A few lay up money and establish themselves *in farming* by renting farms, or by sticking to some piece *of land* by making a "first payment" and tilling the soil into paying for itself. If of German parentage, they are *sure* to lift the mortgage. If of Irish, they are not quite so sure, and if of an old American family, they are still less sure of doing so.

In a circumscribed locality where there are 100 monthly hands, I estimate that after a half generation, there will remain only 15. Of these four will be Irish or close descendants of Irish parents, who have taken up farming on their own account; three will be German who have adopted the same calling; and three will be Americans who have done likewise. Five will have settled down as day farm-laborers in tenements, or else they will be owners of small lots, nationality proportioned as before. Although the above ratio is against the prospect that a majority of Americans will in the future own farms, it is a fact in this region that American owners greatly predominate now, and will always do so; for the American or Yankee farmers' sons, or some of their sons, buy most of the farms or divisions offered for sale.

In some localities numerous Italian day laborers are employed at extra work and as extra laborers in busy seasons, but for our constant and chief reliance, a monthly hand is secured by almost every farmer, and he is usually engaged to begin on April first for seven months, under a few simple, unwritten conditions, boarding with his employer, or with his foreman. He attends to the chores in the morning before the day laborer begins for his 10 hours' work. He again does the chores at night after the 10 hours' work is over, and he also does them on Sundays, but less stringently, though some farmers employ men who are willing to follow their lead and management in working from sun to sun, or rather from twilight to twilight, chores included. Very many, however, regulate the work, chores and all, quite close to the 10-hour system.

I think farmers are a unit on the plan of securing the best man possible, and paying him his price; but the man who demands the very highest price is rarely the best. Activity is the great requirement, and with this, a sturdy boy at work with the manifold horse-power implements used now in farming will accomplish more than a strong man. Farmers complain that hired men accomplish less than formerly, while wages continue to tend upwards, which arouses them to the employment of more labor-saving machinery, and improved systematic labor-saving plans. A few farmers employ men by the year, and most of these have families and reside in tenements on the farms. Here are the wages or rather allowances demanded of a farmer here, the other day, by one of this class of laborers: "$17 per month, house rent, cow pasture and feed, fire wood, the use of one acre of land and time to work it." It calls for a very nicely drawn contract.

Wayne County, N. Y.

BOOK REVIEWS.

WE are in receipt of volumes III and IV of The Riverside Library for Young People, published by Houghton, Mifflin & Co., Boston and New York. They are devoted to different branches of natural history are both written by women who have evidently studied their subjects with an interest born of love for the study. They are such books as we are glad to see put upon the market at a reasonable price. "Birds Through an Opera Glass," by Florence A. Merriam, treats of a large number of our common birds, in a charming style, with all technical terms omitted. The author has studied the subjects in a praiseworthy way, by observing them while at home in their native haunts, instead of, as is generally the case, after they have been cruelly murdered. Under "Hints to Observers," the author gives a few simple rules for studying the habits of our native songsters to the best advantage. In an appendix is given an arrangement for classifying birds as they are named; the general characteristics of birds; classifications of birds described, and a list of books of reference for those who may desire to pursue the subject further. Would that we might see such a book as this in every home, especially where there are young people.

"Up and Down the Brooks," by Mary E. Bramford, describes, in a bright, chatty, interesting way, a great many insects she has found in the brooks of Alameda county, California. She says, however, that members of the same families of insects will be found in or beside almost any brook, East or West. She says also that the various types of boy encountered probably exist in both sections. These books are both profusely illustrated, and in their neat, handy form and attractive style, should meet with a large sale.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

SETTLEMENT OF AN INTESTATE'S ESTATE.

T. S. M., Newark, N. J.—My grandmother who died seven years ago, without leaving a will, owned a farm in this State and considerable other real property besides some personal property. The heirs now are my three aunts, and two children of a fourth aunt who died since my grandmother's death. These children are 15 and 13 years old. In my opinion the property does not bring in one-third as much income as it ought to bring, under proper management. How can it be settled? Can it be sold by auction? If not, how can I compel the other heirs to make it a source of the income it ought to bring?

ANS.—In the settlement of an intestate's estate, the first step is to secure the appointment of an administrator. The Surrogate of the county in which the deceased resided at the time of his or her death, has power and authority to grant letters of administration, and application should be made to him. The administrator having been appointed, it becomes his duty to collect the effects of the estate, pay the debts, and under direction of the court make a just and equal distribution of the personal estate. He may sell personal property at auction after advertisement of the sale. Any one being a co-partner, joint tenant or tenant in common, in New Jersey, may apply to any Justice of the Supreme Court, or of the Court of Common Pleas, in the county wherein the lands lie, for a partition of the real estate. Three commissioners will then be appointed to make the partition. If it can be done without prejudice to the interests of the owners, the land will be sold and a distribution of the proceeds made. After partition or sale and distribution, each owner may make such use of his part of the property as he pleases.

LIABILITY OF THE POSSESSOR OF ANIMALS.

N. C., Breesport, N. Y.—A let a farm on shares to B with a lot of cows. B's 23-year-old son has a rather vicious dog which bit a fine Jersey heifer on the shoulder and pulled off the tails of four cows while driving them some time ago. This the son admitted. A remonstrated with B for letting such a brute remain around his premises, and then attempted to shoot the dog; thereupon B's son threatened to shoot a cow, and no restraint was put on the dog. Since then the dog has bitten off the tail of a very fine Holstein heifer. Neither B nor his son is financially responsible. Has A any remedy?

ANS.—If the dog is not licensed anybody can kill him with impunity. Such a brute is also a public nuisance, and as such any court will order his execution. If the son were to carry out his threat by killing a cow, he could be criminally prosecuted for malicious mischief. If B were financially responsible, there would be no difficulty in legally collecting from him actual, if not exemplary damages for the injury done by the dog. In some of the States double or triple damages are awarded in such cases. The circumstance that the brute belongs to his son, would make no difference with regard to B's liability for damages. Not only is the owner of an animal liable for its acts; but one who harbors it or allows it to remain on his premises or to resort to them is also liable; that is, one is liable who having control of a house or premises, suffers or permits such an animal to stay on the premises in the way such domestic animals are usually kept—as a member of the family, so to speak.

DUTY OF CUTTING WEEDS, ETC., ON HIGHWAYS.

T. M. S., Lawrence County, Ohio.—A great number of weeds are flourishing along the highway near my farm; must I cut them down to prevent the seeds from infesting my land, or is it not the duty of the road supervisors to do so?

ANS.—It is certainly the duty of the road supervisors to cut the highway weeds. The Ohio law provides that the road supervisors shall cut down and destroy all weeds, burrs, bushes and briars growing within any county or township highway, in June and August each year. They may allow a land owner a reasonable compensation for destroying the pests in the roads on which his land abuts, and credit the amount on his road tax for the year. The compensation must be fixed by the supervisors before the work is done; but if any one does the work before contracting with the supervisors for it, he cannot compel the supervisors to grant him any credit for it. The superintendent of any turnpike road on which toll is charged, must cut down all such pests growing within the turnpike, and if he neglects to do so before September 1., the trustees shall cause the work to be done, and they have a right of action against the turnpike company for the amount paid for the labor, together with a penalty of 100 per cent. to be recovered before any justice of the township.

Various.

"DID NATURE MAKE A MISTAKE IN THIS ARRANGEMENT?"

HENRY STEWART.

Wastes of Nature; definition of Nature; enormous wastes of vegetable and animal life; races created to be the prey of others; wastes of the human race; wastes of worlds; Does Nature make mistakes? Is Nature another name for God? Are "wastes" of Nature mistakes only to our finite minds?

THE RURAL asks the above question in its editorial columns in regard to the valuable feeding qualities of the cactus of the West,—the "prickly pear" I presume is referred to—and its formidable spines by which its use—its only valuable property—is prevented. What a pertinent and far-reaching question this is! It has been occupying my mind for some time past, as I have been studying the various phenomena which may be aptly classed under the term "the wastes of Nature."

To consider this question will afford a vast amount of useful study and thought for every man, woman and child; for all are interested in these wastes, and the human mind is most powerfully attracted by the mystery resting at the bottom of it, which may be materialized to the mind in the question "What is Nature?" Nature may mean different things to different minds; but I think all may unite in accepting this view of it; viz.; it is that supreme power, law, force, or personality, as it may be to different persons, by which what we call natural processes, or the preservation and progressive condition of the Universe, and with it all that it contains, were originated and are continued. Assuming this grand power, against which every living thing is powerless, to be the controlling force for good or evil, we ask, is it good or evil; or both good and evil; and does it make mistakes, and waste its energies in useless or disastrous and sometimes cruel blunders? Those abundant beds of cactus which one sees all over the driest and most arid Western plains, are full of life-giving nutriment and water, and sufficient of themselves to nourish and sustain vast herds of cattle which may be perishing of starvation and thirst, were it not that Nature, which is supposed and believed to be omniscient, all-wise, and entirely good and beneficent, has adorned the plants with the cruel spines that effectually repel the eager animals from the stores of food and water contained in them.

During the last few weeks, a withering frost passed over a large part of the Southern country destroying every apple and peach blossom and fruit bud, and the young corn and wheat; six weeks of dry weather, excessive heat and drying winds have all but destroyed the grass; the quail and partridge nested and the young birds were nearly hatched when a cold, sweeping rain storm flooded the country and destroyed the broods. These are but minor instances. Millions of seeds are produced by plants of which but one in millions becomes effective. One race of animal life subsists only to be devoured by another, and even the human race is subjected to this prevailing—shall I say mistake? An account of the African slave trade recently published in one of the leading monthlies, gives an amazing picture of this seeming fruitless and destructive mistake of Nature and of its awful waste of human life. One single raid of the brutal, bloody savage Arab hordes upon the negro country depopulated a district as large as the whole of New England, and turned fertile fields and populous villages into a silent desert, with only its silence appealing to reason and human sympathy, by calling attention to the desolated fields, charred ruins, and bleaching bones, as the only residue left of what was previously the homes of two million human beings living in peace, comfort and happiness, all unsuspicious of danger until the night attack of the slave catchers and their murderous bullets and swords brought death and destruction. Of this population all were slain suddenly or perished in the most miserable manner during the march to the slave markets, except one-quarter of one per cent. of them; one young man, or girl, or useful woman or child only out of 400 souls surviving the horrid "mistake of Nature."

So the fruit grower kills myriads of insects, which, were they let alone, would reduce him to starvation, and on every hand we find destruction of life that has been produced at great cost of energy and natural force, through parasites of all kinds down to the infinitesimal microbes, incomprehensibly vast in number and effect, which produce fatal diseases and feed upon the life of both plants and animals. Everywhere we see the most lavish waste where we might be led to look for a wise economy of force or energy, and the mind's eye, looking through the glass of science towards the earth's inevitable ending, sees the final destruction of every living thing upon it, and a dead world, a ruin—such as is the moon—coldly, and we may think, uselessly "walking" along its endless path, giving useless brilliance to the cloudless nights of a useless satellite, and as far as we know, equally useless adjacent planets.

Has Nature made mistakes? Are all these instances, and numberless others to which the mind may turn, evidences of something wrong in the arrangement of the Universe? Are all these things that are apparent to the thoughtful mind, the origin of the belief, in the primitive man, of the existence of an Evil Spirit whose malevolence blasts the intended benevolent fruition of Nature, and turns what might have been good or useful to something injurious and worse than useless; a belief which has come down to us through unknown ages of transition as the idea of something evil which exists as a controlling force impossible to be resisted without supernatural help and which has taken the form of a Devil, to the human mind?

That there is a vast amount of—evil—as we term it; but let me say, of mistaken and misdirected force—in the Universe no one can deny or doubt. The very creeds of the orthodox churches have this idea embodied in their confessions of faith, but whether it is a mistake on the part of Nature (call this a Creator, a law, or a force, as men may; it differs not in the principle involved) or a well defined purpose of the Creator or the power which originated the supreme and resistless forces which control the whole Universe (either view is as grand and sublime and as truly religious as the other), we cannot now tell. Let us hope we may be able to do so in another and future life when such things may become clear to us and the true and high destiny of the human mind and intelligence may be reached by its full development. If it were otherwise, and the human soul were doomed to extinction as a dead planet or animal, then, indeed, we might fear that Nature had made a mistake in denying to mankind an intellectual development for which the human soul yearns, and for which it lives hopefully through a life fretted and filled with blasted hopes, disappointments, cruel mistakes, and sins and suffering the unerring punishment which so quickly follows these, and causes untellable sorrows and pangs. But Nature I think has not made this mistake, and perhaps the thought that it has made any blunder at all is a mistake of our own imperfect intelligence.

CATALOGUES, ETC., RECEIVED.

UTAH AS A STATE.—This is a copy of the report of the Committee on Territories to the House of Representatives. It presents, in a condensed form, the arguments for and against the admission of Utah. It looks as though the Committee tried to make a special plea for admission. In the matters of population, wealth, educational advantages, etc., etc., it is very likely that Utah is entitled to a place among the States. The existence of polygamy and the power and teachings of the Mormon Church on that subject are the great objections urged against admission. This Committee would evidently have the public believe that these objections are not so serious as is generally understood. The R. N.-Y. does not believe that the American people will agree with this view. It seems likely to the R. N.-Y. that with Utah maintaining a State government, the power of the Mormons for mischief would be greatly enlarged.

ENSILAGE AND SILOS.—E. W. Ross & Co., of Springfield, Ohio, have issued two very attractive volumes that farmers will want to read. One of these pamphlets treats of the famous Ross silage and fodder cutter. Our readers will remember that a good proportion of those who contributed to our short symposium on the cost of ensilage, are using the Ross cutter. An examination of this pamphlet shows very plainly why this cutter is popular. Every part of the machine is carefully illustrated and the reader is convinced that it is strong, durable and effective. We consider this circular a very effective advertisement because it so clearly points out what it aims to show. The other pamphlet is a compilation of letters and essays on the subject of ensilage. This system is quite young yet, and new developments are constantly being made. Even the man who thinks he knows all about it can learn something from this admirable volume.

THE WHITE MOUNTAIN FREEZER.—Circulars from the White Mountain Freezer Co., Nashua, N. H. We would like to have some one tell us why ice-cream should not be served in the farm house? Ice-cream, as we eat it, is a more healthful food than cake and does not cost much more either. By the use of the White Mountain freezer the labor of preparing it is reduced to a minimum. We would like to see one of these freezers in every good farm house in this country. They are designed for cold work, but they will be the means of wonderfully warming up the family happiness. Our readers will not be able to find any better freezer than this. You need one. Send for this circular and see if we are not right.

METAL RAILWAY TIES.—Bulletin No. 3, Forestry Division, United States Department of Agriculture. In this bulletin may be found some valuable information on the use of metal ties on railways as a substitute for wooden ties. It appears that 256 patents for such ties have already been taken out in this country. While American railroads have done little besides experiment with the metal ties, European railroads have quite generally adopted them. The first cost of the ties is considerably greater than of those made of wood, but they last longer, are safer and are lighter and more easily handled. From the statement made in this pamphlet, we should say that the timber demanded for railroad ties need never cut any serious figure in forestry matters.

SOME LATE WORDS ABOUT LOUISIANA.—This pamphlet is issued by T. W. Poole, Commissioner of Immigration of Louisiana. It is a special plea in favor of Louisiana as a home for Northern immigrants. It is a good thing to read before making an investigating trip to that State.

MASSACHUSETTS EXPERIMENT STATION.—Bulletin No. 34 discusses a variety of topics. Prof. Humphrey is endeavoring to throw some light upon potato scab. He sends a list of questions that farmers are requested to answer. These questions refer to different fertilizers, different methods of planting, etc., etc. The creamery record of the Station for 1887 and 1888 affords a basis for some interesting figures. A good many farmers are going into dairying because they believe that when butter is sold from the farm it takes less of the fertilizing elements than are taken in any other farm product. This seems to be a general belief among farmers. The figures given in this bulletin show how true this belief is. Here it is shown that in selling the cream from the farm but 3.05 per cent. of the total fertilizing value of the feed was sent away. If the butter were made at home this proportion would be even less. When whole milk is sent away from the farm, 20 per cent. of the fertilizing value of the feed goes with it.

CONSULAR REPORTS.—No. 102 contains a variety of interesting matter. The Congress of the Central American States is described. There is also quite an interesting account of the industries of the Argentine Republic—a country that is attracting world-wide attention now. Brazil is another country that is calling for immigrants. Rubber production on the lands along the Amazon offers a field for American energy—though we believe there is still ample space for this energy at home.

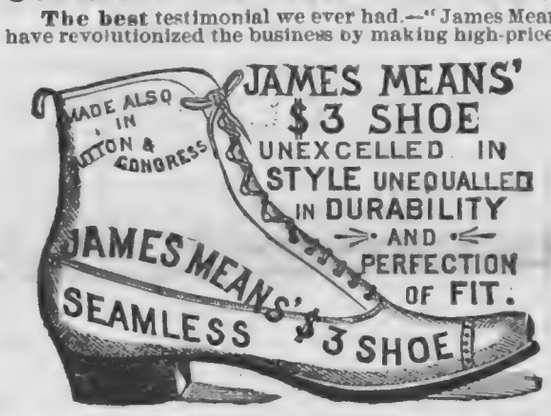
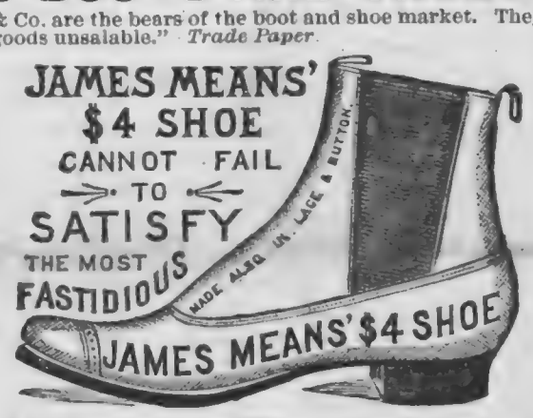
JAMES MEANS & CO.'S BOOTS AND SHOES.

The best testimonial we ever had.—"James Means & Co. are the bears of the boot and shoe market. They have revolutionized the business by making high-priced goods unsalable." *Trade Paper.*





JAMES MEANS' BOOTS AND SHOES
Are Unexcelled in Merit.

Positively none genuine unless having our name and price stamped plainly on the soles. Your retailer will supply you with Boots and Shoes so stamped if you insist upon his doing so; if you do not insist, some retailers will coax you into buying inferior goods upon which they make a larger profit. Ours are the original $3 and $4 Shoes, and those who imitate our system of business are unable to compete with us in quality of factory products. In our lines, we are the largest manufacturers in the United States.
How your boy does wear out his shoes!
James Means' $2 Shoes for Boys will outwear any other boys' shoe ever made. You can have Lace or Button.

$2 50 BUYS THE BEST FARMERS' THICK BOOT.
JAMES MEANS'
QUARTER-EAGLE BOOT.
A Reliable Kip Boot for Farmers.

10 Mills make one Cent;
10 Cents make one Dime;
10 Dimes make one Dollar;
10 Dollars make one Eagle.

And with a Quarter-Eagle any Farmer in the Country can now buy a boot that will satisfy him. Farmers have been looking for such a boot for a long time, and now it has come.
Boots and Shoes from our celebrated factory are sold by wide-awake retailers in all parts of the country. We will place them easily within your reach in any State or Territory if you will invest one cent in a postal and write to us.

Special Offer on the JAMES MEANS QUARTER-EAGLE KIP BOOT for Farmers

In order to immediately distribute samples of these boots all over the country, we will send them, transportation paid, to any man in any place where there is a post office or railroad in any State or Territory of the United States. We will send them by express or by mail, with all charges for transportation to destination prepaid by ourselves, on receipt of regular price, $2.50. Send money by post-office order or registered letter or except United States postage stamps for the odd half dollar.
In order to get a perfect fit, take a piece of paper and place your foot upon it, then mark out the shape of your foot, keeping your pencil close to the foot all the way around. Then take the last boot which you wore and mark out the shape of that in the same way. We will fill your order on the same day we receive it. Take great care to be accurate, and be sure to give us your full address—town, county, and State or Territory. If we have a dealer selling our goods in your town we want you to buy of him; we do **not** want you to send to us as we will not interfere with the dealers who sell our goods, but we are glad to supply you if your dealer will not. Any boot and shoe retailer or any country store-keeper can supply you with our goods if he wants to, but some dealers will try to sell you inferior goods on which they make a larger profit than they ought to ask for it. In that case, send to us.

JAMES MEANS & CO., 41 Lincoln Street, Boston, Mass.

Farm Topics.

NEW JERSEY FARMS THAT PAY.

EDITORIAL CORRESPONDENCE.

NO. I.

REFERENCE was made two weeks ago to a visit recently made to what the R. N.-Y. considers an ideal farming community. It is proposed in this and subsequent papers to give a record of this visit with such reflections upon the wisdom of the agricultural methods employed there, as were suggested to the mind of the writer. The point chosen for observation was Cranbury, Middlesex County. This place is situated some 50 miles from New York City. The railroad facilities are such that farmers near Cranbury are unable to raise and ship "market truck" successfully. The same may be said of milk. There are too many changes of cars to be made before the milk can be placed in New York. Strawberries are raised to some extent and efforts are being made to establish an interest in peach culture; but the main business of the community is the production of potatoes, hay, corn and wheat—crops that theoretical farmers would be least likely to recommend for a section within 50 miles of New York city. It was mainly because the farm practices of the Cranbury farmers seemed to throw the recognized rules of agricultural economy out of joint that the R. N.-Y. was anxious to see how such farming paid.

Here are two statements made in the R. N.-Y. office within the past month.

1. "Within 40 years the farming lands of New England, New Jersey and Eastern New York will be reduced to the condition of a desert. The land west of the Alleghanies can produce more food than the people of the country can consume and railroad transportation is being so perfected that the Western farmer can undersell the world in any market. Whenever a section of country begins to use large quantities of chemical fertilizers, its agriculture is surely doomed—just as the man who begins the continued use of stimulants must bid farewell to health. The future of Eastern agriculture is easy to predict. The majority of the manufacturing enterprises must, sooner or later, go to the places where their raw materials are produced. The great seaports will, of course, remain. The country for a few miles around them will support thousands of foreign gardeners and fruit men, but back of this strip, lightning trains from the West will run through deserted farming sections given up to wilderness and desolation." This dismal prophecy was made by a Western farmer who evidently meant what he said.

2. "In 40 years from this time, the rich lands of the country will be at the East, while the poor lands will be at the West. Every principle that is supplied to the soil in stable manure, can be supplied by a system of rotation, in which chemical fertilizers form the basis of fertility. The crops will grow larger and larger, the soil richer and richer, and the labor less and less exacting. The Western farmer of the future will have to perform all the drudgery of dairying and stock keeping. The Eastern farmer need do but little of this work, but may substitute for stable manure the easily applied chemicals." This bright picture was drawn by a farmer who sells fertilizers, and uses his crops and the condition of his soil as the best advertisement he can find.

Which is right? The conservative farmers will say, "Neither." Which is nearer right? Perhaps the condition of the soil and the crops at Cranbury may help to determine. The farms about Cranbury are mainly given up to a five-course rotation as follows:

1. Potatoes on corn ground. The land is plowed in the spring and a liberal supply of complete potato fertilizer is applied. Farmers usually begin with a small amount of fertilizer, but as its effects become more and more apparent the amount is increased until from 1,500 to 2,000 pounds per acre are used. 2. The potatoes are dug in time and wheat is sown on the potato land with a seeding of Timothy. In the spring clover seed is sown and in some cases a top-dressing of fertilizer—200 or 300 pounds per acre—is applied. 3. The ground after wheat, stands in grass two years. 4. After the last mowing in July, all the stable manure on the farm is spread on the sod. It remains there until spring when it is plowed under and the ground is planted to corn. The next year the corn field is planted to potatoes with the fertilizer and so the rotation continues.

This, in a nutshell, is the system of farming that is making these farmers comfortably well off. It is a system that is based directly on fertilizers. Ask what sort of a farmer A, B or C may be and you will be told that he uses 700 pounds, 1,000 pounds or a ton, as the case may be.

In Iowa a man is a 500-acre farmer, or a 1,000-acre farmer. In Michigan the farmer may be graded by the number of sheep or cattle he keeps; in Ohio by the number of acres of good wheat; on Long Island by the number of cauliflowers or the size of the asparagus plantation; in Vermont by the number of maple trees tapped annually. Cranbury farmers seem to be graded by the number of pounds of fertilizer they use on an acre of potatoes. The farmers are full of fertilizer talk. It is impossible to start a conversation on any subject without being drawn into the great topic. There is good reason for this when we remember that each of these farmers pays all the way from $400 to $1,000 in cash each year for fertilizers.

Perhaps the best way to give a fair idea of the way these farmers look at agriculture is to report the conversation the R. N.-Y. held with them.

R. N.-Y. "How long is it since you began the use of chemical fertilizers?"

FARMER L. "I have used them in small quantities for years. For 14 years now I have been gradually increasing the amount used per acre. I now use about 1,800 pounds per acre, but I do not think the limit of profit will be reached until I reach 2,200 pounds."

R. N.-Y.—"What induced you to put on your first heavy dressing?"

FARMER L.—"I visited a farmer on Long Island, who had used over a ton on potatoes. I had never before seen such grass as he had growing. He seemed like a close man, too, and I thought it it would pay him to use a ton it would pay me to try 1,500 pounds. I tried it on the potatoes and sowed wheat and Timothy as usual. I could not see a great deal of benefit on the potatoes and not quite enough benefit on the wheat to pay; but when the grass came there was no question about it. I never cut such a crop before."

R. N.-Y.—"How large is your farm?"

FARMER L.—"Just 100 acres."

R. N.-Y.—"How much stock do you keep?"

FARMER L.—"Three cows and my working teams."

HEAD OF A CALF. From Nature. Fig. 164.

R. N.-Y.—"How much hay did you sell last year?"

FARMER L.—"Ninety tons, besides what I fed to my stock."

R. N.-Y.—"Will you keep more stock in winter?"

FARMER L.—"No. It does not pay me. I used to feed steers, but since the dressed beef trade has developed, such feeding does not pay. I do not like sheep. The only use I have for live stock is to turn my stalks into manure. The disposal of these stalks is the most serious problem we have. We can sell our grain, but the stalks bother us."

R. N.-Y.—"Why not use rye in the place of wheat for seeding? The extra value of the straw would make the crop more profitable."

FARMER L.—"Hay is our great crop. Anything that interferes with that we wish to avoid. Our experience with rye is that it is not so good as wheat for seeding. If we put on all the fertilizer we want for the grass the rye is quite sure to lodge badly. With wheat we are reasonably safe to put on all the fertilizer we want. When we put fertilizer on our potatoes, we look forward two years to the grass crop. That is why we put on so much. For years and years we thought with other farmers that fertilizers were so soluble that it was only safe to put on just enough for one crop. That is all nonense. On ordinarily level ground we find fertilizers as safe in the ground as out of it, safer too with wheat and grass coming along to make use of them. The more fertilizers I use, the more money I make."

Dairy Husbandry.

IS CREAM CREAM?

EVIDENTLY NOT!

WIDE DIFFERENCES SHOWN.

AN INTERESTING DAIRY SYMPOSIUM.

Answers by Dr. Collier, Prof. Babcock, Dr. Hoskins, Dr. Henry Stewart and T. D. Curtis.

THE R. N.-Y. asked the above question a few weeks ago. The discussion was started by the following question. The answers which accompany it seem to settle the matter conclusively:

T. E. B., Schuylerville, N. Y.—Will a certain amount of cream make the same amount of butter that another exactly similar amount will make, provided they are raised under the same conditions—in a Cooley creamer, for instance—but taken from the milk of different cows of different breeds? Co-operative dairying in which the milk of all is received as though it were of equal value is certainly unjust; is not the system where all sorts of cream are received as of equal value, bulk for bulk, more or less so?

FROM DR. PETER COLLIER.

I think cream varies quite as much as does milk, and, further, I believe that, if two samples of milk from different cows of different breeds shall be set under conditions absolutely the same, even granting that chemical analysis shall prove the composition of the two samples of milk to be the same, or even the composition of the samples of cream which may be secured from them—I believe, I repeat, that the difference which we know to exist in the mechanical condition (since milk is practically an emulsion of fats in a solution of the caseine and the other soluble constituents) will be sufficient to make an appreciable difference in the amount of butter which may be obtained by churning, especially if this operation is conducted in the same way with both samples of cream.

I think it is safe to say that, despite the immense importance of the dairy industry, the art of butter making—the raising, ripening and churning of the cream, and the working of the butter—is at present far in advance of the science, and that hundreds of dairymaids throughout the country are able to make first-rate butter, who cannot tell lactic acid from quartz, and are in profound ignorance of the existence of soluble fats as well as of every scientific principle involved in the art which they have brought to such success. This ought not to be. The rule of thumb, with good judgment, suffices for the one out of the hundred, but for the 99 others there is no hope other than the clearly ascertained principles of science by which their work may be guided.

Readers of the RURAL are, of course, aware that it is for the solution of such questions as this correspondent asks, and also of other questions of the same nature, that this experiment station has recently been securing representative animals of the several leading dairy breeds, and we at present have at the station six Holstein-Friesians, five Ayrshires, four American-Holderness, four Guernseys, and expect to add to these Jerseys and Shorthorns, and possibly representatives of other breeds.

We hope and expect, as the result of our investigations, to be able to determine the relative value of these several breeds for the production of milk, butter, cheese and beef; as also the results produced by different food rations, and, in short, the many practical and scientific questions which at present are brought up whenever dairy practice is under discussion.

N. Y. Agricultural Experiment Station.

FROM DR. T. H. HOSKINS.

No; the same amount of cream by weight or measure, will not make the same weight or grade of butter. Some cream will not make more than half as much butter from an equal measure as other cream. The business is all guess-work when done in this way, and very decidedly against those farmers who have the best butter cows, or are the best feeders. The "raising under the same conditions" will not remedy the matter at all. In a neighborhood of farmers where cows and their owners are severally about all alike, the co-operative plan may not work much injustice; but it becomes a fatal enemy to improvement, and butter made in such factories is necessarily of an inferior grade, no matter how skillful the operator of the creamery may be. "Cream is cream" just as water is water, or meat is meat, or bread is bread; but cream is not sufficiently alike from different herds and under different keeping to be paid for at one price.

Orleans County, Vermont.

FROM PROF. S. M BABCOCK.

The composition of cream depends nearly as much upon the physical properties of the milk from which it is derived as upon the conditions under which it is separated. Variations in the specific gravity and in the viscosity of the milk serum have a decided influence upon the quality of the cream. A high specific gravity tends to crowd the fat globules closer together, and gives a cream rich in fat. A very viscous serum prevents a near approach of the fat globules to each other, and gives a thick cream that is comparatively poor in fat. As both the specific gravity and the viscosity of the milk serum vary with different cows, and even with the same cows at different times, we would expect considerable differences in cream from different herds. Some idea of how great this difference may be is shown by analyses of cream made at this station during the past year. The milk was all set in Cooley cans, ice being used in all cases, so that the conditions of creaming were nearly uniform. A number of analyses of cream, taken at random from our books, show the following per cents. of fat: No. 1, 20.80; No. 2, 19.40; No. 3, 24.10; No. 4, 22.42; No. 5, 14-10; No. 6, 16.90; No. 7, 18.14; No. 8, 17.90; No. 9, 24.60; No. 10, 15.87. We have in these creams a variation from 14.10 per cent. to 24.60 per cent of fat, and their value for butter production would be nearly proportional to these figures, so that No. 9 would be worth nearly 75 per cent. more than No 5. I believe that this variation is no greater than would be found in creams received at a factory from different patrons. In other words, I believe that just as much injustice may be done by dividing the receipts of the factory according to the amount of cream supplied, as by giving equal values to equal weights of milk. No system of division is just which does not provide some means for determining the butter value of the milk or cream.

Wisconsin Experiment Station.

FROM DR. HENRY STEWART.

It seems as if through all kinds of human industry a general average must be struck and one "must bear another's burdens." It is at present certainly so in all co-operative enterprises; for if not, why should co-operation be desirable or effective for the general good? Human industry can never be more perfect than the men employed in it are, and if some are incompetent, or weak, or helpless, the more able are forced to assist them by the inevitable pressure and influence of circumstances. Hence in all co-operative enterprises, such, for instance, as a creamery or cheese factory, there is a constant effort to equalize the burdens and the benefits, but it is clear that this process of equalization has not yet been perfected.

Then we may inquire, 1, how and to what extent inequalites exist, and, 2, in what manner they may be removed or adjusted. The former question is more easily answered than the latter; but yet in considering it carefully and intelligently some clue may be given to a solution of the latter.

Will a certain quantity of cream from one cow make the same amount of butter that the same quantity of cream from another cow will, under similar conditions? This question is to be considered from a view of different cows of the same breed, and cows of different breeds. Hence it relates to cows and to breeds.

No doubt cows vary very much in character as to quality of milk, which is the only point that need be considered, quantity not being an element in the question. Every man or woman who has kept and milked any two cows knows this to be a fact. It may be taken as indisputable. But is this difference of sufficient importance to amount to an injury or injustice to some of the patrons of a creamery, and to a gratuitous advantage to others? I think it is unquestionably. My own experience during several years, carefully noted and recorded, has proved to me that the actual value of cream for butter product varies considerably in cows of the same breed; and also that the cream from one cow, churned alone, will make less butter than the same cream will when churned with that of other cows; the difference between the two depending not only on the actual quantity of butter in the cream, but on the condition of the fat by which it is more perfectly gathered from the cream when helped by other cream. This difference depends upon the size of the fat globules, as well as their density and hardness. Some cream contains globules of much smaller size than those in other cream, and in the churning the smaller globules become attached to the large ones quite easily, and do not escape, ungathered, in the butter-milk. These smaller globules escape when the cream of the particular cow is churned alone. I have found such a difference in this respect as to amount to a loss in keeping the cow, so large a portion of the butter escaped from the churn in the butter-milk. The cream of some cows may be churned in five minutes. This is because the globules are large and the fat is soft and adherent; that of other cows will require 30 minutes or more, the difference being due to the smallness and hardness of the fat globules. But if these different creams are mixed, the time of churning may be 15 or 20 minutes, or even less. I have had butter fully gathered in eight minutes from mixed cream from which, when churned separately, the butter came in various times, from five to 30 minutes. And this was from cows of the same breed, Jerseys; but they were of different ages, the quick-churning cream being from a young cow, and the slow cream from an old one.

These facts seem to show that an important advantage is gained by the creamery system, that in no way whatever affects the interests of those who do not gain anything, taking the ordinary method of separate churning as a test of the value of the cream. The method of Prof. Short, which secures all the fat from the milk by a chemical test, would do justice to many cows that would be condemned by the churn test. But it cannot be doubted that the cream of different cows does vary considerably in its actual value for butter product. Cream has been found to contain, in different samples raised under the same process of setting, from 50 to 72 per cent. of water; from 19 to 43 per cent. of fat; and from 8.80 to 14.75 per cent. in caseine, where the quantity of fat was the same in two samples. These cases were of cows of the same breed. I am well satisfied that these variations may exist in cream without any apparent visible differences, and chemical examination alone can detect them.

As to breeds, there is still greater certainty in respect to differences in value of cream for butter. I well remember a test made several years ago in a dairy of pure Ayrshires and Jerseys, which showed that while the cream gauge indicated 33 per cent. of cream in the Ayrshire's milk and only 25 per cent. in that of the Jersey, the latter cream made one-fourth more butter, for the same quantity. It is well known that Jersey cream is made up of larger globules than Ayrshire cream is, and consequently the latter cream would necessarily contain more milk, hence be less rich in fat. This peculiarity of the Jersey is shared by the Guernsey, and by some of the best native cows which I have tested in this respect; while that by the Ayrshire is shared with the Devon, Dutch and Short-horn. No doubt there are cows of any of these breeds which are exceptional, but the influence of breed upon butter products from equal quantities of cream is so distinct that I am sure that if one dairyman were to use a good pure-bred Jersey or Guernsey bull in his herd and rear the calves to cows, and used the grades in his dairy and sold his cream to a creamery at so much per space, and another did the same with a good bull of any other breed, the former would contribute largely to the pocket and prosperity of the latter in every case. Differences of individual cows are equalized in a herd of the same breeding; but in herds of different breeds, the natural inequality must always exist.

Consequently the system of co-operative butter making, in which cream is bought by measures or spaces, cannot fail to be unjust to the contributors who have better cows of any breed, or cows of a better breed than the others. And the only remedy for this inequality is a perfect test of the actual quality of the cream of each herd to fix the value, which may remain constant under equal systems of feeding, and of setting the milk for cream.

Macon County, N. C.

FROM T. D. CURTIS.

The question is asked: "Co-operative dairying, where milk is received as though of equal value, is certainly unjust. Is not the system where cream is received by gauge more or less so?" I answer, it certainly is, and efforts have been made for years to get a test that will give the true butter-making value of cream. The first was the Schock & Bolander churn. Then followed the oil-test. Later we have Prof. Short's test by first saponifying the cream. But the last two, while giving the amount of oil or fat in the cream, do not show how much of it is available as butter by churning; hence, I consider the churn-test the most reliable. When it was first discovered that "cream is not cream" of the same value in all cases, a noted test was made at West Liberty, Iowa, where the cream of each patron on a large route—some 70 in number, if I remember rightly—was tested by taking a gauge that it had been assumed would make a pound of butter, and churning it in a small jar. The result showed that while the gauge of some samples of cream made only eight ounces of butter, that of others made 24 ounces; but the average was 16 ounces. This made the creamery all square, but robbed the 24-ounce man of 50 per cent. of his dues to make up for the lack in the eight-ounce man's cream, which had 100 per cent. added to its value! This difference in the butter value of cream is now so well understood in the West that no creamery, that I am aware of, is run without applying some test of value for every man's cream.

There are several causes for the difference in value of the cream of different cows and different herds. The cream of some cows is naturally richer than that of others. Breed, feed, care and shelter or no shelter, have their influences. A sudden change in the weather, from cold to hot, or hot to cold, varies the quality. Let a cold, wet spell strike a herd of cows running in the pasture, and they will not only shrink in their mess but give milk of inferior quality, the effect extending to the cream. The cream of the milk of the same cow varies from day to day, without any apparent reason. A cow that comes out poor in the spring gives poorer milk and cream than she would if she came out in good condition. A poor, half-starved herd gives poor cream, that turns out poor white butter—butter having less nutritive qualities than butter made from the cream of well-fed cows. Hence the wrong and injustice of artificially coloring butter, as it enables the dairyman who has a herd of poor, half-starved cows to get just as much for his butter as is paid for that of a much higher nutritive quality. As a rule—with perhaps some exceptions, but I know of none—the well-fed cow, which gives rich cream, that makes highly nutritive butter, also gives it a nice if not a high natural color. This fact is sufficient argument against artificial coloring. The natural color of butter largely indicates its quality, all other conditions being the same. But while we are in a measure approximating justice in the creamery or butter factory, we are going on in the same old way in the cheese factory.

Some advocate the oil-test. But while this may closely decide the amount of fat in the milk, it does not show its real value for cheese-making, since there is more variation in the per cent. of caseine than of fat, and a low per cent. of fat may accompany a high per cent. of caseous matter. There is still a lack of equity in all forms of associated dairying. This points to the ultimate carrying on of all dairying in large, well-conducted private

dairies. I may add that the size of the fat globule has much to do with the butter value of cream. The larger the fat globules, and the more of them, the higher the butter value of the cream; while the fat globules may be so small that few of them can be churned in-

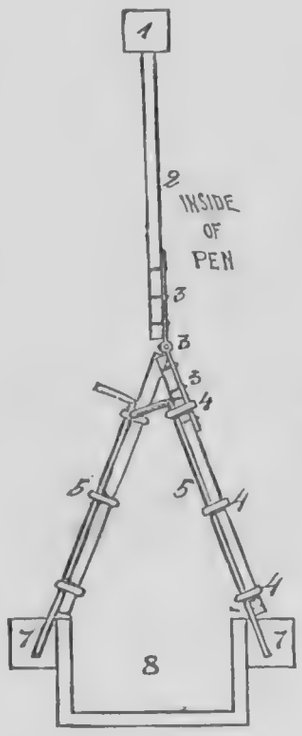

Fig. 165.

to butter, and hence are run off in the buttermilk. There are instances on record where no butter could be churned from cream or milk which analyses showed to be rich in fat. It seems strange that it takes so long for the general public to become familiar with well-known facts having a direct pecuniary bearing on the several different callings. But I believe the dairymen are the slowest of all.

WHAT TEN WOMEN DID.

It was at the meeting of the Ladies' Aid Society for April 1888. As is our custom, we lingered to talk a little while after the meeting had adjourned. No general subject had been started, when our president said:

"One thing, ladies: Please don't let us discuss the blizzard or the might-have-been of the pastor's last sermon!"

"Suggest something fresh, wise, and original!" said Sister Soule, in her sarcastic way.

"All right," returned Sister Ray. "We have just the right time to talk about the milk problem, which is agitating all the men-folks."

"If we could only think up a remedy!" I said, and three or four echoed the remark.

"I can tell you my idea," said Mrs. Ray.

"But excuse me," Mrs. Orr said. "I do not understand what you are talking about," (she had but just removed to town.)

"Why, it's the milk," said half a dozen at once. "You see we've all been sending to the condensing factory, and getting two and three-quarters cents the year round. But they shut down on April 2nd., and now there is the general query: 'What shall we do with our milk?'"

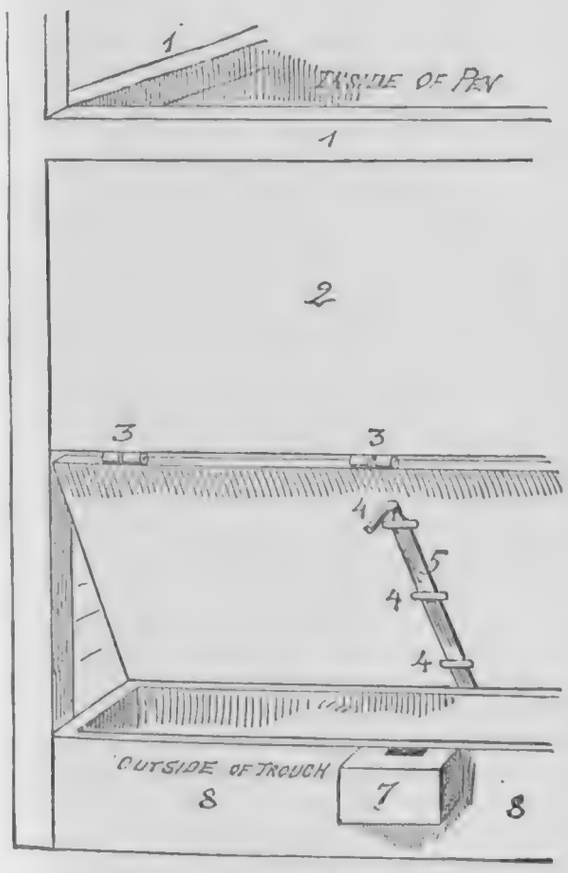

Fig. 166.

"Send it to New York, and get two cents; to the cheese factory, and get 2 1-10th cents; to the whole-milk factory, and get still less?" rattled Sister Soule.

"Yes, that's just it!" we all said. "It is impossible to hit upon anything to take the place of the condensing factory!"

"Unless folks start a co-operative creamery," said Mrs. Edson.

"Which they will not!" said the president. "It is *the* thing, but it won't go."

"Unless we make it," said Sister Ray.

"How?" asked Gran'ma Esty." Those that know say we can't start one, ef fur no other reasin, cos it wouldn't be nowise pos'ble to git a buildin' up in time."

Mrs. Ray smiled.

"See here," she said. "Of the 28 dairies on this side of the creek that furnished to the condensers, 13 can be controlled by women, and eight or 10 of those women are here today. Now, can't we organize?"

"How?" I asked.

"Well," she said, "buy the outfit and—"

"Fit out what?" asked Mrs. Soule.

"The building is ready," she said. "That is our new horse-barn. John will not use it till winter, if I say so, having the old barn. The basement under the carriage-room is all bricked, and the ice-house at one end is full. We can fit it up nicely for a creamery."

"At what cost?" some one asked.

"For $100 to $150," she said. "Here are the items:—One 150-gallon cream-vat is $60. A No. 6 Davis swing churn is $18. A No. 3 Eureka worker is $10. A Nesbitt printer is $5. That is $93, and all else put together will not make it exceed $150, including the minor fixings, drains, and carpentry."

"Well!" was the general exclamation. And it was well. In an hour we had organized a Ladies' Creamery Association, capital $500, divided into 50 equal shares. Three-fifths were "signed" on the spot, and the remainder in four days, and all by women, too.

John Ray's new barn was "just the thing." Built on a side-hill, it had a basement 30x48 feet, which was originally intended for a pig-pen. This was divided into work-room, cream-room and storage-room—the ice-house adjoining, and no boiler-room provided, as we decided to "run it by hand." The outfit was put in, and all in order, for $132.65, each patroness buying her own Cooley creamer. The building was rent-free; the drainage was put in free, and we agreed among us to take turns butter-making and cream-collecting. "We" were ten women, all "good butter-makers," and representing a total of 118 cows. It is but fair to say that the men let us have our way (though they laughed some), and that we got along without their help altogether, except that we had to have the ice-box filled for us, and the milking done by men. All of the rest we did ourselves, assisted by the dog of one of the patronesses, which was employed to churn for us. A as butter-maker, and B as cream-gatherer and assistant, would take charge one week (beginning May 5), then C and D would take charge a week, and so on around. All had a voice in things; but Mrs. Ray was president, I was secretary and sales-agent, and Mrs. Fox was secretary. The 10 "directed" as one. Everything was otherwise conducted as in any co-operative Cooley Creamery.

We discontinued operations early in November. Now I might proceed to tell how profitable it was—for it was so—if it were not for one thing, and that was that we all agreed "neither to boast nor whine, whatever the outcome might be." But it *paid*. (The commission merchants did not, however, until I had a lawyer's help.) Last March, on the occasion of our annual meeting, the men came in and proposed a "General Creamery." Let me say, with all candor, that we graciously admitted them, being satisfied with having shown them that with small capital and lots of pluck, 10 women can settle the "milk problem." It is not my purpose to write of the present association, their organization, new factory, etc. We made it possible: that is all. One word to farmers' wives: If there is no creamery in your town, believe the general opinion that it pays, and instead of waiting for the men, *go ahead!* MRS. L. C. M.

Westfield, N. J.

Entomological.

THE WIRE-WORM NUISANCE.

READERS of the R. N.-Y. are requested to pass along several rows of their potatoes and see if here and there stems with curly or wilted leaves be not found. If so, let them remove the soil from each stem near the surface and two inches in depth. If the leaves are merely curled, it will be found that a wire-worm (millipede) has eaten the stem so as nearly to sever it, or that it has bored into the stems in which case the grub may be found within the stem an inch or so above or below the orifice. Large, strong stems may be eaten nearly in two, and yet present a green appearance. The curl in the leaf is the first evidence that the stem is so nearly severed that it can no longer convey the required amount of sap to the leaves and stem above. The stem often begins to rot after the "wire-worm" has attacked it, in which case the vine falls over and dies. For the past two weeks the writer has examined many plants thus injured, not only at the Rural Grounds, but upon neighboring farms, and there is little doubt that it is these many-legged insects (Iulus) which are the cause, though a number of farmers ascribed it to "blight" or the excessively wet weather that has up to this time prevailed. In one patch of potatoes, 12 in a row of 66 plants showed either the curly or wilted leaf, while two entire plants had fallen over, the stems having rotted apart. The illustrations, Fig. 167, will show the reader one of these stems and the character of the injury sustained, while Fig. 168 shows the appearance of the stem just below the ground.

We have found not alone the hard "wire-worm" which seems to be made of hard rings closely joined together and which curls up like a spiral wire as soon as touched, but also the softer, more active grub, at work, both on the outside of the stem and on the inside. As many as five of various sizes, from a quarter-of-an-inch long to the mature grub have been found in one stem.

The R. N.-Y. would like to learn through its readers if these larvæ are at work else where upon the stems of potato vines, or if, owing to local causes, their depredations are confined to a limited a rea.

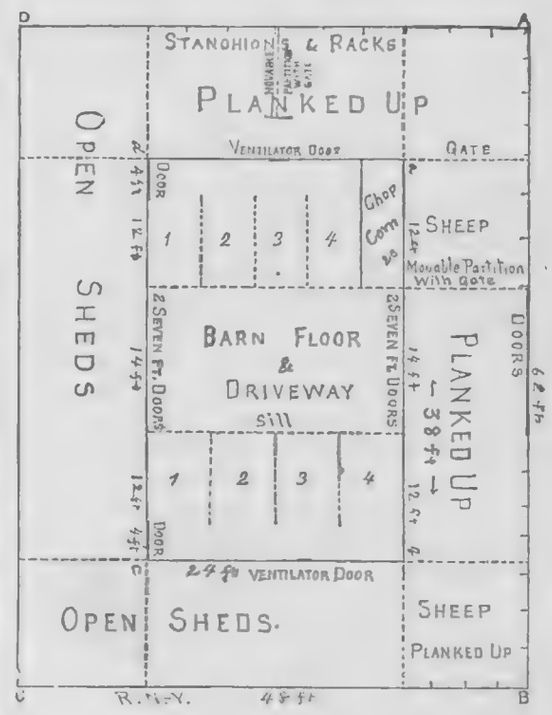

Fig. 169.

The entomological name of the wire-worm that coils up upon being touched is Julus Canadensis. That of the other is probably Scolopocryptops sexspinosa.

WORK OF THE CUT-WORM ON POTATO VINES Fig. 167.

The Swineherd.

HOG TROUGH DEVICE.

THE device shown at Figures 165 and 166 may be an old thing to many of our readers, yet we are led to print it from seeing the numbers of hog pens that are without any handy means of pouring food into the trough. Figure 165 shows a side view of the hanging door, while Fgure 166 shows a front view. The pictures show the working of the device without much explanation. No. 1 is a joist forming the upper edge of the pen; 2 is a boarded space; 3 are hinges on which the door swings; 5 is an iron rod; 8 is the trough and 7 is a slot cut in a block. To feed or to clean out the trough, the door is swung back, and the iron rod 5, is pushed down into the slot 7. This keeps the hogs away from the trough until the feeder is ready for them, when the door is swung back and the iron rod pushed down into the slot at the front. This is a great deal better than trying to pour the feed over the side of the pen.

Architecture.

A CONVENIENT VIRGINIA BARN.

WHEN I moved to this farm there was no barn on it. As I was a young man, and just

Fig. 168.

beginning the business of farming, every one had something to say about what kind of a barn I ought to build. I was somewhat like the Dutchman who invited all his neighbors to a big dinner, after which they were to tell him where to "set his barn." After dinner each neighbor had a different place and plan

whereupon the Dutchman said: "Now dake yoursells home. I sets de parn shust vare I please." So I set to work to build a barn of suitable size and of convenient arrangement, keeping in view both the size of the farm, the amount of farming I proposed to do, and also, the latitude of the country where the farm is located. Of course, I especially make a note of these two facts for the benefit of other young farmers who may begin operations on a run-down farm—it is not wise to build too large a barn on a small farm, nor to double-board, felt-line, and "dig out in a hill" a barn for the ordinarily mild climate in this section of Virginia. Colts, cattle and sheep do very well in this climate running in the fields all the winter, with the exception of periods of storms, winds and sleets, which seldom last more than 24 hours, and in most winters we rarely have to feed much before Christmas. Taking into consideration these facts, and others which I may at some time refer to, I hit upon the following barn plan. I will give exactly as I built from it, pointing out my mistakes, so that other young farmers may not fall into the errors of my way, should any one ever decide to adopt the plan shown at Figure 169.

The main building is 24x38 feet with 15-foot posts, (the posts ought to have been 20 feet) with a 12-foot lean-to all around. The ground-plan is drawn on the scale of one-eighth of an inch to the foot. The capacity of this barn is eight stalls for horses, four of them are roomy for harnessing work horses, and four smaller for horses, or colts, that are not worked. The sheds which are planked "up or down" on the north or west sides, will hold 50 calves and 100 sheep. The cows find ample shelter and protection under the open sheds on the south side and east end. The closed sheds are furnished with stanchions, along the outer walls, also with gates for partitioning them off. The loft is all one open area, extending over the main building and sheds, and is closely laid with straight-edged planks. The design of the ground-plan and loft, will be better understood from the following diagram. The joists over the stalls are seven feet in the clear; the joists over the shed six feet in the clear, at the outer end. The loft of the barn floor is closely laid with planks, with the exception of a six-foot opening through which the hay is to be taken up. The hay loft will hold 102 loads of clover hay. The hay for the horses and stock in the barn-yard is all thrown down on the barn-floor, thus saving waste; the hay for the stock in the closed shed is thrown down through a 2-foot opening left all around the outer edge of the loft right over the stanchions and rack. The barn floor is fully large enough to contain bedding for the horses, or to hold lambing ewes on sleety nights. It will be seen that the fighting or master calves can be stanchioned, and the others left free, so that nearly twice the number can be housed in the same space. There is a drop of one or two feet where the lean-to joins the main building. This is a comfortable and convenient barn, I think, for a farm where 100 acres are annually cultivated. Any mechanic can readily make out a bill for the lumber. G. C.

Montgomery County, Va.

Educational.

"WHAT ARE AGRICULTURAL COLLEGES GOOD FOR?"

NO. II.

PRESIDENT W. I. CHAMBERLAIN.

In my first article on this subject I said that Prof. Porter seemed to me to write without sufficient knowledge, or at least recognition, of the great difficulties which our agricultural colleges have to overcome. Let me mention a few of these.

First comes the reluctance of farmers' sons to study agriculture and of their fathers to have them do so. As President of a college that has 300 students in its four classes, I have a pretty good chance to observe. Except the engineers, all male students are required to take the equivalent of three lectures or recitations per week, the first two years of the course, in agriculture, including horticulture and stock-breeding. I am besieged with requests to excuse students from these studies and always refuse. I once nearly lost the good-will of a prominent trustee, *a large farmer*, by refusing to excuse his son from the class in stock-breeding. He didn't like the book, written by one of our foremost live-stock writers. He didn't like the teacher, one of our own graduates, a man of much experience in fine stock-breeding. He said his son could study it as well at home, where the chief business was buying, feeding and handling steers. He wanted him to have Algebra, Geometry, Rhetoric, History, Latin and such like studies. I told him that, if I excused the son of the Chairman of the Trustees, (as he was then) I should establish a precedent that I must follow for every student that asked, and that would be a practical abandonment of agricultural instruction, the very thing the college was endowed to give. This is one of many cases. The very farmers who shout that we are not agricultural enough, send their sons t classical colleges, or if they send them here demand that they be excused from what we require of all in agriculture, horticulture and stock-breeding. Even among the pure and applied sciences those that squint most sharply towards agriculture, like Entomology, Structural and Pathological Botany, Comparative Anatomy, etc., seem less popular with farmers' sons than Calculus, Physics, Astronomy, Psychology, Political Science and the like. Quite a number of the present Senior Class have now a petition before the Faculty to take German next term instead of lectures on Veterinary Medicine and Surgery, under one of the keenest, most interesting veterinary surgeons in the entire West. We have the farmers and their sons *to convert*. Even in the Michigan Agricultural College, for years the main trouble has been with the agricultural studies proper, and the field and garden practice.

Now I mention these facts, not to urge that we should give up agricultural instruction, as Prof. Porter advises when he says: "If you cannot learn agriculture at a college, there are *other things you can learn* which will be *even more important*." No, that would be misuse of trust funds. But I do mention them to show that Prof. Porter and others do not recognize the odds against which we work, and to show that it is *not* true that "all who come here intend to be farmers," and that the "agricultural college takes them away from the farm." The trouble lies further back, in the heresy, preached by Prof. Porter and believed by most farmers, that the thorough scientific education given in an agricultural college will not make a man a better farmer if he follows farming with zest; that "agricultural papers and reports of experiment stations tell farmers all they need to know about theoretical and scientific matters appertaining to agriculture." Acting on this heresy, the boy that *is* to be a farmer is kept at home and the boy that *isn't* to be a farmer is sent to an agricultural college to fit him to be something else! And acting on this idea, he and his father often insist that, so far as may be, he omit all studies that smack too much of the farm.

Another thing closely related: Boys come from the farm to college to learn what they do not already know. They think they know all about farming, and hence don't want to learn. Then, too, the deeds of deftness on the farm are going out as machinery comes in. It takes as much knack and training to mow a smooth swath, to cradle grain, rake and bind, shear sheep and chop wood, rapidly and skillfully, as it does to lay brick, case doors, plaster, paint or hang wall paper well, or run an engine-lathe or locomotive. Scythe-mowing is a lost art on the wide prairies. We can't find a student who can do deftly these things of hand-knack, and if we should require here the drill needed to give deftness in these old hand processes, the students would leave college. They come to study science, underlying principles, as a rule, not farm processes. These so far as needed and as adapted to present tools and machinery, they get or should get at home. The difference is not, as Prof. Porter says, that "everything that can be called a profession or trade depends on scientific attainment or acquired skill; an apprenticeship of some kind must precede capable work in every kind of mechanical occupation," and that this is not so in farming. The boys on the farm, as Prof. Porter says, get, or should get, knack, apprenticeship. They do not get underlying principles. These they can get at the college, and these, I maintain, are as essential to the highest success in farming as in law, medicine and divinity. Farmers have hitherto not had this drill in principles, in related sciences, and hence have not ranked socially or in success with educated men in the professions or in business.

One Thing More:—Scientific training in other callings gives foremanships and the position and pay that come from the superintendence of labor. But from the youthful and crude condition of agriculture and agricultural colleges in this country, such paying foremanships are not yet largely offered to graduates, as in Europe. But our agricultural college graduates are now finding many more such openings, in breeding establishments, and as experimenters in stations, and as instructors in colleges, in nurseries, greenhouses, in management of country estates of rich men, in landscape gardening, etc. And to those who are at all wise, the partnerships in large fruit, grain and stock farms, between the father with his business and farm experience, and the son with his scientific knowledge, should always be most inviting ones. I *know* that the education given in the agricultural colleges of Michigan, Massachusetts, New York, Mississippi, Missouri, Texas, Kansas, Colorado, Iowa and other States makes the graduates better farmers and broader men, and that in nearly all the Land Grant colleges the instruction towards the mechanic industries has been admirable.

Second:—I am to consider the wisdom of the changes proposed by Prof. Porter. His plan is: "First, turn the agricultural colleges into schools of general culture, assimilating their courses of study largely to the academical courses in regular colleges." To this I am totally opposed, because, first, as already stated, I regard it as a clear diversion of trust funds from their true intent; second, because I should regard it as a retrograde move. The old "academic course" was largely barren of results in science and the industries; and literature and the professions were comparatively overstocked. Since our course of study was laid down in this college, 20 years ago, the "academic course" has, by the spirit of the age, been driven towards us tenfold more than we have been drawn towards it. And the great majority of the recent immense endowments have been for schools, colleges and universities of technology and practical and applied science, rather than for those that have the "regular academic course." As David said of his child, so may the "regular colleges" say to the scientific and technological colleges; "We shall go to them, but they shall not return to us."

Prof. Porter's second proposition is:

"But do not take the boys away from the farm even to learn these things. Let them understand that they can be just as much gentlemen, in the true sense, on the farm as in other pursuits, and that culture is just as useful and just as ennobling there as elsewhere. To this end let the college course be arranged so as to consist of at least four to six-months' winter terms, leaving the summers entire for other uses. The advantage of this arrangement would be that the boy would not be taken away from the farm long enough to acquire a distaste for it and a disposition to lead an easy, effeminate and, as he thinks, gentlemanly life. In fact, he would not be taken from the farm at all. He would be there every summer, and all summer long, helping his father with the extra zest and the acquired manliness that his winter's opportunity had given him."

But could you teach the boy as much of agriculture and related sciences in four months of winter? We here have eight months of summer for a purpose. To teach botany we want the plants in growth and bloom. To teach entomology we want to watch the bugs (insects) in their various stages of development, while they are developing; that is, in spring and summer, not winter. To teach the uses of insecticides and the modes of spraying, we need the students in summer when the coddling moth and the cabbage worm and chinch bug are abroad in the land. In short, the deductive, "cloister" studies that need only book and brain, like Latin Calculus and Mental and Political Philosophy, can be studied on Prof. Porter's plan. The inductive and industrial sciences, that use objects, field work, growth, development, manipulations, these things require in part the summer and the open air.

Prof. Porter continues:

"Thirdly. Turn the institutions now called agricultural colleges into farm schools and experiment stations during the summer. In these let every branch of agriculture be carried on and illustrated in the best possible manner, and let the work be done of preference, and, as far as possible, by young men who desire to become proficient in practical agriculture. Let these young men be paid as much as other men would be for the same amount of work."

This is good in part. It is just what the best of our agricultural colleges are now doing all summer, in connection with their regular instruction in underlying sciences. But this contradicts and subverts Prof. Porter's idea of leaving the young man at home six or eight months of summer! But if these "farm schools" are to be carried on for illustration and instruction, I doubt the propriety of paying the students *for the instruction they receive*, as advised in the last sentence of the quotation. If they are working to make money for the college or the State, then pay them. If they are working *to get instruction for themselves* out of the experiments tried, then why pay them for receiving this knowledge, any more than for experimenting in the chemical, botanical, physical or entomological laboratory or dissecting room, or in military drill of the college campus? The moment you single out agricultural and horticultural experimentation, and pay the pupil for what he learns there, and yet *make him* pay for material used in the chemical laboratory, that moment you degrade the agricultural experimentation into commercial farming, and make your student a common unskilled laborer and not a learner. The student must be put where and at what he can *learn* most; the paid laborer must be put where and at what he can *earn* most.

It is a long and difficult task to lift farming from an illiberal labor to a liberal profession; to make it an applied science, a skilled art instead of an empirical drudgery. It will be long before the bulk of the farmers "manure with brains." Never will farmers rank socially and financially with those that have studied far more than they in their own line of work. They will not be induced to study underlying sciences by telling them, as Prof. Porter does, that "the agricultural papers and reports of experiment stations tell them all they need to know about theoretical and scientific matters appertaining to agriculture." As well burn theological seminaries and law schools and medical colleges and let young men of no education and no special training enter these professions trusting to the religious papers, and the law and medical journals to "tell them all they need to know" about preaching, pleading and practicing.

The agricultural colleges are trying to meet the problem as well as they can. But it is new and untried work. The oldest of these colleges in this country is but a trifle over 20 years old; while the colleges that train for the learned professions and for literature have existed for centuries. It really does not seem to me that Prof. Porter has helped towards the solution of the problem.

Agricultural College, Ames, Iowa.

RURAL SPECIAL REPORTS.

California.

Pleasanton, Alameda County, June 5.—The Rural arrives regularly, and it gives me pleasure to say that the longer I keep it the more highly it is appreciated. Haying is nearly over, with a good crop on volunteer lands. The late rains damaged early cut to a considerable extent; but the prices for that cut later, will probably be low. Grain is ripening fast with the promise of a fair crop. Reports from other parts, are that the aphis did some damage to late-sown Chevalier barley, which is the best-paying grain crop in this county. Prices rule low for all produce, excepting buckwheat. Fruits of all kinds are plentiful with the exception of Moorpark apricots and some varieties of peaches, which were affected by the curl-leaf. Land is held at very stiff prices, from 300 to 500 dollars per acre being asked for good valley lands. At that rate a man without the necessary capital to buy outright, would have to work and slave a life-time to clear 150 acres.

J. C. M.

Delaware.

Dover, Kent County, June 18.—We have had a vast amount of wet weather of late and the effect of it will be felt during the entire season, especially in sections where the land is low and wet. Harvest commenced yesterday, but the bulk of the crops will not be cut till later in the week or probably next. Wheat on high land is apparently a fine crop, but much has been hurt by water. Some complaints of scab or blight are made, but I think the trouble is not bad enough to affect the crop. We are behindhand in haying. Last week was the proper time for cutting clover, but none was cut on account of the weather, and the present prospect is that this week will be but little better. Anyway the wheat must be attended to even if hay is neglected. We have had but little hot weather but an unusual number of thunder storms. Some damage has been done by lightning. Corn looks fairly well on high land, but on low land there has been so little time dry enough to work it that the weeds are about to take the lead. Some of us on high land are cultivating our corn for the third or fourth time while the crop is from one foot to three high; but this does not apply to half of the crop in the county. Some few fields of oats look fine, but the greater part of the acreage sown looks injured by too much wet. Strawberries were a fine crop, but growers realized very poor returns for them. So far as this section is concerned, the peach crop will be very light; but a full crop is reported farther down the State. The rose bugs have been here in countless multitudes destroying about all of the grapes and not a few peaches and apples. Early truck is plentiful, and potatoes are large enough for use. The hay crop, even if housed in good shape, will not be up to the average. What we most want at present is good weather for a week or so; otherwise many a farmer will meet with serious losses.

A. G. S.

Illinois.

Dixon, Lee County, June 17.—Farmers hereabouts were invited by the Anglo-Swiss Condensed Milk Company, of this town, to assemble on June 1, and make and sign contracts for milk for the year, and the period for doing so expired on June 15. The contracts were to run four months. The prices for milk were to be on a basis of 90 cents per

cwt. for six months and $1.30 for the other six months, making an average of $1.20 for the year. It was a new undertaking here, and consequently some of the farmers were slow in taking hold of it. The first milk will be received on the evening of July 8, and the milk from 800 cows has already been contracted for. The company will run only one vat or pan at present, for they must have the milk from 10,000 cows to enable them to run to their full capacity. The heavy parts of the outfit are already in place, but an immense amount of light machinery is now being put in. The present pay roll amounts to $2,000 a week for the mechanics and laborers. The general manager says $1,000,000 will not more than pay for it. An artesian well 1,700 feet deep is located within the factory and gives 400 gallons of water per minute. Another well about 600 feet northwest of the factory, is 1,600 feet deep and produces 600 gallons per minute. The weather is pretty wet. Oats and wheat are looking very rank. Clover is a good crop and will be cut by June 20. Corn has had a hard struggle with frosts and cold winds, but the outlook for the crop is very favorable now. Prices are: corn, 28 to 30 cents; oats, 16 to 18 cents; good butter, 10 to 12½ cents. I am glad to see that the RURAL is coming down on trusts, which are the enemies of the farmers in general.

J. W. K.

Kansas.

VIDETTE, Shawnee County, June 17.—The extreme range of the thermometer so far in this month has been between 60 and 98 degrees, with two inches of rainfall. Wheat promises to be very good. Oats good in straw; corn is making a good growth with a few exceptions where chinch bugs are at work. The abundance of rain we are having is a hindrance to the bugs and an advantage to the crops. All kinds of fruit promise to be plentiful. Everything looks flourishing for the agriculturist. J. E. M.

Michigan.

MARLETTE, Sanilac County, June 18. Wheat, oats, barley, peas, horses, cattle, sheep and wool are our money products. They are sold at the elevators and shipped East. Some barley is fed to stock. All of it should be and no beer should be made. The farmer would then get more profit. The best of the white peas are sold to be used for the purpose of adulterating ground coffee, etc. We have a good cheese factory that makes an excellent cheese, and also a creamery; therefore some are paying greater attention to their cows and increasing the number of them, and with the aid of the silo, the prospect is fairly good. An oat-meal mill is nearing completion here. It is said to be the only one in the State. Prices at present are: Wheat, 77 cents; oats, 23 cents; barley, 50 cents; peas, 40 cents; wool, 15 cents to 32 cents. Some farmers have a better grade of stock, are better feeders, and obtain better prices. Then by cleaning their seed grain thoroughly, sowing their seed early on carefully prepared soils, they generally have paying crops. I do not know of any that are making any one branch a specialty. I have been paying more attention to sheep than to anything else. I have a flock of Shropshires, also Merinos, and some half-breeds. I filled my silo with uncut corn; and fed the silage to horses and cattle. They ate it all up, but the sheep did not eat all they got of it. I should prefer cut fodder for sheep. Of late years many have been reading the R. N.-Y. and several other valuable papers, and they have improved much in the general management of their farms, and appear to prosper, in spite of hard times. Many herds have been much improved by the introduction of Short-horn blood. Farmers have good teams and are raising good colts. I think those farmers who have not tried growing peas, should do so. They leave the land in good condition for fall wheat; the straw is good sheep fodder. Two or more acres sowed with rape make a good pasture for sheep in the fall. Last year I had four acres of rape sown broadcast, five pounds per acre, in June, and found it a great help towards getting my sheep in good condition for the winter. The great thing to bring prosperity to the farmers would be Prohibition. It would give us a better market for our grains. Instead of the low price given by the Brewers' Trust we would get the fair price regulated by the demand of the people. If there were no liquors, there would be more money in the hands of the poor, and consequently a greater demand for our products. This would, of course, increase the sale and the prices would go up.

J. M.

ROLLIN, Lenawee County, June 17.—The cities are increasing in population faster than the country and must be fed so that the outlook for the future is brighter. The temperance question will not rest until it has been settled right, and then there will be more money to spend on nice fruit and good meat. There are some farmers here who are getting extra good prices for their products. A number of men are sending their butter directly to the consumers the year round, and getting 20 to 25 cents per pound for it all the time; whereas it brings now in our local market only 11 to 12 cents. Some introduce new kinds of wheat, oats and potatoes, and sell them for seed at a large advance on the market rates. Some raise blooded cattle or sheep or hogs and sell their progeny to farmers at better figures. The following changes have been made within 10 years: Hay is now baled and shipped as far as to New York and Boston. Now we have canning factories in many villages. We raise sweet corn, tomatoes, squashes, pumpkins, berries, etc., more than we used to do. Our farms are small; more of them are under 80 acres than above that figure. Quite a large number of our farmers sell more or less wood or timber every winter, and maple sugar making in the spring is an increasing industry. In fact our resources are great and varied; if this were not the case we never could bear the strain that is upon us, what with monopolies and trusts, sharks and tramps, floods and frosts, drougths and taxes. We still, however, survive. Though often down, we are seldom in despair. J. O. B.

Minnesota.

MENTOR, Polk County.—Considering the unfavorable conditions our grain crops have had to contend with this spring, it is a wonder that the small grains look so well as they do. We have had the driest spring in the history of this settlement. Unusually heavy winds have blown a large amount of grain out of the ground and in a good many places it was necessary to seed the ground all over again. Heavy frosts, too, about the first of June thinned out the oats somewhat, but what there is left now is doing remarkably well for grain that has not had a thorough wetting since it was planted. Pastures are very short and dry. I have never known the cows to do so poorly in June. Creameries are paying 10 cents per inch for cream in cans 12 inches in diameter. It is hard to dispose of stock at any price for cash. What little money there is in the country seems to be in the hands of loan agents. Unless we have rain soon our hay crop will be very short. There has been a good deal of comment among the farmers in regard to the Meat Inspection Law. Most of those I have talked with do not seem to be able to see anything beyond the 50-cent inspection fee, and are growling at our lawmakers for putting another burden upon the already down-trodden farmer. Before the Inspection Bill passed meat was hard to sell at 2½ cents per pound on foot; now it is rather easier to sell it at the same price, and that is about the only material difference we have been able to see thus far. F. A. H.

Nebraska.

SIDNEY, Cheyenne County, June 18.—Cattle and corn are the main branches of industry, which farmers depend on for cash. These products are sold here (Sidney) except cattle, which are shipped to Omaha. Prices have been very high for corn, etc., but low for cattle, but prospects are favorable for the future. A few by having good stock and raising a good quality of produce get extra good prices. The land here less than five years ago was all used by the cattle-men. The immigration to this part of the country has changed it from a grazing to an agricultural section. One of the best changes for the benefit of this country would be to import a high class of pure-bred cattle and horses to improve the stock that is here. J. D. B.

New York.

PRATTSBURGH, Clinton County.—Developments since the frost of May 29th show a fair prospect for currants and berries of all sorts on my premises. There will be very few pears, no grapes, plums, peaches, quinces or cherries, with a prospective yield of apples, from over 200 bearing trees, that I would willingly exchange for five bushels of sound fruit in autumn. Hay a light crop in this region. Winter and early-sown spring grains on dry land are promising. Corn backward and sickly. As a whole, the present prospect is against a recurrence, this year, of any complaints about over-production. W. B. P.

Ohio.

LODI, Medina County, June 17.—Wheat and milk are our money products. Wheat is sold to warehousemen and milk to the cheese factories. Wheat has averaged about 80 cents per bushel; milk 80 cents per cwt. There appears to be no prospect of better prices in the future. There are farmers who get prices above the average. They excel in the quality of their goods, are reliable, honest and "square" in every line and they sell to those who know and appreciate good things. There has been some change in a few localities within 10 years. Potatoes and horses are raised more than formerly. Low prices for buckwheat have probably caused the change. I. W.

KILLING SNAPDRAGON.

A. R. Q., Farmingdale, N. Y.—Does the RURAL know of any way to kill snapdragon? The more I turn it under the better it appears to come up.

FROM W. J. BEAL.

I think there is no royal way to kill troublesome weeds; but thorough cultivation will subdue any plant. If it is not allowed to get a leaf above ground for even a short period, it must die. Linaria vulgaris is no exception to the rule.

Ingham County, Michigan.

FROM W. B. PRATT.

I am not conversant with "snapdragon;" but a farmer a few miles distant describes it as an annual, with bushy tops, pale yellow flower, growing only on wet land bordering on rivulets, never invading uplands, nor increasing under neglect in its natural home. He assumes that continuous pulling year after year and the consequent prevention of the ripening of new pods would in time effect its destruction.—[It is a perennial.—EDS.]

Steuben County, N. Y.

FROM J. TALCOTT.

I know of no way to eradicate any noxious weed except to destroy it root and branch. The worst pests are those that propagate from the roots. Those that grow from seeds only are much more easily destroyed. If the plot is not large, by digging it over and carefully picking out all the roots for a few years, all weeds must succumb. The more thorough the work, the speedier their destruction. The morning glory or India creeper is one that spreads from the roots and no cold will kill it in this latitude.

Oneida County, N. Y.

FROM DR. B. D. HALSTEAD.

This is a vile weed and it cannot be easily overcome. The snapdragon "butter and eggs" "toad flax" or "Ransted weed" takes almost complete possession of the soil. The only way to eradicate it is by frequent plowing and removing the roots. Keeping the plants closely cut will prevent the formation of seeds, but the plants themselves are long-lived. If the infested soil is turned frequently there will be an end to the trouble. How many weeks or months it will require depends upon circumstances. The weed killers must follow the illustrious example of the spider, and try and try again.

Middlesex County, N. J.

FROM A. A. CROZIER.

This imported weed has become exceedingly troublesome in all the Northern States east of the Mississippi and is spreading into other parts of the country. Besides the above name, it is known as toad flax, butter-and-eggs and Ransted-weed. It is said to have been brought to the United States by a Mr. Ransted of Philadelphia, probably for ornament, as it was often cultivated in flower gardens at an early day. It has become so common as a weed, however, that it is no longer offered by seedsmen. It occurs mainly along roadsides and in pastures, its fetid odor preventing stock from eating it. It is perennial, grows in continuous masses, and spreads by its creeping root stocks. To eradicate it I would suggest plowing the land deeply and carefully in June, and sowing to buckwheat or millet, following, the next year, with a hoed crop and remove any that may remain. In the West or in a dry season it could probably be killed by shallow plowing in July or August, setting the plow so as to prevent the furrows from falling flat, after the manner of breaking a prairie.

Iowa Experiment Station.

FROM PROF. H. H. WING.

Snapdragon or butter-and-eggs (Linaria vulgaris) is a perennial, spreading from root-stocks. It also produces an abundance of seeds. It is therefore a doubly troublesome plant to subdue. An absolutely bare summer-fallow or a positively clean hoed crop for two or three seasons in succession must kill it out. The question is whether it is worth the time, the trouble and the interference with rotation that such a course would entail. One or two other courses that give promise of success are open. The first is to mow the land early, turn the sod under, make the soil rich and fine and sow to millet or Hungarian grass. The success of this method depends on getting a quick and vigorous growth of the millet. A hoed crop should follow the next year. The second method is to pasture the land with sheep so heavily that they will be induced to eat every living plant. Of course, the sheep must have grain of some kind supplied to them. This method has the additional advantage of adding to the fertility of the land and I have known of instances in which it has proved efficacious.

FROM J. H. ACKLEY.

I am wholly unacquainted with snapdragon except as a flower in the garden; but the question gives rise to a few thoughts as to the management of pestiferous weeds on a farm. My experience with them has led me to believe that they can be wholly exterminated if properly treated, and I find the plow is the main tool to be used in their extermination. The next important point to be studied is at what point of their growth it can be used with the best results. Hence the nature of weeds one may wish to destroy, as well as their habits must be studied, and they should be handled when their growth is the most vigorous, and hence when they are most tender, for if they are severely dealt with at this stage of growth, they will receive the greatest injury. To illustrate this more fully, I give my experience with Canada thistles. A three acre lot became overrun with them. I fought them on all sides by hoeing and cutting them back; but all this seemed only to make them grow more vigorously. I came near giving up the field to them in despair. While in this mood, I began studying this matter and the thought of being beaten by a thistle made me desperate, and I resolved to fight the pests to the end. It was a newly seeded meadow, and there was a very poor catch when I "went" for them about the middle of June. They were so rank that I had to first roll them down, then turn them under, plowing deep, and I sowed the field to fodder corn. The weather was warm, and it grew very rapidly and got far ahead of the thistles. Again I plowed it early in the fall, sowed it to oats early in spring and treated it to a coat of 200 pounds of fertilizer to the acre, seeding it to clover. The result was a fine lot of oats, a good catch of clover, and a sickly lot of thistles that never headed out, and to-day the field bears as stout a lot of clover as anybody could wish for; while the thistles are so scarce that it is hard to find one. I have tried the same process on other lots, except that I did not plow the ground a second time until spring, and this I think preferable. Even if it is plowed in the fall it should be turned over again in the spring so as to make sure of the pests' destruction. This treatment can, I believe, be applied to any and all obnoxious weeds successfully.

Cattaraugus County, N. Y.

GROWTH OF POTATO VINES AS AN INDICATION OF YIELD OF TUBERS.

F. P. Q., New York City.—I planted some potatoes in trenches, according to the RURAL'S system, Mapes's fertilizer being used in the bottom of the trenches and also on top of the seed-pieces, which were cut to one and two eyes to a piece, planted on April 25, and covered with six inches of soil—a rich sandy loam. The day after planting there was a heavy rain. The vines are now three feet high, strong and stocky. I have been obliged to drive in stakes along the rows so as to tie the vines to them to prevent them from falling down between the rows, as I planted peppers there. The varieties planted are White Star, Early Puritan, Seneca Red, O. K. Prolific, Rose's Beauty of Beauties, Empire State, Early Ohio, Clark's No. 1, Queen of the Valley and Rural New-Yorker No. 2 The last was a long time coming up and is not so bushy in growth as the others. What sort of a yield is indicated by such a heavy growth of vines?

ANS.—Your fine vines indicate, in the R. N.-Y.'s opinion, a heavy yield of tubers. This is an old question and one which we have endeavored to solve. The R. N.-Y. has *never* raised a large crop of potatoes unless the vines were correspondingly vigorous in growth. As a *rule*, the crop of tubers will be proportionate to the size of the tops. This we have shown again and again by our published estimates as judged by the size of the vines at certain periods of growth. We can at this time show our readers 26 little plots which received at

the rate of from 440 pounds to 2,200 pounds of fertilizer to the acre. Without a single exception an increase of vine growth is shown by an increase of fertilizer. This experiment has been tried for eight or ten years and always with the result that the yield is proportionate to the size of the vines. When we have immense vines and small yields, it is due to some unfavorable condition. For example, if at *this* time you plant late potatoes in a rich soil, and the rest of the season prove favorable, you will have heavy vines but a small yield of tubers. Again, one-sided fertilizers, such as unleached ashes, have given us heavy vines and a small yield.

UNWHOLESOMENESS OF OLEOMARGARINE.

Reader, Fulton County, N. Y.—I noticed that Dairy Commissioner Brown made the statement that oleomargarine is indigestible, and, therefore, unhealthful. Is this the case?

ANS.—In the 2nd Annual Report of the New York State Dairy Commissioner it is stated that artificial butter is not a wholesome article of food on the following grounds:

First, on account of its indigestibility; second, on account of its insolubility when made from animal fats; third, on account of its liability to carry germs of disease into the human system; fourth, on account of the probability of its containing, when made under certain patents, unhealthy ingredients. The first and second points were arrived at by a series of experiments upon the artificial digestion of different fats. These fats were cod-liver oil, butter, oleomargarine butter, the commercial oleomargarine oil, lard oil, benne oil, cotton-seed oil, lard, and mutton and beef suet. The surprising statement is made that "rancid butter is probably more readily digested than fresh, and is not poisonous, the repugnance to it being simply one of taste." It is said that "lard is difficult of digestion." In support of the third and fourth points, a number of diseases are mentioned which are communicable from animals to man, and the methods are mentioned by which some of them may be communicated. It is stated that the heat applied to the fats employed in making artificial butter is not sufficient to destroy these disease germs. It seems to us that this is a very important consideration. The commission appointed by the Academy of Medicine at the request of the Prefect of the Seine in France, disapproved of the article on the ground of its indigestibility. It was never allowed to be sold in the public markets of Paris except under its own name, and its sale is now prohibited.

ABOUT STRAWBERRIES.

E. I. L., Speedville, N. Y.—I want to prepare as a strawberry bed a piece of ground which is infested with white grubs that work at the roots of the plants. 1. How can the pests be exterminated? 2. How deep should the ground be cultivated? What would be the best fertilizer? Would salt be of any use? 3. How much superphosphate, at the outside, should be applied per acre? Are ashes beneficial; if so, how much per acre should be used? How about hen manure? 4. What three kinds—early, medium and late—would it be best to plant? 5. Which are reliable firms from whom purchases can be made?

ANS.—1. The best way to get rid of the May beetle grub is to keep the land fallow and to dig it up or plow it the last thing in the fall or in midwinter if the land has become open and sufficiently dry. 2. Plow the land as deep as possible without bringing up the subsoil. We should not use salt. 3. Wood ashes (unleached) and bone flour are excellent. Instead thereof, muriate of potash, bone and sulphate of ammonia may be used. Two thousand pounds of a complete fertilizer may be used. If unleached ashes can be purchased at a reasonable price, use as much as two tons to the acre. In this case a thousand pounds of bone may also be used. 4. Crescent, Downing, Sharpless, Bubach and Gandy's Prize. 5. Ellwanger & Barry, of Rochester, N. Y., and other nurserymen who advertise in the RURAL.

RHEUMATISM IN A COW.

J. E. P. R., Laconia.—A cow of mine became stiff in her limbs two days after she had dropped a calf. She eats well, chews her cud, and gives the usual amount of milk. I think she took cold, and if cattle have rheumatism, I believe that is what ails her. Is it?

ANSWERED BY DR. F. L. KILBORNE.

The case is very likely one of rheumatism, which is not uncommon in the cow. If there is swelling or stiffness of the joints especially, or other fibrous structures, with a tendency to shift from place to place, or if the stiffness is aggravated by cold, dampness, or exposure to wet, the trouble is probably due to an attack of rheumatism. For treatment give a dose of purgative medicine to unload the bowels. One pound of Epsom salts, one-half pound of common salt and one ounce of ginger, for an average cow, the whole dissolved in a quart or two of water and given as a drench. If the cow is small or under three years of age, reduce the dose one-third. Then three or four times daily give two-dram doses of salicylate of soda for several days, or until the stiffness disappears. Rub the limbs once daily with the following liniment: Olive oil one pint, strong aqua ammonia one-half pint, camphor gum two ounces, spirit one pint. First dissolve the camphor in the spirit, the oil with the ammonia, then mix. Shake well before using.

"NO PLACE LIKE HOME."

H. C., Lemars, Ia.—In the RURAL of June 8, Professor Sheldon tells us of the very deplorable condition of English farmers. If the case is so bad, why do English farmers, as a class, *not* come here? It is sufficiently well known that few have done so. I began asking this question several years ago: I am asking it still.

ANS.—It is doubtful if the question ever will be answered entirely satisfactorily. It is a part of human nature to think that our neighbor is better off than we are. There are doubtless men in all parts of the world who grumble at their surroundings, and see "better times" in every other land than in their own. Yet they rarely move away to experience the better times. "There's no place like home." That accounts for a good many instances where men stick to seemingly undesirable locations. Two classes of people are able to pull themselves away from home associations: those who are too thoughtless to really value home or are too enthusiastic to fully count the cost of removal, and those whose homes have been made unbearable by some mighty despair or some terrible sorrow.

GIRDLING GRAPES.

G. E. H., Ulster Park, N. Y.—1. At what stage in the growth of grapes should the vine be girdled to hasten the ripening of the fruit? 2. Is there a special tool for the purpose; if so, where can it be bought? 3. Does girdling injure the flavor of the fruit?

ANS.—1. As soon as the fruit is so far developed that satisfactory selection of canes to be operated on can be made, which will be soon after the berries swell. If deferred till later, the effectiveness of the process will merely be more or less diminished. 2. We know of no tool especially intended for this purpose. None is, in fact, needed—beyond a sharp budding or pruning knife. Indeed the effect may be as certainly produced by winding twine or wire tightly around the cane at the proper place for ringing. 3. The effect is to considerably enlarge the fruits upon the girdled cane, to generally hasten the time of ripening, and to more or less injure the flavor; while the cane is nearly or quite ruined for either future growth or fruiting.

LUMP ON THE UDDER OF A HEIFER.

T. E. B., Schuylerville, N. Y.—About a week ago I noticed a lump about the size of an English walnut on the left fore-quarter of the udder of a two-year-old heifer now on grass and due to calve on July 13. The rest of the udder does not seem at all congested, and appears to be all right. What is the cause of the trouble, and what's a remedy?

ANS.—The lump is probably the result of some injury to the udder. Unless near the base of the teat, or even then, it may never interfere with the flow of milk, in which case no treatment is necessary. When the heifer comes fresh, if the lump is found to obstruct the flow of milk from that quarter, you should employ a skilled veterinary surgeon to open the passage. Painting now once daily with compound tincture of iodine might reduce the size of the lump.

Miscellaneous.

Mc. A. K., Winchester, Va.—Is the Cinnamon Vine the same as the Chinese Yam, and does it ever bloom?

ANS.—Yes, it is the same. The vines bloom very freely and the yams are hardy. The bloom is not showy, but the odor is that of cinnamon as nearly as it can be described.

W. J. M., Canaseraga, N. Y.—A tumor now as large as a hen's egg, has been growing on the stifle joint of my mare for four or six years; what will remove it?

ANS.—Apply an active blister, and repeat once or twice if necessary. A competent veterinary surgeon might be able to safely cut it out.

C. W., Waukegan, Ill.—1. Mr. Childs's catalogue highly recommends the Tree blackberry; what does the RURAL think of it? 2 Is the Black-bearded Centennial wheat likely to be hardy here?

ANS.—1. As soon as announced, we wrote to John Lewis Childs for several plants of the Tree blackberry, but they were not sent. At any rate they were never received. We don't believe in it. 2. The Black-bearded Centennial is tender at the Rural Grounds and probably will so prove with you.

J. H. B., Lansing, Mich.—1. What is the clover a sample of which is inclosed? 2. What is the best tame grass for a piece of marshland which appears to be getting too dry for wild grass?

ANS.—1. The small yellow-flowering specimen is Trifolium procumbens—Yellow clover or Low Hop clover. The pinkish-flowering one is Trifolium reflexum—Buffalo clover, valuable for pasture, as cattle are fond of it. We do not known why it could not be cultivated profitably in some portions of the country where Red clover may fail. Trifolium procumbens is thought to be of little value, being an annual and not growing tall enough. 2. Red-top is the best grass we know of for moist situations.

DISCUSSION.

"TRAIN UP A CHILD."

"A SON."—An article from "A Reader," in the RURAL some weeks since, giving his experience as a boy with regard to his father and farm life, leads me to say that there are other and brighter pictures of farm life which we may do well to contrast with his dark side of farming. I was born and reared upon a farm. My father was not rich, neither was he poor. He made me to feel, as long as I can remember, that I had the same right to opinions as he, and though I was often wrong, he never made my mistakes the subject of ridicule, but often brought out the results as valuable lessons by which I now often profit. I do not recollect that he ever gave me any certain piece of property to do with as I saw fit, but he made me interested in the whole, by saying "we" and "ours," instead of "me" and "mine," and not restricting me with regard to my personal expenditures. When I arrived at a suitable age to go into society, he said to me at one time: "I am pleased to see you go and enjoy your life while you are young; but be cautious with regard to the companions with whom you associate, as they will have a strong influence on your after life." I always had free permission to invite my friends to our house, whenever I wished, and I preferred doing so to going from home for the purpose of having their company.

With regard to money matters, he advised me faithfully, and instructed me carefully. One piece of advice which I shall always recollect was something like this: "Remember that we are not rich; that we have nothing to squander on drink, or burn up in smoke; but also remember that we only go this road once, so do not be niggardly and deprive yourself of the good things of life that are really good, whether they are to benefit, instruct or please." He never gave me but one dollar that I recollect, but frequently he told me to go to his pocket and get what I thought "we" could afford to use. And I assure you I never misused the privilege. When I was about 16 he told me I had better begin keeping the farm books, and about three years afterwards I began looking to all the farm business, always asking his advice, and being governed by it.

On my part, I never deceived my father intentionally, and, although I often made mistakes, he was always patient with me, and when he asked me with regard to anything, either my mistakes in business or the follies and mistakes of boyhood I always told him just as it was, and what was best, and did me most good, was that father believed just exactly what I told him, and I do not think he ever asked any one, to verify my report.

Now the result of all this early training is that I am a farmer. I could not be anything else. My father's farm and mine join each other, and I manage both. He is now a venerable old man, and I am near middle age, but still we are all to each other that we ever were. He trusts me implicitly, and I love him sincerely. There is scarcely a day in which he does not come to my house. He sometimes asks what is the order of the day, and often gives me good advice for he is able, and when well enough often lends a helping hand about some light work.

Do you wonder that I am a farmer; that I love the dear old home where I have been so kindly cared for; and that I love the good, kind old man, who has many times denied himself for my sake? And if more parents would pursue a like course with their sons, respect their ideas, and encourage them to think and act for themselves, and that instead of being mere machines for earning and accumulating the almighty dollar, they are reasoning, intelligent human beings, on whom the welfare of the nation depends, we would soon have a nation of able, energetic and progressive farmers, who would make farming pay.

SHOULD IMPORTED TROPICAL FRUIT BE TAXED.

J. H. G., QUEENS COUNTY, N. Y.—A late RURAL mentions the fact that some fruit-men feel that the sale of tropical fruits hurts the trade in home products.

We have a good deal of complaint among farmers because of the low price of their fruit products. Apples have scarcely brought enough to pay the farmer for picking and packing; strawberries are sold at ruinous prices and there is every prospect of a still poorer market for other small fruits. One of the reasons for these ruinous prices is the plentifulness and low prices of tropical fruits. With bananas retailing at 10 cents per dozen and fine pine-apples at 10 cents apiece, it is not strange that people do not buy apples or small fruits. It is the custom of the manufacturers to demand protection as soon as a foreign product comes into competition with the home product. Now, it is evident that the products due to the sunny skies, fertile soil and cheap labor of the tropics are coming into direct competition with those produced by the labor of the American farmer.

Why not, therefore, put a tariff on bananas and pine-apples and other fruits, which shall prevent their importation to any great extent? There is now an insignificant duty on oranges, but bananas and pine-apples are free. If a duty be put on these and other foreign fruits, sufficient to prevent their importation, the price of apples, pears and small fruits will be doubled in a year. In the year 1888, $3,482,846 worth of bananas were imported. Suppose all, or nearly all, of this vast sum had been spent for apples and pears, would the market have been glutted and prices ruinously low? If the policy of protection is to prevail, let it apply to farming as well as to other industries.

PYRETHRUM AND POWDER GUNS.

J. R. H., MOUNTAINVILLE, N. Y.—The air gun I use for the destruction of insects with pyrethrum, is simple and inexpensive, costing only 25 cents. It is of cylindrical shape, slightly conical, made with small circular pieces for top and bottom, with a spiral spring between them. It is about four inches long, covered with thin leather, and holds about one-half pint. By placing two fingers on the top, and the thumb at the bottom, the little gun is closed together and the dust is thrown in a cloud through the foliage with two or three pressures. I think such guns can be found at any of the New York drug-stores. As to how often, and the best time to use the pyrethrum, it should be used every day, at noon, especially if the weather is dry and hot, as at that time all the insects are actively at work, and can be found, but in a humid atmosphere the powder appears to be much more fatal; for instance, when there is dew or on a damp day. When the atmosphere is in this condition the powder is fatal to the asparagus beetle and its larvæ. The question: "How does pyrethrum kill the insects?" would bring forth some very interesting information. The theory presented to my mind is that it poisons the lungs, as it acts upon the pests in a few seconds after the cloud has enveloped them, apparently before they have had any time to eat any of it, and they really pay little attention to it until they commence to rub themselves with their feet. A prominent physician has informed me that an insect has no lungs. He said that insects breathe through tubular passages and these passages were stopped up by the powder; but if this be the case, why should not other fine powders answer the same purpose?

HIS FAVORITE CHURN.

P. C., MILFORD, N. H.—In a late RURAL I saw the criticism on the New Hampshire Experiment Station director in regard to the trial of dairy apparatus. Now, I do not think the director said that the Stoddard was the best churn; but he does say that there is practically no difference in the efficiency of the three churns mentioned and if there is any preference it must come from convenience in handling and ease of operation. On this point there is no doubt in the mind of those who have actually operated the churns here at the Station. For ease of handling and cleaning and for perfection in the granulation of butter, the Stoddard churn stands at the head. The Blanchard is open to the objection that it has inside floats which seriously interfere with the granulation of butter. The Davis is harder to operate and is more difficult to clean. I see no need to criticise the director for telling the farmers what they ought to know. Eight years ago we wanted a new churn. There were in my neighborhood two Stoddard and one Blanchard. Each owner thought his churn the best. I went and

saw them in use, and I cannot see how granulated butter can be made with a Blanchard churn; but the granulation was perfect with the Stoddard. I told the man who had the Blanchard churn that I did not want one, and I never have changed my mind. I bought a Stoddard for making granulated butter: it is good enough for me and it is certainly easier to clean, and any one making a trial of the two will chose the Stoddard every time if he wants granulated butter and a churn that is easy to clean.

MORE ABOUT FLEA-BEETLES.

S. F. B., PATAHA, WASHINGTON.—Here is my experience with flea-beetles. Last July they came in such swarms as to cover my garden. All the radishes, turnips, cabbages, etc. were black with them. I did not know what to do, but commenced experimenting. First, I dusted the plants with hard-wood ashes; then wet them and put on more ashes, then lime, then salt water, several kinds of insect powder, snuff and tobacco water, but all of these they seemed to like. The only remedy I found was to dust the plants with fine road dust. In that way I saved a few turnips, but perhaps the pests found something more to their liking. Yesterday I found them swarming over my mustard and turnips. Many thanks will be due to the RURAL if it succeeds in finding a remedy for this pest. This is a warm, dry month and acres upon acres of grain are burning so that farmers are turning stock upon it now. Water is getting low even in streams that have never been known to be shallow. If this weather holds a few weeks longer, many farmers will be in great need, for in this section there are hundreds who depend solely on wheat growing. This is not a fruit-growing region, but what orchards there are, are loaded with fruit of a fine quality.

ASHES AND SOOT FOR THE FLEA-BEETLE; BUSH LIMA BEANS.

H. L. N., NEWBERN, VIRGINIA.—The flea-beetles have appeared regularly on my potatoes for quite a number of years back, but never, except once, in such numbers as to threaten the destruction of the crop. On that occasion I got rid of them by the application of unleached hard-wood ashes. Two applications caused them to disappear. The beetle is the same which destroys young cabbage plants. These plants could not be grown here if they were not kept dusted with soot or ashes.

A note in the R. N.-Y., of June 8th says the new Bush Lima bean furnishes the starting point for a dwarf variety of the old Lima. The RURAL has failed to notice that a dwarf variety of the Large Lima quite different from Henderson's Dwarf Sieva, was offered this spring in the catalogue of the Northrup, Braslan & Goodwin Co., Minneapolis, Minn. The bean is claimed to be three-fifths of an inch long, one-third of an inch broad and one-sixth of an inch thick, and cream yellow in color. The pods, containing from five to seven beans, are produced in clusters.

R. N.-Y.—This is not a bush bean with us.

IN FAVOR OF AGRICULTURAL COLLEGES.

C. F. O., DARIEN, CONN.—I am glad to see so many of the R. N.-Y. readers speak a good word for the agricultural college. I am not a college-bred farmer, I am sorry to say, but I would advise all young men who contemplate following the farm for a living, to take a college course if possible. Let them learn all they can before they settle down on the farm; they will find plenty to learn afterward. While Professor Porter may be in a sense correct when he says that a college education is not *necessary* for a man to become a practical farmer, surely what is learned at the college will do no harm, and 99 times out of 100 will prove of great benefit, even if the student does not follow the farm at once for his living. While I am a young man and am learning all I can that pertains to agriculture, both from practice and from the experience of others, still there is scarcely a day that passes without my seeing that those who have had a college course, have the advantage over me in many ways. So my advice to young men is to take a college course if they can. They will *never* regret it.

ANOTHER GRADE JERSEY TEST.

E. C. G., PENN YAN, N. Y.—Here is the result of a week's test of my three-quarters Jersey two-year-old heifer.

Total weight of milk	164 pounds.
Average per day	23½ "
Total weight of cream	23 "

Total weight of butter 11 pounds, 10 ounces. Fourteen per cent. of the milk was cream. This heifer had given milk about six weeks. For four weeks preceding and during the test she had no grain of any sort, only good pasture, salt, and water, and she was confined in the barn-yard every night. The cream was churned in a Davis Swing churn at a temperature of 64 degrees for 30 minutes; the buttermilk was drawn off, and the butter washed in cold water till the water ran clear. It was then salted, one ounce to the pound, while worked in a Lilly butter-worker. Age and feed considered, who can beat this record? Let me say a word for the Davis Swing churn—ours has been in use six years and we consider it perfect in every way.

What Others Say.

POTATO SEEDLINGS.—Our friend "Joseph," in our esteemed contemporary Farm and Fireside, has the following:

"It is the simplest thing in the world to produce a lot of potato seedlings from the seed (provided you have it). The seed sprouts very readily, and makes strong plants that can be transplanted with the greatest ease. But now the trouble begins. The potato-beetle is very fond of the young and tender foliage. This pest has just ruined a patch of seedlings for me, and not a single plant escaped—all met the same fate. Fortunately, I have plenty more seedlings in the frame, and when I set them, which will be in a few days, I shall cover each with one of my unpatented plant pots, and dust them thoroughly and often with peroxide of silicate. I feel confident this treatment will insure their safety, and when the protection has to be taken away from them, the Paris-green remedy, I think, will keep them from very serious harm."

The R. N.-Y. was the first of the rural papers to raise potatoes from seed in so far as the writer is aware. This was some 12 years ago. We have, since that time advocated seedling potato culture without much let up. Our view has been that farmers may raise seedlings that will be found to be better adapted to their farms than any of the hundreds of kinds offered for sale. Then again in the case of a lucky hit, the variety might be sold to some enterprising seedsman for a price that would well repay the producer for all his time and trouble. As "Joseph" says, the seeds will *sprout* about as readily as tomato seeds. Again, as he says, the trouble begins when the little tender plants are set out in the open ground. The beetles attack both leaf and stem and destroy them in a few days. The seedlings can *not* be saved by any application of arsenic or other poisons. The leaves and stems which the beetles or grubs will eat before they are killed will destroy the vines. Besides, they are so tender that they cannot even stand the application of plaster alone—much less of poisoned plaster. We will guarantee, friend Joseph, that you will kill every vine to which you apply peroxide of silicate. Kindly let us know the result of your trial.

The R. N.-Y. method, and it is a successful one, is to thump the plants from the little pots and set them a foot apart in rows three feet apart.

Mosquito netting, one yard wide, is then stretched lengthwise of the rows and supported above the vines by sticks placed at intervals of four feet, thus Λ, like the rafters of a double pitch roof, and the peaks are connected by horizontal sticks tied to the peaks, or where the two sticks meet, giving all needed support to the netting above, while the edges on either side are held in place below merely by covering them with an inch of soil. We have now a mosquito two-pitched covering which is quickly made and at merely the cost of the netting. This protects the vines thoroughly until they fill the triangular space when they are large and strong enough to stand poisoned plaster, and the netting may be removed to be used a second time the next season.

BRIEFS.

PROFESSOR BUDD of Ames, Iowa, deems the Downer's Prolific still the best strawberry for home use.....

A WRITER in the American Florist gives a description of a visit to the island-home of C. A. Dana. He takes occasion to speak of Mr. Dana's accomplished superintendent as follows:

"Mr. Falconer is an enthusiast, caring nothing for labor so that his eyes and heart may be gladdened by the vigor and beauty of the plants he delights in. His knowledge is gained by the most careful and thorough study. For 15 years it has been his habit to collate all the facts that can possibly be known concerning the innumerable plants of which he has had charge."

There is no other writer upon horticultural topics in general whose articles are more highly prized than those of William Falconer. Well they may be. He writes from experience gained by a thorough early education in the pursuit of his choice.....

WILLIAM FALCONER mentions, in that excellent journal the American Florist, that of his collection of lilacs he prefers Marie Legraye. Not only are the panicles of immense size, but they are produced in extravagant abundance, and the plant is a capital grower.

The new climbing Perle des Jardins, Miss Taplin says, in the same journal, is a beautiful rose that will naturally excel the old favorite, Niel, in its constant blooming.....

MISS TAPLIN also remarks, while speaking of the R. N.-Y. Rosa rugosa seedling, that there is no doubt it will be an admirable outdoor rose; its vigor, hardiness and incessant blooming are the qualities that will make it popular.....

THE reason why more men do not make dairying pay, says the Dairy World, is because they refuse to believe that there is any study or investigation needed in regard to the care, treatment and management of the dairy. If they chance on a success, they call it luck: and if they fail, they never investigate the matter to see wherein they fail, so as to steer clear of a repetition. Success in the dairy depends entirely upon the dairyman. A good dairyman, first of all, will see that he has the necessary appliances to insure success—good cows, suitable feed and buildings, and the proper utensils and knowledge for turning out a first-class product. In fact the intelligent and enterprising dairyman would be satisfied with nothing less.....

REMEMBER to try Japanese buckwheat.....

"Do all fine butter makers follow essentially the same rule?" is a question answered in the Ohio Farmer by a noted dairy authority. They do not, he says. No two exactly agree, and some show wide variance, but, after all, a similarity runs through all the different makes. Milking a good cow, generously fed, well housed and kindly treated, milk set as quickly as can be after milking, cream taken off before the milk sours, and churning at a pleasant acidity, are the rules with 99 out of every 100 fancy butter makers. They wash out the butter-milk with water. Most of them use weak brine. They use less salt, about an ounce to the pound, in the wet butter, which leaves a half ounce or less of salt to a pound of finished butter. No butter maker of great reputation holds butter for a better price, but sells as fast as made. This is now substantially the royal road of the butter makers, and he doubts if any one to-day is getting top market prices for butter made by the methods of 20 years ago.....

"THE farmer's dollar is heavy," says Emerson, in one of his admirable essays; "it is no waif to him. He knows how many strokes of his labor it represents. His bones ache with the day's work that earned it. He knows how much land it represents—how much rain, frost and sunshine. He knows that in the dollar he gives you so much discretion and patience, so much hoeing and thrashing. Try to lift his dollar, you must lift all that weight."....

WORD FOR WORD.

—PUCK:

"COUNTRY AND CITY: Miss Sheafe.—Ah, look at that wheat rising and falling yonder in the breeze! How beautiful!

Mr. Weetfit.—Ah, but you ought to see it rising and falling in the Produce Exchange!"

—PROFESSOR S. W. JOHNSON: "If you put potash or phosphoric acid on a soil of average quality, you need not fear that any surplus not consumed by the current crops will go to waste. The soil, if it be anything better than a sand pit or a gravel-bank, will retain these elements with a firm grasp. It is otherwise with lime, with sulphuric acid, and especially with nitrogen. These substances are more freely soluble in water, and are therefore liable to be carried down or away by heavy leading rains. To conserve them against loss is as important as to restore them when deficient, and amending the texture of the soil, increasing its water-storing power by suitable tillage, by incorporating with it porous vegetable matters in stable manure or buried green crops, is a necessary part of any rational system of treatment."

—ORANGE CO. FARMER: "Too many fields of buckwheat are destroyed by frosts. We think it safe to estimate that a thousand bushels are lost by early frosts for every bushel that is taken from the crop aggregate by too early planting."

—COLMAN'S RURAL WORLD: "The creamery boom has evidently struck the State of Missouri. From a number of points comes the information that contracts have been made with men in that line of business, and that thousands of dollars, generally six or seven thousand, are being put into a single plant."

—KANSAS CITY LIVE-STOCK INDICATOR: "No matter how much a farmer fancies he knows, while he breeds to a scrub or grade sire his progress will be like that of a man walking on keen ice, up hill, in comparison with that of an adept on skates."

—WESTERN RURAL: "Trusts are organized to steal other people's money. They are a conspiracy to pick people's pockets; they are operated upon the same theory that the highway-man adopts. He puts his victim in his power and commands him to deliver or be shot. He does not argue. His pistol does his talking. The trust does not argue. It comes with its sugar and demands your money, or you will drink your coffee without sugar. It comes with its twine and demands its price or you can go without twine; it comes with its oil and robs you because you must have oil. It is organized, systematic robbery, and it is done in the sacred name of law. That is the most galling part of it. A government of the people, by the people and for the people permits a few conscienceless plunderers to rob the millions, without so much as a remonstrance. A discussion has just been settled by a Chicago court that the gas trust is practically legal. It sometimes seems as if government was expressly organized for the protection and encouragement of the well dressed villains of society.

—LIFE: "WHILE Europe is industriously engaged in shipping her paupers and convicts to the United States, the United States is just as busy shipping her millionaires and their families to Europe. It doesn't take a political economist to determine in whose favor is the balance of trade."

—INSECT LIFE: "We learn from the California Florist and Garden for March, 1889, that during the year 1888 there were imported into the United States from Dalmatia and other places between 200 and 300 tons of dry pyrethrum flowers, while California's product was 52 tons."

Horsford's Acid Phosphate.

If you are Nervous,
and cannot sleep, try it.—*Adv.*

Miscellaneous Advertising.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

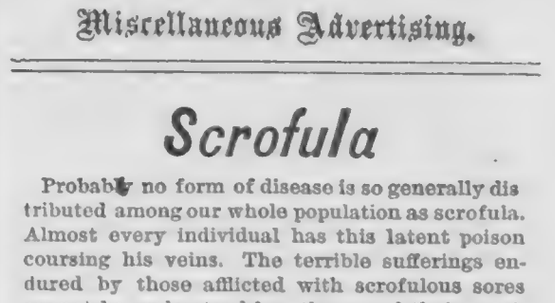
100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lame-back, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

Beecham's Pills act like magic on a weak stomach.



THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JULY 6, 1889.

IT may be worth noting that the vines of the potatoes growing in the barrels have not been attacked by potato beetles and by comparatively few flea beetles.

THE dressed beef men have always argued that their meat is carefully selected, cleanly handled and packed. They should ride a few miles out of New York to some of the smaller suburban towns and see how they like the way our meat comes to us. It is taken off the ice in this city, put in ordinary, open baggage cars, dumped off the cars to the station platforms, where it stands in the broiling sun until the local butcher can put it into his ice box. Now this meat costs us just as much as did that of several years ago, when butchers killed and dressed their own beeves—many of which were raised right on our own farms.

WHAT is to be done with the thousands of lazy, shiftless young men one notices in all our large cities? They are absolutely opposed to all useful labor. It is useless to find them opportunities for earning money—they will not stay in any place, however favorable, more than a few days. They are simply worthless scamps who are perfectly willing to eat and drink up the hard earned savings of mothers and sisters, or to depend upon theft and fraud for their livelihood. This worthless, idle class is constantly increasing in numbers. The problem of providing for it will become one of the most important that Americans will be called upon to settle. There is absolutely no place in this country for a class of vicious non-producers. The idle rich, who do nothing but spend money are bad enough; but the healthy poor who will not work and who do their best to discourage work in others, are entirely out of place in America.

"Do you wonder that I am a farmer; that I love the dear old home where I have been so kindly cared for? Read "Train up a Child," under Discussion, page 446.

A FRIEND in New York State is engaged in the business of supplying hay for the horses in this city. In speaking of his methods of curing and handling hay, he says: "Clover is the worst weed the dealer has to contend with."

Another friend in the same State supplies milk for the city market. He writes that he has about decided to so rearrange his rotation that he will raise no Timothy, as he believes that clover will pay him better—make more milk. Thus with one clover is a worthless weed, while with the other it is the most valuable plant on the farm. Both of these men are successful farmers. One takes pride in sending to the city the best possible quality of hay; while the other is anxious to produce the largest possible number of cans of milk per acre. The point we want to bring out is that the time has gone by when general rules of agriculture will answer for those who perform special work. Nature has provided a special tool for each department of farm economy. She does not put these tools into the farmer's hand without a request from him. She puts the whole list within his reach. He is to hunt out the one best suited to his special work.

THE GRAIN APHIS.

THE farmers of Ohio, Indiana and Southern Michigan are much alarmed by the presence on the wheat of Aphis avenæ, or the grain plant louse. In Indiana they call this the grain midge. This is a very wrong term. The midge is a two winged fly, much like the Hessian fly. The orange fly lays its eggs on the berries, and the orange maggot absorbs the juice from the berry and so causes it to wither. This plant louse is very different. It works on all kinds of grain—oats, barley, rye, etc. It also inserts its beak and sucks from all parts of the plants—stem, leaves and head. This grain Aphis is no new pest. It has often done serious damage, and was fully described by Dr. Asa Fitch as early as 1865. The one comforting thing about it is, that it is rarely very destructive two years in succession. As is well known, dry weather is very favorable to the development and increase of plant lice. It is very probable that the very dry weather in April and May explains the raid made by the pests the present season. It is equally true that wet weather is unfavorable, and destroys the lice. It is to be hoped that the present numerous and copious rains of June have been in time to kill the lice and save the crop.

From the nature of the case, the excellent plant-louse specific, the kerosene and soap mixture, can hardly be employed in combatting the grain aphis. We can only hope that the rains will bring relief, and rejoice that we shall probably be exempt from the scourge another year

ANTI-TRUST LEGISLATION.

WHO was it that predicted that in 15 years the business of this great country would be consolidated in a few trusts, and that the social system would then consist of a few families of enormous wealth, a middle class of lackeys, and a great laboring class of degraded working people? Is there any serious likelihood of such a revolution in 15 or twice 15 years? It is an obvious fact that in spite of public sentiment and much legislation, trusts are multiplying alarmingly and enlarging their scope and influence, and all legislation hitherto formulated against them appears ineffective. Indeed, all the acts hitherto passed seem defective in some respects. The Kansas law, for example, prohibits combinations tending to "advance, reduce or control" price or cost to producer or consumer. The Texas law is drawn with equal looseness, and that of Iowa is by no means well formulated, while the Missouri enactment, although better in form, does not appear to possess any terror for trust-makers, the National Lead Trust having recently made fresh headway in St. Louis, and a plug tobacco trust being now in process of formation there. Is it possible that the trust magnates hire shrewd lawyers so to formulate anti-trust legislation that it must prove inoperative? The tersest, clearest and most coherent bill of the kind yet formulated is that just passed by the Michigan Senate, and which is pretty certain to pass the House also. It was framed by Judge Christiancy, and is a model for such legislation. What is the use of anti-trust laws if the smart lawyers whom the trusts' immense resources are prompt to hire, can "drive a coach and six" through them?

MR. HALE'S PEACH CULTURE.

THE R. N.-Y. congratulates you, Mr. Hale, that in opposition to the advice of experienced friends, you should have engaged in peach culture, and that the present season, in spite of untoward conditions, the prospect of a profitable crop was never better. The frosts which injured the crop in many States and destroyed it in others, merely served in Mr. Hale's orchard to effect a judicious thinning out of the fruit, and he now has well-grounded hopes that his peaches will be as large, as highly colored and as abundant as those of any other peach orchard of similar size in the entire country. Mr. Hale has made departures in his peach culture from the usual methods, which are both original and instructive. He spreads upon the orchard 400 pounds of muriate of potash every year. He uses the muriate simply because it is the cheapest form of potash. This, as he believes, induces a fine color in the fruit. Besides the potash, he uses 1,000 pounds of fine raw bone per acre. This gives the phosphoric acid and all the nitrogen, which the trees seem to require. His trees are not troubled with the yellows but are thrifty and sound. He leaves the peaches on the trees until they are *ripe*. Then careful selections are made in harvesting and each basket is *guaranteed* to be filled with fruit of the same quality from the bottom to the top.

His varieties are the Mountain Rose which ripens from August 25th to September 10th; Oldmixon, ripening from the 10th to the 20th of September; Stump the World, ripening from the 15th to the 25th, ending with some Late Crawford, Ward's Late and Morris White. Go, you, good peach-growers, and do likewise. Mr. Hale's farm is in South Glastonbury, Conn.

PROHIBITION.

SO far this year four States have voted on the question of constitutional Prohibition, and in all the amendments were defeated by majorities so large as to leave no doubt of the wishes of the majority of the people. In New Hampshire the adverse majority was 5,503; in Massachusetts it was 45,820; in Pennsylvania 185,000 and in Rhode Island 18,000. Judging from legislation on this subject of late, it is evident that the prohibition sentiment in the country is stronger in the West than in the East. This, no doubt, is due to the fact that there are fewer large cities and towns in the former than in the latter. As an almost invariable rule, the States in which large numbers of workingmen are centralized in cities are opposed to Prohibition. The very class that would be most benefited by the abolition of the liquor traffic are most bitterly opposed to it, and the cities where laboring men congregate in greatest number roll up the heaviest majorities in favor of the saloon. It is a trifle curious that while Republicans make special claims as antagonists of the whiskey power, the above four States are strongly Republican in national politics. Local option or high license is the form in which Republican advocacy of temperance generally finds expression. Laws in support of the former enable any county in which the general sentiment is in favor of Prohibition, to enforce it; laws in support of the latter increase the revenues of the various municipalities, diminish the number of saloons, and weed out the more disreputable among them: but there is absolutely no proof that the decrease in the multitude of these plague spots causes any diminution whatever in the consumption of intoxicants, and this is the main point in the whole temperance agitation. What difference is there in the effect of the sale of liquor whether a dozen men become intoxicated in a dozen different rum mills, or whether they all become drunk in one? Politicians and liquor men are generally jubilant at the idea that the late defeats have given Prohibition a death-blow. The idea is ridiculous. The party engaged in the Prohibitory movement may have to reform its party lines, and drop some of the issues that have weighed heavily upon it; but there is too much vitality in it, and too much importance in the issue for which it is contending, to permit it to surrender because of these setbacks. What great reformation was ever effected without overcoming some temporary checks?

HOW ABOUT IT?

AFTER a long and earnest battle with politicians, Prof. J. W. Sanborn has been removed from his position as Dean of the Missouri Agricultural College and Director of the Missouri Experiment Station. The R. N.-Y. has obtained a history of this contest, and it is a history that ought to make the farmers of Missouri blush with shame and indignation. The R. N.-Y. believes Prof. Sanborn to be one of the ablest agricultural teachers in the United States. It is also satisfied that he is an honest, faithful, fearless, energetic and competent official. So far as we know, nobody has ever disputed these facts—not even those who secured his removal. In reality, he was too honest, too faithful, too fearless of the gang of political boodlers who have no use for the University of Missouri except as a part of their political machine. They were unhappy because they could not control the little "patronage" that fell in the way of the agricultural college. Whenever they undertook to make this college a part of their political machine, they found Prof. Sanborn squarely and unflinchingly in their path. Unable to get rid of this opposition in any other way, the politicians artfully engineered a political crusade against what they termed "the management of a Yankee and a Republican." As a result of this movement the legislature refused to make any appropriation for the university until Prof. Sanborn was removed. Then the professor's friends weakened, the appropriation was voted and Sanborn was removed.

This contest should not be permitted to drop. Prof. Sanborn distinctly states that the university authorities have for years misappropriated the funds belonging to the agricultural college. The R. N.-Y. believes, from the information it has at hand, that these charges can be substantiated. When the Hatch Bill was passed, the R. N. Y. stated that it would give its earnest support to the stations and colleges just as long as they showed evidences of a desire to do honest work. It also stated that it would do all in its power to correct abuses and punish mismanagement. The time has now come to determine whether politicians and boodlers are to run these stations or whether farmers and their representatives are to manage their own affairs. Now, Secretary Rusk, and Assistant Secretary Willets, what do you propose to do about this matter? The R. N.-Y. demands an investigation of the conduct of the directors of the Missouri Station. Prof. Sanborn makes definite charges. Are you going to ignore them? The public want to know about these matters. If you do not stamp all political jobbery out of the work of these stations you will lose the influence and respect of the class of farmers you need to help you in your work. The Hatch Bill provides a remedy and a punishment for misappropriation of the experiment station fund—doesn't it? Investigate the Missouri Station, and if the facts warrant it, apply that remedy sternly and quickly. This is an important matter. Let us carry it right through to the end.

"They think they know all about farming and hence don't want to learn. . . . . It is a long and difficult task to lift farming from an illiberal labor to a liberal profession; to make it an applied science, a skilled art instead of an empirical drudgery. It will be long before the bulk of farmers 'manure with brains.'"—PRES. CHAMBERLAIN, page 444.

BREVITIES.

How is your potato contest plot, good lady?

GOOSEBERRIES.—Millions of them! We have never before seen so large a crop as that which is now maturing at the Rural Grounds.

A CANADIAN subscriber says that the flee-beetle troubles him only in small patches of potatoes. In the large fields it does comparatively little harm.

THE Parker Earle strawberry will come to stay—if its behavior at the Rural Ground *this* season may be taken as a guide for other parts of the country.

THE FLEA-beetles have nearly disappeared and the R.N.-Y.'s hopes are proportionately strengthened that its Contest Plot will this season meet with success.

SPRAY asparagus plants, infested with the asparagus beetle, with Paris-green or London-purple water. Use a heaping tea-spoonful of the first and two of the latter to two gallons of water.

THE R. N.-Y. has sprayed grape-vines with the Bordeaux Mixture with a view of repelling the rose-bugs, as suggested by Col. Pearson. But the sprayed vines were infested the same as those not sprayed.

AN abundant hay crop seems assured. All that is needed is curing weather. Stocks of Western hay on hand from last season are large and the South is increasing its hay product. Prospects are not very bright therefore for high prices.

A brother of the great horse Spokane, the Montana phenomenon of the race-course, the cynosure of yelling thousands, petted, caressed and belauded, toils in front of a street-car in St. Louis. Will the present favorite's career end in the same monotonous drudgery?

AN effort will be made at the Paris Exposition to enlighten the French people as to the great merits of the American cranberry. There is a future for this fruit. Its consumption is largely on the increase and there is every possibility that a good export trade can be built up and maintained.

WHEN it is desired to catch the horse at the R. N.-Y. farm it is only necessary to go to the fence with a pail containing a little skim-milk. The horse will come on the trot the moment she sees the pail. We have lived on farms where it was necessary to spend an hour or more chasing the horse at pasture.

SECRETARY BLAINE tells the Chicago Board of Trade that he is about to take "decided action" with regard to the French and German prohibition of American pork importation. Good for Blaine! His "vigorous foreign policy" has done well for the maltreated Oceanic Samoans; why shouldn't it be exercised with equal force and success in favor of the calumniated American Hog?

THE R. N.-Y. has frequently noticed how much of the pea crop is wasted by market gardeners. The vines are permitted to become hard and woody before being harvested. The peas are picked and then the vines stand in the sun or wet until the ground is wanted for another crop. These pea vines make an ideal crop for the silo. The stalks of sweet corn form another admirable silo crop. The time may come when the silo will enable gardeners to compete with the Dressed Meat Trust.

THE R. N.-Y. makes its so-called Bordeaux Mixture by the following simple formula: Half a pound of copper-sulphate; dissolve this in hot water. Half a pound of unslaked lime; slake this and add enough water to make two gallons (one pailful) in all. If this is to be forced through any of the spraying nozzles, it will be economy to run it through a fine sieve before spraying. The original Bordeaux Mixture can not be forced through a nozzle. Besides, it is so strong that it will seriously injure the foliage of potatoes and roses, and must, therefore, do some harm to grape-vines.

Farm Economy.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

FIRE-FANG.—Is fanged dung "as worthless as straw?" The chemists don't say so, nor do the crops. Analysis shows that this overheated manure is worth more, pound for pound, than it was before it fanged. The loss to the owner is in the fact that there is a great deal less of it. As the loss in value is less than the loss in weight, a ton of fanged manure has more money and manurial value than a ton of the same before fanging.

WORTH KNOWING.—A knowledge of this fact has enabled me to make a little profit, though at the expense of reputation as a farmer. I buy a good deal of dung, and always pay the same price per load for the fanged as for the unburned. I have been too long accustomed to have the know-it-alls laugh at me, to be much disturbed. We all know what Solomon thought of this kind of laughter.

"A LITTLE LEARNING, ETC."—When a pile of dung heats strongly, it loses weight; and very fermentible manure will heat sufficiently to lose more than half its weight. What is it that has left the pile? Nearly all of it is water; but if there is any ammonia, gas or carbonate in the manure, some of this will go off with the water vapor. A very little ammonia makes a very big smell; and the loss of this is much smaller than we are apt to think. I cannot just now put my hand on the record of any analyses of fanged dung, but I have seen them, and while they show a proportional excess of potash and phosphoric acid, there was still a fair amount of nitrogen compounds left in it.

WHAT GOES ON?—What changes take place in the manure under this treatment? First, concentration by evaporation. A large percentage of the moisture, practically all water, goes up by ventilation. Where the manure is or becomes dry enough to need irrigation from the urine tank, much of the water from this is also evaporated. Altogether, this evaporative process greatly reduces bulk and weight, while preserving all the manurial value. Second, a de-and re-composition goes on, which gives us the plant food in a more available, and therefore more valuable form, at the same time improving its physical properties—making it fine and even in looks and quality, and so capable of producing evenness in the crops, and in the future condition of the soil to which it is applied.

WHERE MUCH SOFT FEED IS USED, a considerable amount of dry bedding may be necessary in order to have the manure firm enough to keep swine on it. Covered drains in the cement floor might help the situation in some cases, but few farms are unable to provide or obtain enough dry material of some sort for this use. Dry muck (air-dried for a year under sheds) or dry sawdust, spent tan, and many other cheap absorbents can be used. I believe the wisest course is to use most of our composted manure for growing grass, either as top-dressing or in seeding; and to grow our hoed crops on turned sod, or on fallow with bone fertilizers, wood-ashes, potash salts, and the like. With good management, no manurial nitrogen need be bought on stock and dairy farms.

MODERATE THE HEAT.—How shall we do it? In several ways. Perhaps the easiest and cheapest way is to keep hogs on it. Many object to keeping swine in a manure shed, pit, or cellar, as being injurious to the health of the animals, and to the wholesomeness of the meat. If it injures the health, then there is no boubt about the injury to the meat. But there is no better, more salubrious or more comfortable spot to winter swine than in a well-lighted, well ventilated and properly managed place where manure is being rightly managed. The only vapor that comes up from such manure is the vapor of water, slightly impregnated with some harmless volatile matter. Doubtless such places can be badly mismanaged; but as long as the manure is kept safe from injury, the hogs will be all right.

NO EXCESS OF WATER.—This is a main point. If all the urine goes down or out with the manure, you will have a slush-hole sure enough, in which the pigs must wade, or swim. A urine tank is indispensable, with a pump and leaders provided to irrigate the mass as needed. And there should also be a place where the swine can be penned. In this place they should have their cleanly strawed beds.

COMPOSTING MANURE.—When manure is mixed with bedding material and other rough vegetable waste, the question arises, how shall we fit it for use? In the first place, I would never allow any long corn stalks or like fodder among my manure. Such stuff should always be cut before it is fed. Then how much composting will pay? That must depend upon how good your arrangements are. But if it pays to allow about double price for increased solubility in commercial fertilizers, it certainly ought to pay for some labor spent to have the availability and mechanical condition of stable manure so greatly bettered as it can be by judicious composting.

COMPOSTING WITHOUT FANG.—This is entirely controllable, several methods being applicable. Sufficient compression prevents it entirely, as we see in sheep pens and box stalls. But if air is entirely excluded, the manure is not much improved. The presence of a certain amount of air, which is excluded by a preservative compression, is necessary for the progress of that decomposition which increases solubility. We want the manure to heat, but we must be able to control the heating process.

MOLD IS NOT FANG.—Sometimes people standing by when we are drawing out manure, seeing the matured article sometimes appearing a little moldy, insist that it is fanged. No such thing. Mold is a plant. Injuriously heated (fanged) manure is never moldy. Its light, whitish appearance, to which mold has some resemblance, misleads the observer. The heat produced in fanged dung destroys all mold germs. They may re-appear in *old* fanged manure, but when fresh there is no mold on it.

NITROGEN IN DUNG.—In dung as voided there are practically no volatile nitrogen compounds. These are produced in the progress of de- and re-composition, which goes on in the heap according to its conditions and circumstances.

HANDLING AND SAVING MANURE.—Mr. Saunders, of Ohio, (p. 396,) advocates keeping manure in ridges not over four feet high, exposed to the weather, and says he has very little fire-fang. He is opposed to keeping it under cover. I keep all my manure in sheds, mixing all sorts together, and find no difficulty in preventing loss from heating. I desire to have it heat, but I do not allow it to fang.

HANDLING MANURE.—Manure is costly to handle, and I do not wonder that thinking farmers strive to avoid handling it more than they are obliged to. Manure never gains in potential value by keeping. In this sense, it is never worth more at any time than when it is dropped. Clear horse, sheep, hog and hen manure is fit for application to crops when dropped; and the plan of Mr. Macpherson, of Lancaster, Ontario, by which the dung of his cow stables (the fluid being piped to a reservoir,) is dropped through scuttles to dumping platforms in the basement, is an excellent one for a dairy farm.

Pomological.

THREE RUSSIAN PLUMS.

PROF. J. L. BUDD.

Mistakes made in the early distribution of three varieties; their advantages over other kinds; habits of growth as well as size and quality of fruit of the Black Prune, White Nicholas and Early Red; their hardiness and freedom from injuries from insects.

AT the Chicago Convention of Nurserymen I stated, in answer to queries, that the Early Red plum from Russia was proving one of our best plums for sections where the West European varieties and their seedlings measurably failed on account of winter injury to the trees, the rotting of the fruit, or loss from the attacks of the curculio or plum gouger. This public remark has brought several letters of inquiry, mainly from parties east of the lakes. I answer in the RURAL, as we have made blundering work in the distribution of three of our Russian varieties.

We received them from Dr. Regel, in 1880, under their Russian names, which we could not then read. At first they were propagated and sent out for trial as "Russ. No 1"—now called Black Prune; "Russ. No. 2"—now called White Nicholas; and "Russ. No. 3"—now called Early Red. Later, by accident, cions used in top-working were mixed. This gave us a lot of mixed cions we could not then separate. Some of these we sent out under the name of "Mixed Arab," as the Black Prune is grown in Russia in the interior as Black Arab. We said at the time that we could not afford to lose the mixed cions and that when they reached the bearing stage the red, white and black fruits would tell their own story as to proper names. All of these varieties are proving hardy in tree, perfect in leaf, and excellent in the quality of fruit.

THE BLACK PRUNE (No.1) is spreading in habit of tree with quite large, broad, light-green leaves without luster. The fruit is prune-shaped, about as large and as good in quality as the medium German prune, and is nearly free from the attacks of the curculio and plum gouger, so far as noted. In tree and fruit bud it appears to be quite as hardy as any of our native Western plums.

THE WHITE NICHOLAS (No. 2) is upright in habit and only develops the terminal buds on the preceding year's wood, giving it a peculiar expression, as the leaves are mainly at the points of growth, and on the numerous fruit spurs. The leaves are small and much like those of the Early Red except in their greater width. The fruits are also, in size and shape, much like those of the Early Red, but yellowish-white in color. So far they seem curculio-proof.

THE EARLY RED (No. 3) has been most widely distributed, as by top-working we soonest learned its value. In tree it is much like the White Nicholas, but the habit of having its leaves at the points of growth, with rosettes on the fruit spurs is still more observable. The fruit—in pairs—is found on the spurs of the two-year-old and older wood, and makes peculiarly rapid growth during the early period of development. At this time (June 15) the fruit is fully four times as large as that of our largest and earliest native sorts. Perhaps this early rapidity of development, and the accompanying supply of water in the cell structure, may give warning to the curculio and gouger that it is not a proper place for egg deposits. Be this as it may, I have not as yet seen a single mark left on a specimen of this plum by insects. When fully mature the fruit is oval in shape, deeply sutured, purplish red in color, and about like the Richland in size and quality. While it is likely to prove valuable in parts where the Lombard is perfect in tree but liable to injury from rot or curculio, it will have its greatest value in parts where such sorts as Moore's Arctic are killed to the ground, as they are with us.

Agricultural College, Ames, Iowa.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

IT is a fact that every woman is inclined to have what we call a "good cry" every now and then. It settles the nerves and relieves the feelings, but it is a bad practice to indulge in too often. One is apt to become chronically lachrymose, to the great detriment of both health and spirits. Life is too short to be spent in mourning All the same, if you *must* cry, do it without bitterness, and get over it as quickly as possible.

* * *

LAST year we spoke of domestic picnics—not big, formal affairs, where every one puts on her best gown and her company manner, but just a quiet, restful day in the woods, with a lunch thrown in. It is a capital rest for a busy woman, if she will only make up her mind to enjoy it. Just take the children and determine that no outside cares shall interrupt the pleasure. Out-door life is one of the best things in the world to give health and good temper; pity that housekeepers are apt to get too little of it.

* * *

How much time do you give to essentials—how much to unnecessary trifles? We recollect some old rhyme—maybe we do not quote it correctly, but it was something like this:

"There's too much labor goes to a bonnet,
There's too much stitching goes to a shirt;
Nothing is worth all the work we put on it—
There's nothing that's constant but labor
and dirt."

We don't take quite such a discouraging view of things, but certainly people do a good deal more than they need. In our house keeping, we should put cleanliness first, and insist upon it, too; but once satisfied that the place was clean and tidy, we should not care whether we gave our guest as many different kinds of cake as our neighbor or not, nor do we believe that many men would wish to see their wives overworked and miserable just for the sake of always providing an elaborate meal. Be moderate in all things, extra work among the rest.

* * *

DURING the summer there are many calls for simple medical aid, and it is well for the mother to be prepared in this direction. Ammonia for insect bites, alcohol for eruptions caused by poison, and simple medicines for disorders of the stomach, are most often needed. Such a reliable medicine as what is called by druggists the "Sun Cholera Mixture" will often prevent serious illness when rightly administered. The dangers of drinking too freely of cold water, or eating unripe fruit, should be impressed upon the children; teach them something about the care of their own little bodies, and the mother's responsibility is somewhat lightened.

* * *

ALL sorts of puffed or fancy sleeves are in vogue, but the most fashionable seems a modification of the old leg-of-mutton, with most of the fullness pushed up to the top. Often the fullness is wrinkled crosswise, like a mousquetaire glove. By the way, the mousquetaire glove is in great favor again, being worn entirely for dressy occasions; it harmonizes with these Directoire styles. Certainly, the fashions never were prettier than now, and they have the added charm of convenience and good sense.

OUTINGS IN NEW ENGLAND.

XI.

MARY WAGER-FISHER.

IF we had not previously decided upon Marblehead Neck as our terminal point, it would have been difficult to decide what place to choose on the long stretch of North Shore that lies between Boston and Halifax. All along that deeply indented, rock-bound coast, cottages and villages are strung like beads on a rosary—every place has its own peculiar charm. Marblehead is about 20 miles from Boston and can be reached by steam or horse-cars. Boston millionaires have their steam yachts and use them as vehicles of transportation. The railroads pass through Lynn and Swampscott, with Nahant lying on the end of a stretch of sand out at sea;—then come specified beaches and bluffs, Clifton, Devereaux, Marblehead, Salem, Beverly Farms, etc. Longfellow used to spend much summer time at Nahant where the sound of the Bells of Lynn was borne across the water to his ears. At Devereaux is the fine old mansion, used as a boarding house, where "we" sat within the farm-house old,

Whose windows looking o'er the bay,
Gave to the sea breeze damp and cold
An easy entrance night and day.

the first stanza of "The Fire of Driftwood"—and the next descriptive of Marblehead:

"Not far away we saw the port,
The strange, old-fashioned silent town,
The light house, the dismantled fort,
The wooden houses, quaint and brown."

The masses of rocks on which Marblehead is built are Syenite and porphyry interlarded with seams of greenstone, while there is no marble at all as marble is commonly designated. But the name suits the town as it is founded on rocks which look as though all the winds and waves of the mad Atlantic could never dislodge them; while the historic people of the town seem to have partaken of the solidity and sturdiness of its foundation. All through the Revolutionary times Marblehead was Boston's right-hand. A Marblehead Captain is said to have been the first to hoist the American flag, and Commodore Tucker "captured more British vessels, guns and seamen than any other Captain in the service" and his descendants are still there, sea-faring men, who ferry and row many thousands of people annually across the matchless harbor that lies between the quaint old town and the Neck, now planted with hotels and cottages for occupancy of the summer sojourners. The Neck is practically a long island, three miles in circumference, connected by a beach or causeway, to the mainland. While it has the harbor on one side, it has the open sea on the other so that one can sit and watch the ocean dash against the enormous masses of porphyry, or look across the quiet harbor, white with sails of yachts, to the old town which rises on its bluff of rocks like a medieval fortress. It was from a very early period the resort of fishermen who found the rocks a good place whereon to dry their fish, and so the town grew without plan or foresight. Wherever it was convenient between the rocks to put a house was one located, and the streets ran around to the houses without any formality of side-walks. The result is, that a quainter or more picturesque town does not exist in this country. Old St. Michael's Church, built in 1714, remains substantially unchanged. Its pastor, David Mossom, was the parson who performed the marriage ceremony for George Washington. As the town throve and men grew rich, it became quite a center of fashion. The Lee mansion, now used for offices, is a splendid example of anti-revolutionary architecture. It cost $50,000. Its hall and stairway are remarkably fine, and the paper is still on the walls which was manufactured expressly for them in England. Washington and Lafayette were both entertained here. A number of eloquent men have been born in Marblehead—among them, Elbridge Gerry, one of the signers of the Declaration, and Judge Story of judicial renown, and the father of a son equally eminent, the

sculptor, W. W. Story, who has lived for many years in Italy. During the years preceding the Revolution Marblehead was a commercial port, second only in importance to Boston. In 1839 there was a fleet of 98 fishing schooners owned in Marblehead, and manned by Marblehead fishermen. The town is not large, yet during the Secession War it furnished 1,048 men for the army and navy. Its patriotism is one of its notable features. This neighborhood was, in aboriginal times, a great rendezvous for the Indians who found the hard rocks peculiarly well suited for stone implements, and large collections of Indian relics have been made by the inhabitants. The flora of the region, notwithstanding the rockiness of the soil, is very interesting. Among plants peculiarly associated with Marblehead, may be mentioned the genista, or woad-waxen, the Deptford pink, Emerson's "Rhodora," the orchids calapagon and arethusa, violet, saxifrage, calombine, anemone, Houstonia, adder's tongue, bellwort, shadbush and meadow rue. The swamps in season are aflame with azaleas, blue flag and scarlet lilies, and in September the varieties of golden rod are *said* to number 28. I never found over eight or nine, but my own collection was made in one afternoon's careless saunter, and was doubtless very incomplete. After spending one day in the old town we were enabled to settle ourselves very comfortably on the "Neck" where I made it my first business to get well, and at the end of one week I was able to sit up all day, which for many a month I had been unable to do, and from that time on, my recovery continued. The effect of a strong sea air, upon some persons is quite magical, inducing sleep, and greatly improving the appetite. Upon the occasion of my second visit to the "Neck" in the following summer, the beneficial effect of the air was much less. It produced a great deal of headache from being too strong for me, but the fine appetite and good sleep resulted as aforetime. There were no pests in the way of mosquitoes, or gnats, to speak of, no sand—everything was as clear, and sweet as sea air and a clear sweep of sea winds could make it.

FOR THE GUEST CHAMBER.

BY OLIVE E. DANA.

THERE is no room that affords better scope for decoration than the "spare room," and there is no apartment or department where decorative skill, issuing in "fancy-work," is more legitimate or appropriate. Girlish fingers have been quick to seize their opportunity and use it. But it often seems a pity that the energy and skill here spent, were not materialized in some other form than that too often given them. Things which absorb so much time and strength, albeit they are the products of so-called leisure hours, should have three qualities which are not always found in them—utility, beauty, and durability. And there are many things really admirable and of lasting value that may be fashioned even by inexperienced hands for this apartment, things that a Penelope might own or over which one of our own Puritan grandmothers would not have disdained to bend.

Some of these things, designed for the guest-chamber of a new home, have lately come to my notice, and as I have watched them growing under busy hands in odd moments, I have wanted to tell the "RURAL" readers of them. And to begin with the bed, as one ought: It is a return to a fashion beyond our remembrance, this bestowal of needlework in dainty lavishness upon bed-linen. Our grandmothers did it, and maybe our mothers' trousseaux displayed a little of it, but it has been so long gone by that it is practically a new fashion. And who does not like the suggestion of womanly thrift about it?

In this case, the sheets were made of fine bleached cotton, with a hem of the usual width, or about four and one-half inches, above which the threads are drawn and a row of hem-stitching set in. The pillow cases, of width of course to suit the pillows, and also of a fine quality of cotton, receive a corresponding finish. One pair of sheets, with, of course, the pillow-cases to accompany them, receive a little more attention in that more threads are drawn and a row of fine, eye-trying Mexican work is inserted. Some people might prefer linen, when so much work is to be bestowed, but the cotton answers very well. We never outgrow our liking for white spreads, though we too, have lavished love and leisure on silk patchwork. And a downy, springy bed, made up with the bed-linen here described, nicely laundered, with only the usual snowy covering, for the outside, for the pillow-shams might well be spared, would tempt the weariest traveler to swift and sweet repose.

Next in order comes the dressing-case, and for this a long linen scarf, decorated as suits the taste or skill of the maker, is fashionable and sensible. Those I most fancy are of butchers' linen, moderately coarse, and unbleached. They are about one and two third yards in length, and a half-yard in width before making. They have all around a hem an inch and a-quarter in depth, done in narrow hem-stitch. In each end are three rows of drawn work, of the same width as the hem, with corresponding spaces between them. Across each end is a border of wide lace, crocheted of unbleached linen thread.

The bleached linen might be used for such covers, if preferred, and they are very pretty without the lace, in which case the ends should be finished with a knotted fringe. One row of the drawn work also makes a neat and tasteful decoration. With such a covering, the many mats of the old-time toilet-sets could well be spared, and the bureau display only the tasteful pincushion, a favorite material for which, and a durable one, is satin. It may be lace-covered, but is quite pretty without it.

The commode may be covered with a scarf similar to that intended for the dressing-case, though it may be elaborate.

Round mats of white cotton, crocheted in simple patterns, and with or without the edge of color, are dainty and serviceable.

And this article of furniture admits of one other bit of decoration both unique and useful, in the form of a pitcher-scarf. This requires one-third of a yard of butchers' linen, the width of the linen sufficing for the length of the scarf. It has an inch-wide hem, done in hem-stitch, and a row of drawn work in each end. It is to be hemmed only on the sides, as the ends are finished with knotted fringe some three inches in depth. This small scarf, it may be added, is to be thrown across the top of the pitcher, serving instead of the clumsier towel to keep out floating dust, which will otherwise settle on the water therein.

SMOKING IN PRIVATE.

J. H. G.

MANY of the ills to which human flesh is heir, are the direct result of smoking tobacco. It is impossssble to estimate or trace the evil consequences of the filthy habit. It affects the innocent as well as the guilty. The innocent victims of the tobacco curse may be numbered by the thousands. The person into whose face the deadly fumes are blown always suffers more than the smoker, who inhales the smoke only to blow it out again. How many delicate lives are wasting away in the polluted air of the home of the habitual smoker? The following story, vouched for by the New York Graphic, is an example of what is going on in thousands of homes all over the country.

"My little girl," said a pretty young mother the other day, "has been nearly killed by her father's smoking. You see when I married I determined to be very liberal and advanced, and to do what I could to make home as attractive to Tom as his club. Mother would never allow smoking in her house, except in the smoking room, but I made sage reflections upon the tactlessness of women in managing men and determined that Tom should enjoy me and his cigar together whenever he pleased. When my daughter Lillian first began to be brought out of the nursery she was as round and rosy a baby as ever you saw, but we had not been having her with us much as we sat together until she began to grow listless and pale and lose her appetite. I called in our doctor, but nothing did her any good; she seemed to be just dwindling away, and she continued to dwindle until her father was called away on business for a month. Then she picked up and was quite bright again by the time he came home. That happened several times, until I said to myself one day as she was frolicing with me: 'Her father never saw her like this.' Then it suddenly flashed on me that there was something very queer about this. The upshot was that we found out beyond a peradventure that it was living in her father's tobacco smoke that was killing the child. I don't feel so much wiser than my mother now as I used to, and smoking at our house is again practiced on ancestral principles—at the top of the house."

LETTERS TO A COUSIN.

I.

DEAR COUSIN: What do you do when it rains? If you know how to amuse yourself and appear pleasant and agreeable to others during a cold, windy, drizzly week I implore you to share your secret with me. Uncle George reads novels. He likes the kind with a hero, "dark, dashing and bold" and a "maiden fair with golden haire" and lots and lots of love. Do you want just such a book? Then get "Shandon Bells" or any other one of William Black's, for I think he writes the sweetest love stories under the sun. I used to enjoy them, oh so much! I think I shall never forget when "Three Feathers" was running in one of our weekly papers. I had been bribed by a dear aunt not to read any love stories for a year, with the promise that she would then give me something worth reading. So I did not read this story from beginning to end, but I could not resist the temptation to read "bits" of it now and then—with burning cheeks and a guilty conscience. Still I did not feel very faithless when I accepted "Little Women" at the end of the year, or think the reward unmerited. After that, all of Miss Alcott's books were read and re-read with delight. I think now that there have been no better books written for children.

I read the other day that the great Tolstoi cobbles shoes when it rains and he cannot get out to enjoy his favorite recreation of plowing or mowing. He says: "You cannot conceive what a satisfaction it is to plow. It is not very hard work as it seems to many; it is pure enjoyment. You go along lifting up and properly directing the plow, and you don't notice how one, two and three hours have gone by. The blood runs merrily through your veins; your head becomes clear; you don't feel the weight of your feet. But the appetite afterward, and the sleep!" There, cousin, did you have any idea that plowing was like that? But I remember you have brothers, who have probably expatiated at great lengths (as boys will when they get enthusiastic) about the calm, sweet repose that fills their souls after a day's plowing, and you have doubtless wished many and many a time that you were a man and could go out and share their joy.

Seriously, dear, the great man is right. Nothing "in the world" (Max O'Rell calls that expression an Americanism) is so health-giving and exhilarating as out-of-door work. I have planted out three long rows of sweet peas this afternoon and picked three quarts of strawberries, and I am sure I don't feel half so tired and stupid as I would if I had worked just three button-holes. Of course, a great deal depends on the point of view. If you like to work button-holes, it will not make you tired to do them, or three times three times three; but I imagine that three more would be like the "last straw"—and you would be too nervous thoroughly to enjoy resting as you could had you been digging in the garden for the same length of time.

I received a "Rocky Mountain" cactus today from a friend in Denver. She said it had lovely large pink blossoms on it when she found it, and she told me that if I have no room for it in the flower beds I should plant it in the vineyard, so I infer that it will grow in any place. But I have put it in a large pot and watered it with hot water—I have read in some place that hot water was best for cactus—and I hope it will flourish and be a credit to—to the fair donor (I had almost said to myself). If it doesn't I shall write an elegy on the "Transplanted Cactus," in which it will be made to mourn and pine away with longing and home-sickness for a waft of wind from its dearly beloved Pike's Peak; and Mary, when she reads of its untimely death, will feel that she was very, very cruel indeed ever to have sent it so far away from its kindred; even if they were a prickley set, I doubt not that they were just as dear to the heart of the little cactus, as one little downy chick is to another little downy chick.

Flowers are the loveliest of all gifts—don't you think so? I would rather have this little cactus than any elaborately embroidered fancy-work my friend could have sent me. The fancy-work that so many girls spend half their time in making grows old and faded in a few years if it is not kept carefully folded away, and what good is it to any one in that case. But a little slip of a begonia will have one or two flowers the first year; five or six the next, and 25 the third year, growing larger and more beautiful each succeeding season and it is constantly on exhibition so that all your friends may admire it. I admit that the plant might die and the argument would seem to be lost, but you know your tidy or banner might be whisked off into the fire and that would be equally disastrous. Flowers and pictures, and books and music—these are the gifts that give ever-increasing joy and consolation to the soul. A dainty little souvenir received at Christmas time was a book of Colorado wild flowers, containing some half dozen specimens—yellow columbines, some grasses from the mountains, the Indian Paint Cup, a purple flower I had never seen, and a spray of golden rod. I remember the little inscription under in gold paint was:

"Golden rod lifted her leaves to the sun;
He bent and kissed them every one."

Golden rod would be my choice for our national flower, but, as some one said, we have a bird for our emblem and that is sufficient, unless circumstances should give us a flower some day. To deliberately choose a national flower seems a cold, unnatural proceeding. There ought to be some legend sacred to the hearts of our countrymen connected with a thing of that kind.

But good bye, dear, and remember that you are to tell me how to spend a rainy week in the country. Remember that last clause and don't advise entertainments that are indigenous to the city alone. I have appealed to you because I feel sure that your Yankee inventiveness has long ago enabled you to find out some better way than we Westerners have for spending rainy days.

Affectionately your cousin,

DOCIA DYKENS.

GOLDEN GRAINS.

THE CHRISTIAN UNION reminds its readers that there is a time for all things and that very much of the trouble that exists in the world is due to the fact that we do those things we ought not to have done and leave undone the things we ought to have done.....

TIMELINESS is as important as fitness. The right thing may become wrong unless it is in the right time. Look well to the time of doing anything; there is a time for all things. Choose the right time for saying things. If your wife looks wearied and worn out, be sure it is not the right time to tell her that the dinner is not hot, or that the bread is sour. Comfort her—cheer her up.....

IF you are annoyed or vexed at people, just remember it is not the right time to speak. Close your mouth—shut your teeth together firmly, and it will save you many a useless and unavailing regret and many a bitter enemy.....

IF you happen to feel a little cross—and who among us does not at some time or other?—do not select that season for reproving your noisy household flock. One word spoken in passion will make a scar that a summer of smiles can hardly heal over.....

IF you are a wife, never tease your husband when he comes home, weary from his day's business. It is not the right time. Do not ask him for expensive outlays when he has been talking about hard times—it is, most assuredly, the wrong time.....

IF he has entered upon an undertaking against your advice, do not seize on the moment of its failure to say, "I told you so!" In fact, it is never the right time for those four monosyllables.....

O, if people only knew enough to discriminate between the right time and the wrong, there would be less domestic unhappiness, less silent sorrow and less estrangement of heart. The greatest calamities that overshadow our lives have sometimes their germ in matters as apparently slight as this. If you would only pause, reader, before the stinging taunt, or the biting sneer, or the unkind scoff passes your lips—pause just long enough to ask yourself, "Is it the right time for me to speak?" you would shut the door against many a heart-ache.....

THE world hinges on little things, and there are many more trivial than the right time and the wrong.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"FOURTH OF JULY."

"FOURTH OF JULY is coming again How shall we celebrate it?" is the question asked by all the boys and girls. Many families have a grand family picnic where all members, from grandfather down to the tiniest

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.

baby they can boast of, meet together to have a day of it. They go to some cool, shady wood where the old folks sit and talk of the days when they were young, play a few quiet games and talk of crop prospects, etc. The young lads and lassies swing, play "Jolly Tars," "Drop the Handkerchief," "Copenhagan," etc., the children jump rope, romp, climb trees, and race till luncheon is ready. What a jolly, jolly time they have then, eating all the best "goodies" from the pantries of half a score of good housewives. Then come singing, dancing, etc. Then the ride home in the moonlight. This is the way many of our farmer-folks spend the day. They have very few fire-works and they are better off without them.

In Manayunk and Roxborough (two suburban districts of Philadelphia, which used to be considered away off, but which now form part of the city) it has been the custom for many, many years to have the annual Sunday-School picnics on that day. All the schools turn out and march together. It is a very pretty sight to see hundreds of children dressed in their holiday attire, marching two and two, singing as they go.

The Fourth of July is exclusively American, and belongs wholly to the United States, hence the reason of the great demonstration which is manifested all over the Union. How many of our boys and girls ever stop to think of what they are celebrating for? How many of you remember that it was on the Fourth of July that the DECLARATION OF INDEPENDENCE, which made us FREE, was signed, in the year 1776? And how many of you can tell who the signers were? In these days when we have just been celebrating our centennial under the present mode of government, it seems to me that it would be quite apropos for us to have a little talk about this very matter. Shall we?

Well, then, to begin with—those who signed the DECLARATION OF INDEPENDENCE were as follows: John Hancock, William Floyd, Philip Livingston, Francis Lewis, Lewis Morris of New York; Richard Stockton, John Witherspoon, Francis Hopkinson, John Hart, Abraham Clark of New Jersey; Robert Morris, Benjamin Rush, Benjamin Franklin, John Morton, George Clymer, James Smith, George Taylor, James Wilson, George Ross of Pennsylvania; Josiah Bartlett, William Whipple, Matthew Thornton of New Hampshire; Samuel Adams, John Adams, Robert Treat Payne, Elbridge Gerry of Massachusetts; Stephen Hopkins, William Ellery of Rhode Island; Roger Sherman, Samuel Huntington, William Williams, Oliver Wolcott of Connecticut; Cæsar Rodney, George Read, Thomas McKean of Delaware; Samuel Chase, William Paca, Thomas Stone, Charles Carroll (Carrollton) of Maryland; George Wythe, Richard Henry Lee, Thomas Jefferson, Benjamin Harrison, Thomas Nelson, Jr., Francis Lightfoot Lee, Carter Braxton, of Virginia; William Hooper, Joseph Hewes, John Penn, of North Carolina; Edward Rutledge, Thomas Hayward, Jr., Thomas Lynch, Jr., Arthur Middleton of South Carolina; Button Gwinnett, Lyman Hall, George Walton of Georgia. The men who drew up and wrote this great Declaration were Thomas Jefferson of Virginia, Benjamin Franklin of Pennsylvania, Roger Sherman of Connecticut, Robert R. Livingston of New York, and John Adams of Massachusetts. It was signed in Carpenter's Hall, Philadelphia, Pa.

The boys (and girls, too) of to-day are to be the rulers of the future, and it is well to teach them what this blessed freedom which we now enjoy cost those brave men of the past, who gave or ventured their lives to gain it. Let each heart beat to the words of

"My country 'tis of thee,
Sweet land of liberty,
Of thee we sing.
Long may our land be bright,
With Freedom's holy light,
Protect us by thy might;
Great God our King!"

DORA HARVEY VROOMAN.

SCHOOL DAYS.

ANY one to whom school has always been a weary, monotonous drag to be escaped as early as possible and remembered with the other afflictions of life, will be satisfied with the title alone of this, and will turn to some other part of the paper, so my readers will be only those who have loving memories of their school days and at times long for their return.

Busy people sometimes live for years so wrapped up in their work that the world takes a great stride meant to benefit them, and they do not know it until some seeming chance or some lull in their rush of duties shows them what has been going on around them while they worked.

The schools for grown folks that have sprung up all over our country are examples of one line of these benefits for busy folks. The Chautauqua gatherings in all parts of the land, and the summer school for teachers, on the lakes, at the seaside, and on hills and mountains, with their enthusiastic gatherings, show that there are thousands who have a perennial love for school life when it is offered in attractive form.

There are now schools where any earnest student is welcome and can feel at home, no matter what his or her age or attainments may be, and where the newest methods of instruction make even the rudiments of knowledge interesting. The pioneer of these schools, with terms of only 10 weeks, so that students are coming and going all the year, at their own convenience, has been among us for years, waking up sleeping faculties, increasing and intensifying the powers of hundreds who come within its doors, and aiming every term to do more and better work for its students, at the least possible expense.

There are many thoughtful, studious people who are working alone at some favorite study—history, natural science, modern or ancient language—and they feel the need of stimulus from other minds bent to the same work. Every mind grasps a subject in its own peculiar way, as, for instance, each student of history reads differently between the lines, getting near the truth in proportion to the extent of his general knowledge and his ability to enter into the spirit of long-gone and wholly different times.

Viewing any subject through the eyes of another enlarges our thoughts of it. We look across fertile farm-lands to a glorious sunset and see that the whole landscape is made radiant, and we feel the beauty with keen enjoyment; but an artist friend comes into our circle and points out the tints that make up the glory in sky and earth, the blendings of one into another, and the soft shades of freshly plowed land and the deepened colors of woods and grain and pasture fields. And the artist's view of the scene comes like a fine old lace over an already beautiful fabric; it is ours, too, ever afterwards whenever we stand in the sunset glory.

So the lonely student will find that a few weeks in a class will bring to him new thoughts, give him new points of view and enrich his work. A teacher who knew of what he spoke said to his class:

"There are hundreds of people who would go to school if they thought they could." Many think themselves too old or that it is beyond the limits of their incomes. But we ought never grow too old to find pleasure in learning. Few energetic people do. The workers of the world enjoy the paper or magazine that is devoted to their work, and study it with the zeal of true students. Our people are alive to their own hunger for knowledge. The farmers and their wives know that the farmers' institute where they learn the most, is the one they enjoy the most. They renew their school days as they listen to the teachers of dairying, small-fruit growing, poultry or cattle raising, or general farming, and as they take part in the discussions, the old-time recitations are recalled.

Every faculty we develop makes us safer from sickness and discouragement, at least as eminent medical writers tell us, and one must be very irresponsive or out of tune with his fellows who can attend a gathering of men and women for study without finding growth and development for some part of his nature social, intellectual or moral.

Most, if not all of these schools recognize the human hunger for spiritual growth and are pervaded by Christian influences. During 10 weeks spent in one of these schools the feeling often came that those who were not filled with a Christian spirit were missing the best part of all the school had to offer them—not only in the Bible classes and daily religious exercises, but in every class-room and in every study, there are so much comfort and encouragement and deep pleasure in acknowledging God's hand in all the works studied.

It is so easy and natural but such a fatal thing to fill our days with critical or bitter thoughts of the imperfections of human lives and human learning; but by doing so we grow ugly and hard and bitter and more hateful to ourselves than to any one else. There is an eternity of good to strive for; there is a universe of God's wonders to explore, and "if we seek these things we shall find them" and grow into their beauty by filling our thoughts with their truths. If we are always awake on the "Godward side" of our lives, they will be broader, deeper and truer. If you are studying alone, go to one of the summer gatherings for study and inspiration; or if winter gives more leisure, find out the schools that are open all the year round, and go for one term. Everything grows by what it feeds upon—minds and spirits as well as animals and plants—and the higher faculties need food and exercise even more than the body needs them.

One term of hard work with enthusiastic thinkers can be made as profitable for the future as the busy days of harvest spent in storing up food. We all feel mental and spiritual hunger, and ought to work harder to satisfy this with good and wholesome food and surroundings than to provide for physical hunger. ALICE BROWN.

SOME JOTTINGS.

IN "The Family-Pocket-Book" discussion, I said nothing, not because of lack of interest, but because wiser people gave my views better than I could. I do know one thing, however: the average husband of to-day will not adopt Mr. Terry's views, and, as Victor Hugo said: "To reform a man you must begin with his grandmother," and Dr. Holland, when asked when the training of a child should begin, said: "100 years before he is born," I think the training had better be begun soon, if that golden day when both members of the matrimonial firm shall have equal rights in the family purse, is to come before the millennium dawns.

I know one thing more, too: if any one means to practice true economy, he or she had best keep a strict account of expenses. One never knows what things do cost till they are "put down in black and white."

All my Scotch blood protests against hearing oatmeal called "unwholesome." Properly cooked, served with cream and a little sugar, and properly *eaten*, that is, slowly, and accompanied by a slice of brown bread, oatmeal can not fail to give strength and plumpness to the eater. Of course, no two stomachs, any more than any two heads, or any two leaves on a tree, are just alike; but, next to "mother's milk," is oatmeal for "natural food" *I* say.

People are apt to attribute the "national disease, dyspepsia," to pie, and "this dreadful American climate, you know," but this dreadful American *hurry* is more to blame than anything else. If people would take time to masticate their food like human beings, instead of bolting it like dogs, and take time to live sanely in other respects, there would be less complaint of dyspepsia.

A recent article in the RURAL NEW-YORKER was made to refer to "*non* scientific temperance instruction," which was, of course, a mistake of the types, as the temperance instruction given in our schools is on decidedly scientific principles. AUNT BETTY.

Sole Agents for the United States, *who* (*inquire first*), if *your* druggist does not keep them,
WILL MAIL BEECHAM'S PILLS ON RECEIPT OF PRICE, 25 CENTS A BOX.

News of the Week.

HOME NEWS.

SATURDAY, June 29, 1889.

LAST Monday William Walter Phelps of New Jersey, Chief of the three American Commissioners to the Samoan Conference at Berlin, returned with the treaty made between the United States, Germany and England for the settlement of the late troubles in those Pacific islands, and the future control of the scattered kingdom. It is the general acknowledgement that the Americans secured every substantial point they made—because they were just, of course, and also because we were or seemed to be determined to fight for our objects and the other parties weren't willing to get embroiled with us about such a comparatively small matter in view of the present ticklish position of affairs much nearer home. The treaty signed guarantees self-government in the Samoan Islands under the joint control of the United States and Germany, England to act as arbitrator in the event of any differences arising. The Samoans are to elect their own king and sub-king or viceroy and to be represented in a senate composed of the principal chiefs and an assembly elected by the people. The Germans are to receive a small indemnity for their losses, and a special court is to be appointed to deal with the complicated land question Things will remain as they were before the treaty was completed until December..... On Wednesday Commissioner Phelps was nominated to be Envoy Extraordinary and Minister Plenipotentiary of the United States to Germany as a reward for his successful diplomacy in making the treaty. All agree that it is an excellent and well deserved appointment. The new Minister is nearly 50 years old, a New-Yorker by birth and a New Jerseyite by residence, rich, generous, thoroughly honorable, naturally clever, finely educated, with a knowledge of German and French, and four terms' experience in Congress. He is very popular here and also in Berlin, his return to which private business will delay for a short time..... A company to make lumber out of straw was incorporated in this State Monday..... Editor Noquin, of the Sentinel, New Orleans, the other day accused Editor Flacquet, of the Comet, of having been drunk at a picnic. Flacquet proved his hand was the steadier anyhow, by killing his traducer in a shooting scrape in the street.....The appropriations for paying pensions are all exhausted. Some attribute the blame to General Black, late Commissioner of Pensions, for not asking money enough; others lay it to Corporal Tanner, the present Commissioner, for squandering too much. The present fiscal year ends June 30, and the appropriations for the next year will be available after July 1. Already $90,000,000 have gone for pensions during this fiscal year, and Tanner wants $15,000,000 more..... .... During the last Administration the Lady of the White House was the butt of silly, ill-bred jokes from one set of witlings; during the present Administration, another set are busy poking similar jokes at the Baby of the White House..... Last Saturday the Montana horse Spokane, won the American Derby at Chicago, beating six others among them the Kentucky horse Proctor Knott, winner of the great $30,000 Futurity stakes here last year. His owner then refused $40,000 for him, expecting large winnings this year, but Spokane has defeated Proctor three times this season. The Derby was 1½ mile long; time, 2 41½; stake, $10,000. About $1,000,000 changed hands in bets. Spokane was the favorite at six to five on: the odds against Knott were two to one, and eight to one against the California horse Sorronto that came in a good second..... The Sullivan-Kilrain fight "The greatest of the century" is to take place near New Orleans on July 8, for $10,000 a side. Both men have been training hard and faithfully, and are reported to be in prime condition "fit to fight for their lives" They will start south in a few days. Betting is about even among disinterested outsiders; but the partisans of each are giving odds..... Nearly 400,000 acres of land in the Adirondacks have been sold to an Albany syndicate... ..... Monday the French-Canadians at home and in this country celebrated in style the feast of St. Jean Baptist, and the 353 anniversary of the landing of Jacques Cartier near Quebec—the beginning of the French settlement in Canada. At Fall River and Chicago, where French-Canadians are numerous, processions with allegorical cars and floats marked the day as joyously as in the Province of Quebec, and the fete lasted three days. Crowds of visitors flocked from all the surrounding country. The holiday originated in 1834 to commemorate the rebellion in Quebec when the English unsuccessfully attempted to banish the French language from the public schools.....Last Tuesday Mrs. Whiteling, the first woman ever hung in Philadelphia, suffered the death-penalty there at Moyomensing prison. She was 41 years old, short in stature and weighed 180 pounds. In the spring of 1888 she poisoned successively her husband, her nine-year-old daughter, and her two-year-old son, and after her arrest confessed the murders. She was to get a total of $199 in insurances on the lives All efforts to gain a commutation for this Borgia of the slums very properly failed. She died rejoicing at the certainty of soon meeting her murdered family in Heaven!.....Mrs. Lucy Webb Hayes, wife of the ex President, died at Fremont, Ohio, at 6.30 Tuesday morning, having never spoken a word or recovered consciousness since stricken with apoplexy the previous Friday. Born at Chillicothe, Ohio, in 1831, where her father, Dr. James Webb, was a prominent physician and active anti-slavery leader. Finely educated, refined, thoroughly amiable, sincerely religious, judiciously charitable, of medium hight and graceful figure, a model wife and mother, she was respected, admired and beloved in life, and is widely and sincerely mourned in death..... The longest legislative session ever held in Connecticut came to an end last week. The most important bill it passed was a makeshift modification of the Secret Ballot Law vetoed some weeks ago by Republican Governor Bulkley, who signed the new law last Saturday .....Senator Manderson of Nebraska, has just had his pension raised without soliciting, and been gladdened by the receipt of $6,000 for back pay at the higher rate.....On July 4, the Tammany Society will celebrate at Tammany Hall, this city, the 100 anniversary of its foundation and the 113 anniversary of the Declaration of Independence.....The Pennsylvania Prohibitionists are now likely to try to elect members of the legislature from the 29 counties that favored Prohibition, and then by political bargaining they will try to secure Local Option.....Thomas Nast the cartoonist, has just concluded a four-years' engagement with the publishers of the humorous paper, Time, of this city. He has just returned to N. Y. after a long sojourn in California.....Twenty of the leading nations of the world will be present at the International Marine Congress to be held next October at Washington. It will prescribe a number of maritime rules to be observed by ship-masters of all nations, and especially decide upon the limits of "navigation lanes" to be taken by vessels going east and west between this country and Europe, for greater safety in avoiding collisions between each other and with icebergs... .....Rev. William Henry Beecher, eldest brother of the late Henry Ward Beecher, died at Chicago on Sunday, aged 87 years..... An extra session of the Rhode Island Legislature will soon be called to revise the statutes regulating the liquor traffic..... Parson W. E. Howard, the convicted "electric" sugar swindler, has been sentenced to nine years and eight months' imprisonment at Sing Sing at hard labor, as "a swindler, perjurer and hypocrite." .....The lately organized British-American Association, at its annual session at Boston, the other day, "resolved" that Minister Egan should be recalled from Chili because he isn't in good odor with Englishmen. Among others, a copy of the "resolutions" was sent to Gov. Thayer of Nebraska, where Egan lived, and the Governor has bitterly denounced the association for unjustly trying to blacken the Minister's character, impertinent intermeddling, and impudent bigheadedness generally..... Ohio has 6,753 Sabbath Schools, but 6,000 more are needed to take in the half million youths still out of the fold.....The railroads in the Vanderbilt system have discontinued Sunday trains as far as possible. The Vanderbilt family, under the leadership of Elliot F. Shephard, is becoming quite religious..... Well clad, well educated, well fed, debonnaire Charles L. de Baun, defaulting assistant-cashier of the Park National Bank of this city, who had been always fully trusted, generously paid and well treated and had, in return, stolen from the bank $95 000, was sentenced, Monday, to five years and six months in Sing Sing. Same day tattered, ill educated, half-starved, dirty-looking L. M. Moore, who had never had more than half a chance, and didn't see that till it had swept by, was sentenced to six years in the same place for failing in an attempt to steal a $15 suit of clothes from a Baxter street Hebrew dealer in second-hand garments. De Baun stole deliberately for five years; Moore tried to steal on the impulse of the moment. One had everything; the other, nothing.....The Manhattan brass works, the largest makers of brass in this city, were cremated Monday. Loss $300,000.....The latest is a Glass Trust now being formed, to control all the glass factories in the country. It has already gobbled up nearly all in New York, many in Ohio and several in Pennsylvania..... In 1888 the government's revenue amounted to $6.32 per head of 60,000 000 population, and its expenditures, not including payment of the national debt, to $4 47 per head. The national debt amounted to $17 71 per head, and the interest thereon to 65 cents. The duties collected on imports were $3.47 per head, and the internal revenue $2 07.. ... Governor Foraker, of Ohio, was unanimously renominated, on the third ballot, by the Republicans at Columbus, on Wednesday, in the largest convention ever held in the State. After two ballots, all the delegates stampeded to Foraker amid the wildest enthusiasm. Born July 5, 1846 in Highland county; worked on a farm when a boy. Entered the army when 16 as a private, and came out at the end of the war a captain; graduated at Cornell in 1869, and was admitted to the bar in Cincinnati shortly afterwards Elected Judge of the Superior Court in 1870; defeated for Governor in 1883 by Judge Hoadly, but defeated the latter in 1885, and was re-elected in 1887. Democrats say he can't carry the State this time; Republicans say he can with a whoop. ....Wednesday the Rev. Dr. Bradford B. Raymond was installed as President of Wesleyan University, at Middleton, Conn....

General Simon Cameron died at his farm at Donegal Springs, Pa., at 8 o'clock Wednesday evening, June 26, having been prostrated with paralysis six days before. Born March 8, 1799; had a terribly hard struggle to get an education; but got it. Apprenticed in a printing office at 17; became owner and editor of the Harrisburg Republican in 1820. Elected State Printer next year and for the seven following. Entered politics in 1823 and soon afterwards became Adjutant-General, hence his title of General. Later became banking mogul, railroad magnate, insurance president, Indian agent, and United States Senator twice, Secretary of War, Minister to Russia, and again United States Senator twice, resigning at the age of 78, in 1877, to make place for his son J. Donald Cameron. Since then he has lived in comparative quiet. Always energetic, hard-working, shrewd, saving, a steadfast friend and a bitter enemy, and for a life-time a politician of politicians, he rose from poverty and obscurity to great wealth and political influence. Having outlived a multitude of enmities, full of years and honors the old man has joined the majority, leaving regret alone among the living..... Wednesday morning in a collision of three freight trains on the Pennsylvania railroad, 40 miles east of Pittsburg, 30 persons were killed and many injured. One locomotive and 30 cars plunged over an embankment into a creek 50 feet below. A car-load of lime set fire to the debris that remained on the track. None of the crew remained to tell the tale ... .Secretary Tracy says he will neither make nor permit to be made, in his Department, any appointment or removal on party grounds. Merit will be the only consideration in the Navy.....An association of colored farmers in South Carolina is said already to number 40,000 members. It is about to establish an exchange to promote business intercourse..... For the purpose of taking up all other indebtedness of the road, the Chicago, Milwaukee and St. Paul Railroad Company has made to the United States Trust Company of this City a mortgage for $150,000,000—the largest ever made..... A penniless young surgeon of the United States Army is going to marry $4,000 000 and a daughter of James G. Fair, the California bonanza king, and Nevada United States ex-Senator ..... Owing to the opposition to the execution of murderer Kemmler by electricity at Auburn, N. Y., about this time, a referee has been appointed to take testimony in regard to the effect of an electric current on the human body. The report is to be made on July 30, and Kemmler is, therefore, sure of at least a month's respite. Should the Courts decide the new law unconstitutional there will be some doubt whether any legal punishment for murder exists in this State since the law went into force, for, as it expressly repealed all previous laws on the subject, if it is itself unconstitutional, by what law will those who may commit murder until the enactment of another law, be punished ?.. How is it that the Democratic papers which for four years kept up the cry "Turn the rascals out," are all now either mum or grumbling that the "rascals" are not kept in?.....The engineers of the Union Pacific, instead of striking to obtain their "just rights," submitted their demands to arbitration, and now they've got all they wanted. Chief Arthur declares he will never again sanction a strike..... Just after President Harrison's inauguration Major Armes, a persistent crank, grossly insulted Governor Beaver of Pennsylvania at Washington by pulling his nose for a fancied insult. He was tried by court-martial and instead of being dismissed from the army, was mercifully allowed to remain on half pay for five years, on condition that he wouldn't go beyond 50 miles from Washington. A number of Pittsburg blackguards, who are disgruntled with the Governor, have just advertised their vulgarity by presenting the disgraced officer with a $100 gold medal as a token of their high appreciation of his cowardy affront in attacking an old maimed soldier. The fellow's friends say he will gladly accept and wear the badge of disgrace, though at the trial he swore that he had not even attempted the outrage..... Captain Winfield S. Schley who has been Chief of the Bureau of Equipment and Recruiting in the Navy Department with the rank of Commodore, has voluntarily resigned to take command of the new steel cruiser Baltimore, the largest of the new fleet, thus giving a practical illustration of his opinion that one man shouldn't monopolize a good thing too long..... Now 'tis the Detroit aldermen who are charged with boodlerism.....John Crouse of Syracuse, New York, has just left $10,000,000 behind him on this side of the Styx..... Vancouver, Washington, has, in great part, followed Seattle up in flames and smoke .....The embezzling bank officer this time is John Mc Master, teller of the Farmers and Mechanics' South-side Bank of Pittsburg, who has misappropriated only $150,000 .. ..The Treasury Department has spoilt the plans of a ring which had been formed to get millions from the Treasury through jute-bagging drawbacks....

In Harmony with Nature.

When we adjust effort to capability we usually succeed, for the highest good comes from acting in harmony with nature. How is this priniciple embodied in Compound Oxygen?

1st. It is composed of nature's simples in salutary adjustment Oxygen with Nitrogen, to which the vitality of positive magnet zation is added.

2d. It is administered, not for the purpose of usurping natures' prerogatives, but, to encourage and then preserve her kindly moods.

Here are cases in point.

STILLWATER, N. Y., May 31, 1887.
"I feel very thankful that my attention was ever called to Compound Oxygen."
E. H. SMITH.

ATTLEBORO, MASS., May 28, 1887.
"Those suffering from catarrh will find Compound Oxygen the most wonderful remedy of the age. That's a fact for we are using it!"—*Attleboro Advertiser.*

PLUMVILLE, PA., April 25, 1887.
"I am an earnest advocate of Compound Oxygen treatment and have recommended it to my afflicted friends." EMMA L. DAVIS.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 312 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, June 29, 1889.

AMONG the general European bellicose talk and belligerent preparations, a Peace Congress is sitting tranquilly in Paris. Some look on its members as sage messengers of "peace on earth and good will to men;" others as silly disciples of the immortal Three Tailors of Tooley Street..... Our old visitor, the Russian Grand Duke Alexis, has incurred the furious anger of his elder brother, the Czar, by his scandalous intrigue with the beautiful sister of the late General Skobeloff who is morganatic wife of Duke Eugene of Leuchtenberg, "the handsomest fool in Europe." Alexis has been deprived of his office of Lord High Admiral of the Fleet, and most of his other honors and banished to Siberia. Duke Eugene, who was an accommodating husband, has been sent from the Russian court and capital, and his wife has been granted "permission" to reside indefinitely abroad. Imperial morality is badly shocked by a blot on imperial dignity.....After heavy losses on both sides, the sea-going strikers at Liverpool, having been starved out have had to "cave in"—for the present at any rate.

Miscellaneous Advertising.

H. D. GILL, V. S., 332 E. 27th St., New York.

AGRICULTURAL NEWS.

SATURDAY, June 29, 1889

FROM the June Report of the Department of Agriculture we learn that the area of wheat is slightly in excess of last year's, and the condition high, although there has been some injury in certain localities from excessive rains and floods, gullying uneven or declining surfaces and inundating bottom lands. Whether this injury will make any considerable local reduction of reported averages will be determined later. In Pennsylvania, Maryland and Virginia this cause of reduced condition will have a perceptible influence on production. Special reports from Virginia say that wheat has not filled, and that fields with sufficient straw for 30 bushels per acre, will not yield 10. The fields present a beautiful appearance, but the grain is not there. This is owing to the extremely wet weather. In Dakota, wheat in the fields which were sown with frosted seed, is spindling and unthrifty. The average condition of rye is high. The average condition of oats indicates a medium crop. The usual breadth of barley is reported, and the condition is said to be good. Cotton presents the lowest average condition of any farm crop, the weather having been too cold, and the seed-bed too dry for proper germination, and later frosts have injured it to some extent. The area planted has been somewhat reduced on the Atlantic coast, and increased in the States west of Alabama. Peaches average poorly in the districts of principal production. Unseasonable frosts and wet weather have reduced the crop materially. New Jersey and Delaware promise very light crops, while Maryland and Virginia show better prospects.....The N. Y. State Board of Assessors met with the town supervisors and assessors of Orange county at Newburgh, recently. One supervisor said that he did not believe there was a single farm in Orange county actually worth its assessed valuation, while cities and villages are assessed on an average about 75 per cent. The State Assessors said they had found wherever they went through the State that farming lands were decreasing in value..... .....The two cars sent out by the California Board of Trade with the exhibits of the products of the State arrived at Jersey City last week. They have been visited by crowds of people. This free agricultural and industrial exhibition has been on the road since December 6, last. It was sent out to induce immigration to the Golden State.....New Bartlett pears have been received at San Franciso and sold at $1 per box. Very few choice Lima beans are on sale. The asking rate is $5 per cental..... ..... The Tenth Annual Meeting of the Society for the Promotion of Agricultural Science will be held at Toronto, August 26-27. W. R. Lazenby, Columbus, Ohio, secretary..... Considerable interest is being manifested in the possible enlarged production of California olive oil. The quality of such samples as came to hand during the early cultivation of olives on the Pacific equaled the high grade of Italian or Spanish pressings. There is a large line of trade that will support the venture if prices at all favor, as against the foreign make. Growers assert that they can compete in the article, and arrange themselves successfully with the producers who entered fruits which before had exclusive shipment from the Mediterranean..... The army worm has made its appearance in Elkhart county, Ind., and is going through the wheat, rye and oats at an astonishing rate. Farmers are much wrought up over its work..... .Another Dairy Conference was held at Spencer, Tioga county, N. Y., June 8. A picnic and institute combined were contemplated, but a heavy rain necessitated holding the meeting in the town hall, where a very interesting meeting was held.. ..... The Treasury Department has decided that so-called annatto, consisting of a solution of annatto and turmeric in cottonseed oil, and used as a coloring for butter, is not the annatto extract of commerce which is exempt from duty, but is properly classified as an unenumerated manufactured article, dutiable at the rate of 20 per cent. ad valorem.....E. T. Turner, C. E, has been appointed director of the New York State Meteorological Bureau and Weather Station.....Large numbers of Shire horses of best breeding and quality have been purchased during the last few weeks for exportation to this country. Nearly all are for breeders in the West.....A New York grocer was recently fined $50 for selling oleomargarine as pure butter..... Abbott & Blake have purchased the Clipper Machine Works at Keene, N. H., from the executors of the former proprietor, and will continue the manufacture of the Clipper mowers and reapers.....The 21st Annual Fair of the South Carolina Agricultural and Mechanical Society will be held at Columbia, November 11 to 15 A new main building has been constructed giving over 20,000 square feet of floor space. The railroads offer liberal excursion rates. The premium list is extensive and liberal, and an appropriation from the State legislature insures prompt payment. Thomas W. Hollaway, secretary, Pomaria. ..... Governor Hill of New York signed the bill giving the Hatch money to the Cornell University Experiment Station, but vetoed the bill providing for the distribution among existing agricultural societies of the unused appropriations of former years, and an item of $1,300 in the supply bill for printing 5,000 extra copies of the report of the annual meeting of the State Dairymen's Association..... The hop louse made its appearance in great numbers in some parts of Montgomery county. N. Y.....Australian lady bugs have been introduced into some of the California orange groves, and it is hoped that they will destroy the scale insect. This bug belongs to the same family as those found in New York, which are known to feed upon the hop louse.. .....

Indust'l Societies.

TWENTY-THIRD SUMMER EXHIBITION OF THE QUEENS COUNTY AGRICULTURAL SOCIETY.

(RURAL SPECIAL REPORT.)

THE summer exhibition of the Queens County Agricultural Society, was held at Mineola, L. I., June 19 and 20. Although the attendance was large and the display of implements, fruits, flowers, etc., fully up to that of previous years, yet it is a question whether it would pay to hold an exhibition at this season if it were not for the city and town patronage attracted chiefly by horse trotting. In short, the implement and horticultural display seems like a side show. The chief attraction and the thing which takes up most of the time are the trials of speed. In fact, horse trotting is made such a prominent feature of the meetings that it calls forth an apology from the officers in the premium list. They say:

"We recognize soundness, strength, style, speed and endurance as the valuable qualities of the horse. We believe it to be incumbent upon agricultural societies to encourage an improvement in each of these attributes. The horse best adapted to the general requirements of the Long Island farmer, and the horses which are developing the greatest fleetness, are the descendants of the same imported parents. We therefore offer special premiums for sound horses that shall show the most perfect combinations of rapid movement and staying powers, believing that, however much these qualities may be perverted upon the track, they are not one whit the less essential to complete attainment of the practical aims of agriculture. We believe the breeding of horses to be one of the most remunerative of farm industries. Liberal premiums are offered to overcome the neglect in which this branch of stock breeding has fallen."

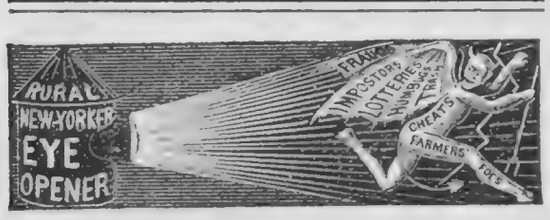
However we may deplore the depravity of human nature, it is evident that it is impossible to have a successful agricultural fair and a horse trot at the same time. As soon as the trotting began the main building and the plot on which the implements were exhibited were deserted, and with the exception of a few stragglers, remained deserted until the close of the fair.

The show of implements was very much more attractive than usual and before the trotting began attracted considerable attention.

H. M. Willis was on hand as usual with a full line of implements, some of which were of local manufacture. The Worcester Buckeye mowing machine which has had such an enormous sale in New England, was exhibited here for the first time. Its merits were apparent and quite a number of machines were sold. The Hudson Cultivator and Aspinwall Potato-planter attracted much attention. Potato growers were very enthusiastic in their praise of both implements. Aultman, Miller & Co. showed their new harvester. It is light, simple and apparently just the machine the Long Island farmer wants.

Mr. Albertson showed a great variety of implements. In the main building there was the usual variety of flowers and small fruits. Among the exhibitors who took prizes for flowers were Julius Schaff, of Floral Park; R. P. Jeffery & Son; Mrs. Titus, of Mineola, and others. For the best variety of vegetables the first prize was awarded to George Matthews of Great Neck, second to Parke Goodwin of Roslyn, third to J. H. Van Nostrand of Elmont.

J. H. G.



WITHIN the last fortnight the Eye-Opener has noticed reports telling how the old gold-brick swindle had been successfully practiced on six different persons in various parts of the country, and attempted in vain on another, who was probably a reader of the RURAL NEW-YORKER and therefore wide-awake to such frauds. Take a case in California as a specimen of the others, for, of course, the *modus operandi* in all is substantially the same. As usual, two adventurers "worked" the game. Their dupe was a farmer named Banks, who lived in Los Angeles county. A rough, bluff, hearty-looking, elderly man called on him and delivered to him a letter from a man by the name of Banks in Missouri The letter said that the Missouri Banks believed the California Banks was his brother and he wanted to tell him a secret worth big money. This he could get from the bearer, who was quite trustworthy. On inquiry, the bearer hinted at a fortune which could be obtained by purchasing a gold brick which an old Indian chief had brought from Mexico. The chief was then not far off, and was awaiting the messenger's return. Banks knew that the supposititious Missouri namesake couldn't be a relative; but his cupidity was excited. Accordingly he went with the stranger, saw the old Indian, heard a remarkable yarn about the finding of the gold, which had been melted into a brick for convenient handling, and received some drillings made from the brick in his presence. These he took to an assayer who declared they were rich gold. This was in the forenoon; in the afternoon Banks drew $5,000 from his bank and raised $3,000 more on some securities, making $8,000 in all; accompanied the stranger once more to the place where they had left the guileless Indian, and a transfer of the brick for the greenbacks was at once made. Two days later Banks carried his treasure to an assayer who dumbfounded him by declaring it was good brass. Sulphuric acid ate it when applied. On recovering his senses, Banks became furious, and after another assayer had confirmed the opinion as to the worthlessness of the brick, he applied to the police. The rascals were so well disguised, however, that there's little hope of capturing them. Last January the same men played the same game in the town of Los Angeles and cleaned up $5,000 from a wide-awake merchant!

In another case, a plausible humbug after hanging, in a quasi-mysterious way, about a farm in Yadkin County, Ohio, long enough to excite the curiosity of its rich old owner, easily got into conversation with him, and, after exacting a promise of secrecy, confided to him a secret which he had obtained from a moribund friend just before his death in the Illinois State prison at Joliet. Shortly before his arrest for another offense, in the Prairie State, he had robbed a rich jewelry store, in a large city, his plunder being chiefly gold vessels, watches and ornaments worth considerably over $12,000. These he had melted into a gold brick so that they could not be recognized and could be easily handled. Being closely pursued by detectives, he had buried his treasure on that very farm, and having been captured shortly afterwards, had never been able to recover it. Expecting to escape or secure a pardon, he had kept the secret until he disclosed it to his friend on his death-bed. The stranger then produced a worn diagram of the place where the treasure lay concealed, and promised the farmer a share of it, if he could identify the place. From several landmarks on the crude drawing, this was readily done. With the utmost secrecy the two dug at the spot indicated, and after a while struck a small box containing the brick. Next day they went to the neighboring town and submitted to a jeweler filings taken from one of the ends of the brick. He had no hesitation in declaring they were 18 carat gold. After leaving the store, the stranger appeared to become frightened at the sight of a man who passed them more than once and appeared to scrutinize the brick-bearer closely. The latter said the man was a detective who had, he feared, recognized him, and after some talk, he persuaded the farmer to pay him $6,000 for his interest in the brick. Though he declared it was worth over $11,000 he was willing to accept $6,000 at once so as to escape straightway into Canada. He may have done so, for neither the farmer nor the officers set on his tracks have hitherto found him. Of course, the brick proved to be merely brass. It had been buried some time before, and the diagram had been roughly handled to give it the appearance of age. The swindler was well paid for the ingenuity and patience with which he had worked the game, even if it had taken him a month to achieve success. In both these cases and in all similar ones, one or more parts of the brick are made of genuine gold—either a little bit on one corner or the plugging of a hole or both—and filings or drillings of these are submitted to experts so that the dupes may believe that the whole brick is composed of the same metal. It is a swindle frequently practiced, and as the right sort of greedy, gullible, rich simpleton is usually selected with care beforehand, it is generally splendidly successful.

NO CLASS is free from the depredations of swindlers. These sleek, soft-spoken, plausible gentry have no more reverence even for the clergyman's cloth, than is to be found in the heart of the toughest blackguard in a city's worst slums. A pair of rascals have lately been victimizing dear, innocent parsons in various parts of New Jersey under somewhat peculiar circumstances. They have been driving round in a buggy, after having first sent notices to their intended dupes that they are about to call. On arrival, they exhibit pieces of broadcloth which they represent as the very finest goods made in England, and they declare that they are sold to ministers only. They generally manage to make a sale; but on taking the cloth to the tailor their dupes always find that it is very poor stuff, worth very much less than the prices charged. Really, however, they ought to be thankful that they got anything at all for their money, as such swindlers generally manage to leave their victims completely in the lurch.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

THE NEW DOG LAW FOR NEW YORK STATE.

S. N., Medina, N. Y.—I notice by the papers that Governor Hill has signed a new law from which New York, Kings and Erie counties are exempt. What are the provisions of the new law?

ANS.—The law referred to is known as the Mase law. It provides for the collection of the following taxes upon dogs over four months old: Upon every bitch owned or harbored by any one or more persons or family, $3; upon every additional bitch, $5; upon every dog other than a bitch, $1; and upon every additional dog other than a bitch, $2. Every owner of a dog shall cause the same to be licensed, annually, on or before May 1, and to be registered in the office of the clerk of the city, village or town. The clerk's fee for each dog registered is 15 cents. All licensed dogs must wear collars, marked with the owner's name and its registered number. Every person owning or harboring a dog, who shall neglect or refuse to have it registered is liable to a fine of $3 to $7. These fines are to be placed in the county treasury to the credit of the fund constituted for satisfying such damages as may arise in any year from killing or injuring sheep by dogs in the county. Any dog not registered or collared may be lawfully killed by any constable or policeman, who shall be paid 50 cents for each dog so killed. When it shall appear by certificate of the fence-viewers that the owner of any sheep killed or injured by dogs has sustained damages which he cannot collect from the owner of the dog, or in case the owner of the dog cannot be discovered, such damages shall be paid by the County Treasurer from the fund to be raised by the dog tax, and from other moneys. As stated by our inquirer, the law does not apply to the city and county of New York, or to the city of Brooklyn or Kings county, or to the city of Buffalo or Erie county. Neither does it apply to any dog owned by any person, association or corporation engaged in the business of breeding dogs or rearing pedigreed or registered dog stock for the purpose of exhibition under the rules and regulations governing the American Kennel Club.

How to Cure Skin & Scalp DISEASES with the CUTICURA REMEDIES.

THE MOST DISTRESSING FORMS OF SKIN AND scalp diseases, with loss of hair, from infancy to old age, are speedily, economically and permanently cured by the CUTICURA REMEDIES, when all other remedies and methods fail.

CUTICURA, the great Skin Cure, and CUTICURA SOAP, an exquisite Skin Beautifier, prepared from it, externally, and CUTICURA RESOLVENT, the new Blood Purifier, internally, cure every form of skin and blood disease from pimples to scrofula.

Sold everywhere. Price, CUTICURA, 50c; SOAP, 25c.; RESOLVENT, $1. Prepared by the POTTER DRUG AND CHEMICAL CO., BOSTON, MASS.

Send for "How to Cure Skin Diseases."

Pimples, blackheads, chapped and oily skin prevented by CUTICURA SOAP.

Relief in one minute, for all pains and weaknesses, in CUTICURA ANTI-PAIN PLASTER, the only pain-killing plaster. 25c.

Practical Hints TO BUILDERS.

A LITTLE BOOK of 100 pages containing solid facts that every man contemplating BUILDING should know before letting his contracts. Short chapters on the kitchen, chimneys, cistern, foundation, brickwork, mortar, cellar, heating, ventilation, the roof, and many items of interest to builders. Mailed free on receipt of 10c. in postal stamps Address **National Sheet Metal Roofing Co.,** 510 East Twentieth Street, New York City.

TO LADIES.—MRS. L. L. JACKSON'S popular **Dress Guide** and **Self Instruction Book,** completely revised, with **Sleeve Guide,** for cutting latest style sleeve, now ready. Simple, satisfactory, perfect. Send for circulars Address **FAMILY DRESS GUIDE CO.,** Box 131, Indianapolis, Indiana.

WIND MILLS

34 YEARS Experience.

THE HALLADAY PUMPING MILL is acknowledged the Standard Wind Mill of the World and is made in 18 sizes, 8 to 60 ft. diameter, 1 man to 40 horse power. It is adapted to pumping water for Stock and Dairy Farms, Ornamental and Village Water Supply and Fire Protection, Railway Water Stations, Irrigation, Drainage, etc.

THE HALLADAY is made upon honor and guaranteed THE MOST POWERFUL, DURABLE and, BEST REGULATED, STORM DEFYING Wind Mill Made.

U. S. SOLID WHEEL WIND MILL

7 sizes, 10 to 22 feet diameter. Not cheaply made but heavy and strong in construction. These Mills are taking the lead of all Solid Wheels on the market, and are guaranteed the Best of their class.

PUMPS

We make a very complete line of WIND MILL, HAND AND POWER PUMPS. IRON, BRASS AND BRASS LINED CYLINDERS. Our 3 Way Force Pumps have no equal.

TANKS We make the largest assortment of Tanks on the market, consisting of Round, Half-Round and Square Stock Tanks, Milk Cooling Tanks, Storage and House Tanks Special sizes made to order.

STANDARD HAY TOOLS

For stacking out in fields and mowing away in barns. The use of a good Hay Carrier and Fork a few hours before a storm, may save many times their cost. We make the most complete line of Horse Hay Tools on the market, consisting of Anti-Friction, Swivel, Reversible and Rod Hay Carriers, Harpoon and Grapple Hay Forks, Pulleys, Floor Hooks, etc.

We also make the HALLADAY STANDARD GEARED WIND MILL, in 11 sizes, 1½ to 40-horse power, Corn Shellers, Horse Powers and Jacks, Stalk Cutters, Feed Grinders, Saw Tables, Tank Heaters, &c. All goods guaranteed. Send for Catalogue and Prices. Reliable Agents Wanted in all unassigned Territory.

CATALOGUES, ETC., RECEIVED.

NEW JERSEY EXPERIMENT STATION.—Ninth Annual Report. A great deal of the matter contained in this volume has already appeared in the R. N.-Y. The director makes a very remarkable statement when he says that there are in New Jersey, 2,069,819 acres of upland unimproved, of which more than half are now capable of profitable cultivation. He also says that there are in New Jersey—generally supposed to be the State most in need of manure and fertilizers—soils which have, within six inches of their surface, enough potash and phosphoric acid to supply the crops for 100 years to come, and a good stock of nitrogen besides. They need "a more complete exposure to the benignant influence of air, moisture and warmth," in other words, better plowing and harrowing. A feature of the report is an account of the investigations made to indicate the value of waters suitable for the production of food fish and shell fish. There are 150,000 acres in New Jersey that are capable of being utilized as oyster farms. There are also 13,000 acres in lakes, ponds and streams in which valuable fish can be produced. The Biologist of the Station gives quite a long account of the oyster interests of New Jersey, that will prove instructive reading to all who like oysters. The R. N.-Y. is glad to see the New Jersey Station take this interest in oyster culture. An enlargement of the business will increase the revenues of the State and make more plentiful an excellent article of food. The R. N.-Y. has frequently called attention to the value of the sorghum sugar industry to New Jersey. The pith of what is stated in this report is that in any good farming section of Southern New Jersey, the farms within one mile of a sugar house can be made to produce 222,000 pounds of sugar without disturbing the present system of crop rotation. The station has continued its experiments with Alalfa, and is still confident that it is a profitable plant for New Jersey farmers.

MINNESOTA HORTICULTURAL SOCIETY.—Volume 27 contains a report of the proceedings of this society from March 1888 to March 1889. It is a very interesting volume. The essays are pithy, practical and pointed. We are very glad to see that the ladies are given ample space in which to discuss the best methods of cooking and eating the products of horticulture. There is one quite remarkable feature in this volume, that we have not noticed in others. The managers requested horticulturists of other States to send suggestions as to crops that they thought would be particularly suited to Minnesota soil and climate. This has resulted in some excellent suggestions. The grape, the cranberry and the blueberry are suggested as fruits that might be made to serve as special products of Minnesota. Minnesota blueberries ought to become a valuable commodity. The members of the Horticultural Society seemed to think so, for they spent quite a little time in discussing the practicability of transplanting the bushes and even cultivating them. The general opinion seemed to be that this could be done with profit.

FODDER ANALYSIS, ETC.—Bulletin No. 6 of the Cornell University Experiment Station is devoted to the consideration of various topics pertaining to agricultural chemistry.

FEARLESS THRASHING MACHINE.—Catalogue of the Empire Agricultural Works, Minard Harder, proprietor, Cobleskill, N. Y. The "Fearless" is evidently disposed to be true to its name. It seems not in the least afraid to compare itself with any other thrashing machine now before the people. The reasons for this confidence are easily found in the catalogue which ought to be examined by all who think of buying a thrasher. The R. N.-Y. knows they will be interested in the catalogue and it feels sure they will meet with honorable treatment in their dealings with this house. The Smalley ensilage and fodder cutters are also made by this firm, which has secured the exclusive right to sell these implements in the East.

AMERICAN NURSERY ASSOCIATION.—The enterprising secretary of this association, Mr. Charles A. Green, sends advance sheets of the essays read at the late meeting in Chicago. There are many useful things in these essays, which the R. N.-Y. will give its readers in due time. The great trouble about making an abstract or a quotation from these essays lies in the fact that they are so compactly written that it is hard to condense without spoiling them. When these essays are published in book form every person interested in buying or selling nursery stock will want a copy.

A NEW METHOD FOR ESTIMATING FAT IN MILK.—This is described by Charles L. Parsons in Appendix C. of the New Hampshire Experiment Station. Mr. Parsons repeats the well known argument in favor of the testing of cows. It is not very pleasant to think that there are still dairymen who feed and handle cows that do not give milk enough to pay for their food, yet we know very well that such men live and try to do business. Again, it is necessary that some distinction should be made between the different samples of milk sent to a creamery. If this is not done, some of the patrons will be called upon to help carry those of their neighbors who produce thinner milk. Mr. Parsons gives the Short's method, described at length in former RURALS, full credit; but quotes its author as saying that it will not give accurate results with milk containing under one-half of one per cent. of fat. This, he thinks, shuts out the analysis of most skimmed milk and some butter-milks. His process is somewhat like that devised by Prof. Short—in some respects simpler. He uses four solutions: gasoline, caustic soda, alcohol and soap, and acetic acid. Prof. Short uses two solutions, a mixture of caustic soda and caustic potash and a mixture of sulphuric and acetic acids. It is needless for us to give the details of this method. As it all depends upon tables of figures printed in the bulletin, the reader might just as well get the bulletin himself and study it out.

DANGER IN DECOMPOSING FOOD.—Prof. H. E. Stockbridge, of the Imperial College of Japan, was called upon to examine food eaten by persons who died suddenly with symptoms of narcotic poisoning. He publishes his report in the form of a bulletin. The food consisted of a variety of edible mushroom and a native dish consisting of a mixture of fish and rice. After a very patient research, Prof. Stockbridge discovered a compound which he identified as muscarire, the poisonous constituent of the "toad-stool," and he also proved to his satisfaction that this substance was developed in the native dish of rice and fish which is allowed to become very "strong" before being eaten. This is the first reported case where death by poisoning has been traced to this substance as a product of decomposition, but there are good reasons to think that it is first simply because no previous examinations have been made. Prof. Stockbridge concludes that "we are forced, by the facts developed in his analyses, "to recognize the danger of eating either animal or vegetable food after decomposition has begun, since this process may result in the development of deadly poisonous alkaloids resembling in physiological properties, strychnine, morphine, brucine, and other of the most powerful poisonous alkaloids hitherto known only as products of vegetable growth. Many diseases of a cholera-like character, perhaps even this most dreaded malady itself, may result from the consumption of food in which the process of putrefaction has begun. From a legal standpoint, chemists, physicians, and jurists are now compelled to recognize the possibility that many supposed cases of criminal poisoning are in reality the result of ptomane-formation, either in food or in the decomposing body after death."

Three weeks ago, Mr. Gregory, in these columns, took the ground that the danger from eating decomposing meats was largely or entirely removed by a thorough cooking. Prof. Stockbridge's experiments indicate that there is danger in eating decomposed vegetables and fruits, many of which are eaten raw

POTATO ROT.—In Bulletin No. 2, Volume 2 of the Tennessee Experiment Station, Prof. F. Lamson Scribner discusses two diseases of the "Irish" potato. Every person who has ever raised potatoes is acquainted with potato rot, yet not one in 1,000 has ever tried to find out what this rot is, its cause or its remedy. Prof. Scribner's examinations have been very carefully made and he has succeeded in making his description remarkably clear. There is more "mystery" about the growing of the potato crop than about that of any other crop grown on the farm. The wisest and most carefully planned arrangements are quite often upset. Rot has done its full share toward doing this, and potato-growers will be glad to have an opportunity of fighting the disease intelligently. Prof. Scribner says that the disease known as potato rot, results from the growth of a parasitic fungus on the potato plant, similar in habit and botanically related to the downy mildew of the grape. The growth of this parasite is favored by or even dependent upon certain climatic conditions. The disease is most severe on heavy, poorly-drained soils, or in seasons when foggy, sultry weather prevails. Prof. S. says there is nothing to prove the quite prevalent belief that rot is due to an enfeebled condition of the potato plant resulting from years of cultivation. He says, in fact, that "it is not the climate, or the soil, or any vital exhaustion of the potato itself that causes the rot; it comes from the attacks of a minute parasitic plant which infests the potato, penetrating in its growth both the tops and the tubers."

This parasitic plant belongs to the class of fungi and is of microscopic size. When a man is told that his potatoes are being eaten up by potato "bugs," it is easy for him to understand what is meant. When he is told that these fungi are devouring his plants—rotting them—it is not so easy to understand, because while the "bugs" can be seen, the fungi are invisible to the naked eye. Yet, the only difference is, that the fungi break down the tissues while the "bugs" devour them. Plants may become diseased from the stems or from the seeds. The effect on the tops of the potato plants is to produce what is known as blight. The vines are killed to the ground and then the tubers begin to rot. The spores, a germinating principle of the fungi, are so small and light that they are carried through the air without difficulty. When they alight on potato vines in sufficient numbers and have moisture enough, they at once begin to develop and if wet, sultry weather continues, the chances are that they will spread over the plant and cause "blight." For such attacks Prof. Scribner recommends the Bordeaux Mixture, so frequently described in these columns. In fact, almost any preparation containing sulphate of copper seems to kill the fungi. The "germs of the rot" are frequently put into the soil with the seed pieces. Great care should be taken in the selection and preservation of potatoes for seed. Moisture is the great promoter of the evil, and, while we cannot control the weather, we can plant only in dry, well-drained soil, dig in dry weather and keep storage pits or cellars dry and cool. The fungus is most active between 60 and 70 degrees F. At 40 degrees its development is insignificant, while at, or about 80 degrees, the vitality of the spores is quickly destroyed. At 105 to 110 degrees it has been found possible to destroy the germs, and this temperature, maintained for a few hours will not injure the tubers for seeding purposes. It is also said that the tubers may be disinfected by soaking them in a solution of sulphate of copper before cutting.

MAGAZINE REVIEW.

LIPPINCOTT for July is of peculiar interest to American readers, dealing as it does with individuals and topics which have had so much to do with our country's greatness. The second instalment of "Recollections of George W. Childs," deals almost entirely with General Grant, with whom he was very intimate from the time he formed his acquaintance in 1863 until his death. He gives us such an insight into his life and character, as can be given only by one intimate friend of another. We learn a fact not generally known that General Grant had considerable artistic taste and talent. A reproduction of one of his paintings is given as a frontispiece. "Our Greatest Inventor" is described to us as Captain John Ericsson. The general public knows of him chiefly as the inventor of the Monitor, the destroyer of the Merrimac, but this is a very small part of his many wonderful inventions, several of which are enumerated in this article. The "twin screw propeller" with independent engines, which has just been used so effectively by the steamer City of Paris and is now talked of as a brilliant novelty, was used by Ericsson more than 50 years ago in a Thames river tug-boat, and again nearly 20 years ago in 30 different gun-boats built by him for the Spanish government. It is certainly not very creditable to our government that its indifference, to put it in a mild form, should allow these and similar inventions to be appropriated by foreign powers. He built the first steam fire engine, the first tubular boiler, and in seven weeks, when only 26 years of age, designed and built an engine which ran 30 miles an hour. His diligence and devotion furnish an example worthy of emulation by the youth of his adopted land. In "Authorship in the South Before the War," Thomas Nelson Page gives his views of the causes that led to the comparatively small amount of literary work done in that section. Judge Tourgee contributes another instalment of "With Gauge and Swallow" under the sub-head of "A Dissolving View," the old firm dissolving upon receiving another partner. The complete novel is by M. G. McClelland, and is entitled "Ten Minutes to Twelve." Some choice bits of poetry are sandwiched between the longer articles, and the other departments are well filled with their usual complement of good things. The answers under "Our One Hundred Questions" contain much interesting information. Edgar Fawcett criticises Mrs. Chanler's last novel, and Anne H. Wharton has some satirical remarks to make about "The Courtesies of Summer Resorts." J. B. Lippincott Co., Philadelphia, Pa.

What are You Farming For?

SENSIBLE REASONS GIVEN.

FARMING NOT ALL "A DOG'S LIFE."

The "Bright Side" in Plain View.

OUR readers will remember that last winter we asked for answers to the above question —"What are You Farming For?" It is evident that a man should be able to give some reason for conducting the business that provides him a living. The question was asked in good faith. The R. N.-Y. has always contended that *farming* is an honorable, pleasant and fairly profitable way of making a living. While it is pleasant to have this idea confirmed, we should cheerfully have published the result had it been different. The Fourth of July season seems a fitting one for the printing of these answers. At the time of this glorious holiday we should, if ever, be proud of our country's prosperity and thankful for the chances our land affords for pleasure and happiness. These answers have been selected at random. There are hundreds more like them.

FROM ILLINOIS.

I BELIEVE this is a good subject for discussion. I have lived in town, but not since I was large enough to do much work. I have thought a good deal on the advantages of various lines of occupation outside of farming; but I have always come to the conclusion that with the same amount of business sagacity needed to succeed in any other business, farming would yield as large a net profit and be more healthful and at the same time afford a more enjoyable diversity of employment, with the advantage for those engaged in it of not being tied so closely to the office or the hot city. Of course, with plenty of money any business can be managed so that recreation can be taken. My natural leaning and disposition seem to give me a liking for the farm, though I have found that it requires more painstaking effort and more thorough knowledge on nearly every subject than I possess, to make a brilliant success. It appears as though capitalists and corporations of all kinds conspired together to fleece the farmers; but still I believe that mill and factory hands and other day laborers in coal mines and large cities have the hardest squeezing at such times as the present when flour, or any other staple necessity, is suddenly advanced in price without any advance in wages.

I am a farmer then, because,

1. I like a farmer's life best.

2. Because I seem fitted by nature for the rough farm life.

3. Because I believe it is the most healthy and enjoyable.

4. Because it affords an interesting and unending series of subjects for study and investigation. W. S.

Pleasant Valley.

WHY do I farm? For health, pleasure and profit. Health comes from the out-door life; pleasure from the contact with nature; profit from a good farm and good farming—an additional source of pleasure. J. G. P.

Cedarville.

FROM CONNECTICUT.

IF I were to answer: "I am farming for a living," the question would be equally proper: "What are you living for?" At the age of 40 I bought a run-down farm and began farming "to make it pay," and soon found I had a long and laborious task before me, and in reply to the inquiry often made: "Does it pay?" I could not say "no," which would imply that I was working for *naught* or without an object. I prefer to answer, *Yes.* I love the occupation, God is my landlord, and I am His tenant, and I will do what I can towards raising provisions for my brethren in other occupations, while they are exerting themselves to supply those wants which I have neither the humor, taste, capacity, nor time to attend to. One brother has supplied me with an engine, which greatly reduces the labor of cutting feed for my stock, etc., etc.; another has invented a machine for mowing my hay, which causes a great saving of labor, and another has improved it so that I can mow a swath of seven feet instead of four, with little, if any, additional labor for the team. Another has lately supplied me with a plow, on which I can ride, and do more, and better work than I could in the old and far more laborious way. And still another brother, has sent me a potato-planter, with which a man with a helper, can furrow, distribute phosphate, drop the seed, and cover it, at the rate of five to six acres a day, and do the work better than it was possible to do it in the old way. Then I have several brothers who are doing their utmost to gain information about the prices of farm products, and the best markets, and the most improved methods of production, and sending the news to me every week. These brothers have helped me wonderfully in the management of my business as a tenant, enabling me to increase my products greatly, and greatly to reduce the manual labor. Can I say that "farming don't pay," when I derive so much pleasure from the occupation, and have so many intelligent and willing brothers to help me, each in his own way, and in a way in which I could not help myself? J. J. WEBB.

New Haven County.

FROM VIRGINIA.

"WHAT am I farming for?" I spurn with disdain the idea that it is because I can do nothing else, and I have little regard for the man who has little enough sense to advance such an idea. I farm chiefly for two reasons: 1, because when I arrived at the years of maturity, with due thought and consideration I chose this as my vocation in life, not because I could do nothing else, for I had sufficient means to take a first-class professional education or to engage in any business requiring a moderate capital; nor were any influences exerted over me to direct my choice. The fact is that I was encouraged to take to medicine. Since I have been a farmer (about six years) although I have not at all times been successful, still each day has brought to me a greater love for my business and a satisfaction with my choice, and a determination to add my mite to the promotion of its interests. 2. I believe farming to be decidedly more conducive to good health than many other kinds of business. And now from a business standpoint, I would not exchange places with any gentleman in New York or any other city, because I value contentment more than money. R. R.

Peaksville.

FROM IOWA.

YOU ask me what am I farming for: here is my answer in four words: To get a living. When I started in life I put on the farmer's yoke and have worn it ever since. I was energetic and had a love for the work and I thought that as the years rolled by the yoke would cease to gall, that I would lay up a competence that would make my paths those of pleasantness and peace. In 30 years of arduous toil and strict economy, this has been partly realized; but not to the extent that I expected, and I find that to-day unless I practice strict economy, watch my business closely and keep abreast of the times, the yoke becomes burdensome. This I believe is the experience of very many farmers. They are losing their interest in their work and are on the defensive in trying to keep the wolf from the door, and I have no doubt that this state of things will exist until the cause is removed and the farmer gets his share of the profits of the country.

Belle Plain. H. B.

WHY do I farm? Because I was raised on a farm and love to farm, but it is very trying to one's ambition to be a renter and move from one place to another. Almost all landholders think anything is good enough for a renter; such a one cannot have everything to suit his notions. A renter has to work at a great disadvantage and is blamed for not doing better. There are so many renters that want to take care of farms, consequently a good man has to suffer with the poor ones.

Blevinfield. W. H. G.

FROM NEW YORK STATE.

"WHY am I a farmer?" This question has raised quite a train of thought in my mind, and I have not come to a very satisfactory conclusion, as there are a number of reasons for my being a farmer. I was born a farmer, or rather the son of a farmer, and when I say that, I mean that my father was a man who took such an interest in his farm that he was anxious to have it look nice and produce good crops. I was encouraged in such ways by his actions, and was taught that the farmer's life was not one to be despised, and that the tradesman must look to the farmer for support, as "the farmer must feed them all." While attending school I was encouraged to write compositions on the different occupations of the farm. There was a flower-bed near the house that was mine, and also a place for setting out berry-bushes, etc. But that was a rough place, where nothing but weeds grew. I had to dig these up and get out the stones and prepare the ground ready for the bushes, so I was taught that it was not all easy work. But then, I have not had the advantages that others have had on account of lack of means, nor what I might possibly have had, had not my father been called to rest from his labors and trials when I was only 18, and, being an only son, I had to take charge of the farm and help support the others. And from that time to this I have had encouragement from a loving mother and sister to do the best that my means would permit, and we have also had the RURAL and other papers and books to encourage us to higher aims. And my determination is to so improve my farm as to make it equal to the best around us, if I cannot get it ahead, or if I cannot attain to the hights that the professors of our colleges have attained, and numbers of others that I might mention.

Then when I contrast my occupation with those of friends who are in business in the villages around me, and see the lives they live, I conclude that I am as well off as they are, although some have things nicer than we, and have more advantages as to society than it is possible for us to have. But if I am not mistaken, all can see things that they wish they might have different from what they do have. G. A. B.

Groton City.

I AM inclined to think with many others that "farming don't pay," from a business standpoint, and socially and intellectually it is almost a complete ostracism. Between paying taxes and other necessary expenses and striving to make both ends meet, the intellect generally gets "stunted" and narrowed down to two ideas: how to make $1 go as far as $5, and how to economize more closely this year than last. But notwithstanding all this, farming has a bright side and I hope all may see it. They will if they look for it, for it consists in the liberty, sunlight and fresh air, in the flowers of spring, the green fields of summer and the fruits of autumn, and even in the frosts of winter. To the student and lover of Nature, country life is an earthly paradise. M. T. W.

Sandy Hill.

I FARM with the intention of improving the farm. I always try to leave a field in better condition when sown down to grass than when plowed up. I think that the farm is a very good bank to make deposits in, and I regard it as much safer than most of the ordinary banks. J. B. MC C.

Mount Morris.

I FARM because I like it. I am built that way. I believe farmers don't get the pay.

Lockport. W. H.

FROM MICHIGAN.

I FARM because I think that it is the most honorable and independent occupation a man can follow. If one tries to make home attractive and pleasant he can keep the boys away from town and the allurements that are always sure to be where people congregate together. I think that a man can make farming pay if he attends to his business and keeps up with his work; moreover, he will have time to spare to read good papers and learn what is going on outside of his own neighborhood.

Three Rivers. S. M. S.

I AM a farmer because I love a farm life. Every tree, flower or blade of grass that the all-wise Father has made is dear to my heart. Another thing—what work can a woman do that will pay her as well? She can plant potatoes, raise cabbages and onions, cultivate fruits, take care of the chickens, make butter and can really do as well as a man if she wants to; for she can have a hired man, the same as the man farmer does. He does not do all the farm work. There is one thing I will never raise—that is tobacco. H. A. H.

Carpenter.

FROM OHIO.

WHAT am I farming for?

1. Because I like farming better than any other business.

2. Because it is a very profitable business if pursued with the intelligence and diligence necessary to success in any other vocation. There is no money in growing the average crops of the country. I do not believe half of the farmers take an agricultural paper. In all other kinds of business it is necessary to keep well posted, and farmers will surely get left if they don't get out of the old ruts. The world moves. J. W.

Lodi.

WHY do I farm? Circumstances favored my starting in business on a good farm, and notwithstanding the feeling I may have had to the contrary, as well as the anxiety of my friends, I am still here. I might make more money at something else; but I don't propose to experiment to find out. When a man has an opportunity to provide well for his family, with a little surplus to lay by and contribute to the wants of those around him, he is, in my estimation, in a most desirable position to let well enough alone. W. L. A.

Flushing.

HERE are some of the reasons that influence me in following the vocation of a farmer: Born and reared on a farm, the most pleasurable memories of boyhood and early manhood cluster around it. Blessed beyond most boys in a father who always kept faith with me, who never refused a reasonable request, and who never forgot that he was once a boy, I led a happy and contented life, though a busy one, and learned to love it with a love that will doubtless last as long as life is spared. Under such conditions I grew to be a farmer as naturally as I grew to manhood: and knowing it best and liking it best I have never entertained serious thoughts of any other vocation. An ardent lover of Nature, what is more natural than that I should choose an occupation in which I became a coworker with her and in which success largely results from understanding and complying with her laws and in an intelligent study of her secrets.

An enthusiastic lover of field sports, the farm affords opportunity and leisure days for recreation with rod and gun. And on a farm, other things being equal, the home attains its highest perfection, a strong argument in the eyes of a man to whom home life is everything. The farmer's independence is proverbial and his opportunities for mental and moral culture are ample. If illiterate at the present day, he is so from choice not from necessity. And his table is always supplied with fresh, wholesome food. He need not be imposed upon with diseased meat or stale fruit and vegetables. Very few dwellers in large towns and cities know how a strawberry tastes fresh from the vines; and can never know the pleasure of plucking and eating fruit from vines and trees that their own hands have planted: Nothing, too, would tempt me to peril the future of my boy by exposing him to the temptations and artificiality of the city. On the farm I shall expect with a fair prospect of the fulfillment of my expectation, to see his young life expand and develop in harmony with his surroundings—trees, birds, flowers, and all that is lovely in nature.

The RURAL is doing a grand work in educating the farmers to a point where they will understand their capabilities and appreciate their opportunities. G. W. B.

Indiana.

FROM INDIANA.

I FOLLOW farming because I like the business; I think I am better qualified to farm than to do anything else. I believe the farm the best place on earth to raise a family: the fact that the little ones come in contact with the rough corners of farm life and notice the development of plants and animal life as they grow up, develops in them better characters and stronger minds. W. M.

Bassett.

FROM WASHINGTON.

I FARM because I can always have work, usually at good wages, and I am my own employer. Farming is a safe and sure business, and our living profits seem to come more directly from the hand of Him who gives us "rain and fruitful season." I once tried for two years working out to make money faster. Farming pays better. A few days' fruitless search for work at one time and dismissal from one job because I had mistaken my orders gave me a taste of the trials of those who depend on other men's pleasure for their living and confirmed me in choosing the peaceful happy life of a farmer. D. N.

Oakville.

FROM MISSOURI.

I FARM for a living and to make money. I have so far done both by raising mixed crops—corn, wheat, potatoes, cabbage, tobacco and garden truck, with plenty of hay.

Berwick. J. G.

FROM MINNESOTA.

WHAT am I farming for? This is truly a most important question. If a man has no definite, well defined motive in view he should at once quit the field and give place to some one who has. No one can hope to attain success in any vocation in life unless his heart is in his work. If his work is degrading, the sooner his interest in it abates, and he is induced to seek for more ennobling and elevating employment, the better. Farming is an

ennobling and instructive calling. Nature blooms in sweet profusion all around the farm, stimulates the imagination to lofty hights, to study the sublime as spread in rich and abundant profusion in the pastures verdant with the sweet and luxurious grasses, for the sustenance of the animals most useful to man. Then what a delight there is in seeing that these are properly cared for; that the most profitable returns are made from stock that labor, as well as from those that give milk or butter, cheese or meat or clothing.

"Again what are you farming for?' For the profit which comes from well directed labor, intelligently employed; for the health and strength, activity and usefulness the employment gives; to be better able to meet the great

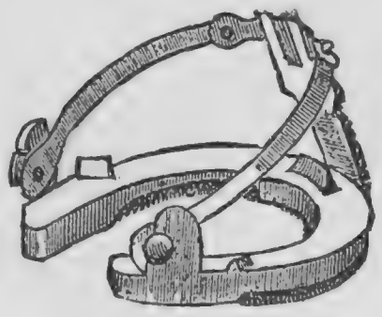

Fig. 173.

responsibilities of life that rush in upon us every hour; to be lifted higher in the sphere of exalted thought and noble aspirations, the true dignity of true manhood. How can it be that he who is so intimate with Nature, should fail to profit by the wonderful lessons she teaches, in "hill, and vale, and stream?" Certainly he who fails to do this cannot love her; most surely his heart is disinclined to listen to the music of her voice. Little wonder that he groans: "Farmin' don't pay." Nature is a generous giver when she is loved and petted, but poverty punishes a slight to her. These are some of the many answers I would give to the question for A. D. 1889.

Goodhue County. W. E. R.

I AM a farmer from choice. When a boy I had much to do with horses, as my father kept a livery stable. It was always a pleasure to get out into the country, and I thought at that time that I would some day be a farmer. At 20 I went into a dry-goods store, where I remained four years as a clerk. Then I went on a farm and I've been farming ever since. I have no idea that I would have enjoyed life so well in any other business. It gives me more pleasure to make two blades of grass grow where only one grew before, than it does to make a trade by which I gain money.

Wright County. J. L.

FROM NEBRASKA.

WHY am I a farmer? Well, because I wanted to be—not because I had to be. I was raised on a farm and staid there until 19, then followed railroading for two and one-half years and was doing well when I quit to take a homestead, and here I have been for nearly 20 years. I took a piece of raw prairie; now I have thousands of trees, including about all kinds of fruit trees that will grow in this climate, also a fine collection of evergreens, the poorest of which I think is the Norway spruce. The best I have is the Austrian pine. I like it better than the Scotch pine. I have no White pine. I may also say that I am a

Fig. 174.

farmer because I like to be my own boss and no one is trying to beat me out of my job—as there always is on a railroad. For my love of the farm I can thank the RURAL in part at least, for I have had the reading of it since my boyhood days. Success to it! May its coming days be still better than the past!

Steele City. D. T. G.

FROM PENNSYLVANIA.

THE RURAL wants to know why farmers farm. I follow the business because I like it; because I think it as profitable as most other occupations, if we apply to it the same business principles and the same judgment; because the farm is a good place to raise a family of boys or girls. If the boys make good farmers they are qualified for any other business which requires pluck and perseverance, and one reason why I farm is because of the farmer's independence of the opinions of others, as he is not dependent for his success upon the patronage of his neighbors. I am not a city farmer, as I have lived on a farm nearly all my life. I. R.

Poughkenamon.

I BECAME a farmer, not because I had to, as the head of the house or home was an artisan and worked at his trade. We wanted a home where we could do as we wished, which we had found impossible in a rented house. The children were too noisy; the cat was a nuisance; our neighbors' chickens destroyed our garden when we had any. We had to buy every pint of milk, every dozen eggs, every bushel of potatoes, every cabbage, etc., and could not always get them, or, when we did, perhaps they would not be fresh, so we bought a small farm of 37 acres so that we could have a cow, pig, some chickens, etc., and plenty of water without having to carry it so far. Now after living here a few years, we have learned to love the freedom of the farm and find by devoting to it as much time as we would to any other trade, that there is money in it. Of course I do not say that anyone can, all at once, become rich in farming, but he can enjoy better health and comfort, and more luxuries than the ordinary tradesman or mechanic can. Then there is the freedom from rent, a great bugbear to the man who falls sick or who finds work slack. If a farmer with a family were to leave his farm and take a place at a trade and get $12 per week, he would wonder where his money went to if he had to buy the same things he had without price on the farm. M. L.

White Mills.

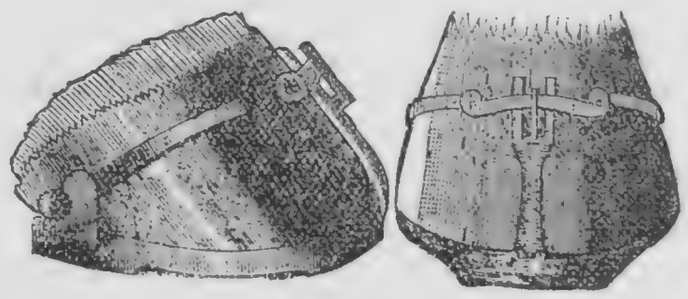

Fig. 172.

WHAT are we farming for? Mainly for good health and pure enjoyment. The more of our own food we produce, the more certain we are of its purity and wholesomeness. With good, pure food, good health and home attractions, the purer are our enjoyments. Farming is a success for us. But we are also farming to produce a basis for speculative gambling operations. C. W. G.

Waynesboro.

BARN-YARD MEMORIES.

READERS of the R. N.-Y. will remember a picture, printed last fall, entitled "A Tale of a Tail," which illustrated the misfortunes of a man who tied the tail of the cow he was milking to the strap of his boot. We cannot think of any of our pictures that has called forth more pleasant comment than this "Tale." It seems as if half of our readers have seen "some other fellow" in just about the plight of the milker in the picture; and those who have not met with a similar case have some other barn-yard experience to relate that they consider just as laughable. Among the many barn-yard tragedies that have been submitted to us are the following. Our artist has illustrated them on the first page. We let the historians give their own words:

A KICKING COW.

DR. W. J. BEAL.

"THAT reminds me;" I mean the cartoon on the milking of a cow. Possibly the following may be a pointer for another cartoon: For kicking cows I never succeeded in finding a suitable remedy. I have made many experiments, but never succeeded to my satisfaction. Since I quit milking, perhaps better races of cows have come into existence. When a lad, I used to take up one fore foot and slip on a strap to hold it up, letting the cow stand on three legs; but a smart kicker even then would always beat me. I tried a bar pressed close up to one side of the cow in the stable, with partial success. I have since heard that a rope or strap tied tightly around the body in front of the hips is a sure thing. I never tried it, but I have tried moral suasion, scolding, talking gently, whistling, pounding with milking stools, pitch-forks, using big whips—all to no purpose. A good kicker was sure to worst me when I least suspected it.

Toward the last of my checkered career as a milker, after having tried many experiments, having read all I could find and sought the advice of every one; after frequent trials and spilt milk and soiled clothes; after shedding many tears and losing my good disposition (all true); after giving much serious thought to the subject, I hit upon the following original device, which seemed to be a good thing. I tried it at the next milking, when no one was near to notice success or failure. I tied a slipping noose about the right hind foot of the cow and the other end of the rope to a gate post, and started up the cow till the rope was straight. She could not get away, she was properly "histed," and could not get her foot into the pail. I sat down to milk. It was "Old Brock," our worst and most experienced kicker. I milked her for once with great satisfaction, and was delighted with my new plan. I talked to her in triumph and set the pail of milk through the gate. I induced her to back up so as to slacken the rope, and sat down to untie it. She stood quietly until the rope was freed. I was stooping right behind her. She looked around to take in the situation, struck me a smart blow on my forehead, and started on a run, while I rolled over in the dirt and saw a firmament of golden stars. I did not pursue the cow. She was still the victor, as she always had been. I wore a large lump for the next three weeks. I never tried the remedy again, nor did I milk the cow when I could possibly induce the hired man to do so.

Agricultural College, Mich.

CALLING THE STEER.

E. J. MCWAIN.

THE RURAL'S pictorial illustration of a "Tale of a Tail" reminds me of a laughable incident or barn-yard scene which was enacted in my presence in old Vermont before I came to this country. I was living at home on a farm with father, and one of our neighbors, a Deacon of the village Congregational church, about 60 years old and weighing 250 pounds, an excellent man but somewhat noted for his eccentricity, superintended but did little else upon his farm, as he had grown-up sons who performed the labor. His farm team was always a yoke of oxen. His barn-yard was quite large and, like all such yards in that country during the spring work, was probably a foot or more deep with slush or a mixture of snow, mud, manure and black, filthy water, making a conglomerate somewhat of the consistency of porridge, with an occasional knoll and the smooth round surface of a stone affording a precarious footing in passing over it. While the yard was in this condition one spring day, the oxen were chewing their cuds lazily in different corners. Having occasion to yoke them up, one of the boys accompanied by his rotund father went to the barn for that purpose. The young man took the yoke and went to the off ox and put the end of the yoke on him, and taking out the other bow, and holding it in his right hand, and elevating the other end of the yoke with the other, was loudly calling to the other ox to come under the yoke, but he continued to chew his cud without noticing the order. The old gentleman made his way as best he could towards the ox on these knolls and stones, until he stood some 20 feet from him, with both feet on the rounding, smooth surface of a stone. He could advance no further without stepping into the slush up to his knees. There he stood, waving his hands in the air, and hallooing at the ox to drive him under the yoke. While in this attitude his feet slipped from the stone and he fell heavily forward at full length, face downward, into the mud and slush. He deliberately rolled over on to his back and as deliberately proceeded to rise. Having regained his feet, standing to his knees in filth, which was dripping from his besmeared face, spit from his disgusted mouth and running off his garments and the tips of his fingers, he looked up to his son and quietly remarked: "Well, I find it is easier to fall down and run the risk of getting hurt than to exert myself to stand up." Being short in stature, and somewhat wheezy, the whole scene, though unfortunate, must have been a source of no small merriment to the most lugubrious. But to be fully appreciated it ought to be seen. No description could do it justice.

Falls City, Nebraska.

I AM VERY MUCH INTERESTED in the RURAL'S Rosa rugosa hybrids, and want to know all I can about them. Last Christmas I sent to Thos. S Wan, London, and got several of the new Rugosa sorts—Paul's single white, Paul's single red, and two others. They have made a great growth. C. H. S.

Niles, Cal.

Farm Economy.

NEW AGRICULTURAL DEVICES.

THE Paris Exposition has drawn together many new machines and devices that promise

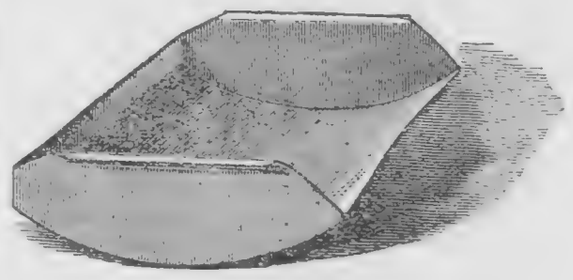

Fig. 175.

to be of service to farmers. Our English contemporary, the Mark Lane Express, prints pictures of some of these devices, which we have re-engraved.

THE NAIL-LESS HORSE SHOE.

This invention is shown at Figs. 172 and 173, and the pictures fully explain the contrivance. It is said that these shoes are in use in London to a considerable extent. Those who use them seem to think that a horse is rested by having his shoes removed when not at work, just as a man would be.

THE SPEEDWELL CREAM RAISER.

This invention is shown at Figs. 174 and 175. Fig. 174 shows the vessel into which the milk to be creamed is poured. A is a glass eye-piece to measure the amount of cream; B is an outlet pipe for drawing off milk; C, C, C, C are compartments to assist in the rapid cooling of the milk, and R is the upper portion of the creamer, just large enough to admit the skimmer, Fig. 175. To use the contrivance, the milk is poured into the vessel, which is filled nearly to the top. The legs, C, C, C are placed in cold water so that all the cream rises to the top of R. When the cream is ready for skimming, the skimmer, Fig. 175, is passed through R at a depth indicated through the glass, A, and the cream is thus easily removed. One defect that users will find in this is the fact that the small compartments at C, C, C, C, while valuable in promoting rapid cooling, will be difficult to clean properly.

Farm Topics.

NEW JERSEY FARMS THAT PAY.

EDITORIAL CORRESPONDENCE.

NO. II.

R. N.-Y.—Can you give me a statement of the sales from your 100-acre farm in one year?

FARMER L.—Here is an account of my sales from the farm for 1888—1889, closing with April 1, 1889:

From cattle and pork	362.16
Corn	130.00
Potatoes	1,304.16
Hay	925.00
Wheat	331.32
Miscellaneous sources	64.19
	$3,116.83

R. N.-Y.—But your soil is unusually strong.

FARMER L.—It was not so when I bought it. I can easily raise double the crops I could 10 years ago, and chemical fertilizers have done the work for me. I would like to see an acre of farm land in New Jersey so poor that I cannot, by the aid of fertilizers, make it yield paying crops of potatoes and hay.

R. N.-Y.—When shall you be satisfied with the condition of your farm?

FARMER L.—When the soil is so uniformly strong that I can, whenever I wish, put it all into grain and grass with the certainty of averaging over two tons of hay per acre. Soil that will do that is good enough.

R. N.-Y.—Have you ever tried low-grade fertilizers or special manures containing one or two fertilizing elements?

FARMER L.—Yes, and my experience teaches me that it is economy to buy the highest grade of a complete fertilizer that I can get. I do not see why potash, phosphoric acid and nitrogen may not have intrinsic values as fixed and permanent as the intrinsic value of flour, sugar or clothing. Staple articles of food that go to sustain life have a fixed value, depending upon the cost of production, handling and transportation. Cheap sugar sells for less per pound than good sugar, but you have to use more of it. The "sweetness" costs as much in one grade as in the other, and the cost of hauling and handling the cheap grade is the same as that for the higher grade. The same elements that go to make first-class Timothy hay are used in forming trees, logs, lumber. Sawdust, then, should make as good a feed as the hay. But what will a horse say to this? The proposition is ridiculous; and yet, is it not as sensible as that made by a man who says that a $25 fertilizer is just as good as one costing $40, because one contains almost as much phosphoric acid, potash, and nitrogen as the other? A man can make a cheap fertilizer by using leather and South Carolina rock that might analyze well. Another man might use nitrate of soda and bone, that wouldn't analyze much better, and charge twice as much for it, and yet his fertilizer would be far cheaper than the other. The cheap fertilizer would represent to the plant what the sawdust would to the horse. No, sir; in my opinion it is economy to use a high-grade fertilizer every time, and on my farm I doubt if I can use too much of it.

R. N.-Y.—Do you fear Western competition?

FARMER L.—No. It has driven us out of the cattle business, but fertilizers have given us an advantage over the West. Within 60 miles of us are some 4,000,000 people that must be fed. It is a pity if we can't find some article of food that we can beat the West at producing. Hay and potatoes are our great money crops. Croakers tell us that electricity will, sooner or later, so supplant horse power in the city that the demand for hay will fall off. The thing to do in that case is to use every means to improve the quality of the product. The greater the supply, the better the sale for the part of it that can be graded "No. 1." We have a soil and climate here admirably adapted to the production of potatoes and hay, and we can put just as much brains and business into these crops as anybody in any other part of the country.

R. N.-Y.—Is there any reason why farmers' boys should leave such farming as this?

FARMER L.—It would seem not from the way our best boys stay. Farming with fertilizers is a science that calls for the best thought and study a man is capable of. Any young man who studies such farming fits himself for a profession that will enable him to earn a good salary. Thousands of city men are buying large farms. They cannot run these farms themselves, but they are ready to supply ample capital and pay good salaries to the right men who will serve as managers. Here are good chances for capable farmers' boys. The graduates of our agricultural colleges ought to fill more of these positions. They might make by filling them more than two-thirds of the young doctors or lawyers ever will make.

R. N.-Y.—What is the size of your farm?

FARMER S.—I have 132 acres.

R. N.-Y.—What is your rotation and how do you use fertilizers?

FARMER S.—Mine is a five years' rotation as follows: 1. Potatoes, using 1,500 pounds of potato fertilizer per acre. 2. Wheat, with 400 pounds of the same fertilizer per acre. 3 and 4. Grass—no manure. 5. Corn with all the farm manure I have, with a little fertilizer in each hill to stimulate an early growth. If I have not enough farm manure I use complete corn fertilizer, which is applied with the grain drill. This acts also as a harrow, and dispenses with further harrowing. In fact, the harrow with us is a little-used implement as compared with its use in some other sections.

R. N.-Y.—So I have noticed. I have seen very few of the newer harrows about here. But how do your crops compare, under this system, with former ones?

FARMER S.—I consider that all crops, grain, grass, wheat and potatoes have doubled. When I started the large use of fertilizers, my father, an old man, did not think it would pay. He thought we were putting too much cash into the ground. The old plan of using fertilizers was to put on as little as possible—that is, to apply just as much as a single crop could use and no more. The idea was that fertilizers were much safer in the barn than in the soil, and that what was left by the crop was generally washed out and wasted. So 400 or 500 pounds per acre were all they dared to use. My father could not see where the money spent for 1,500 pounds would come back. He lived long enough, however, to see enough of an increase in the crops to convince him that the heavy fertilizing pays. We believe that the only way to make fertilizers pay is to use lots of them. I do not know of a single farmer who has worked up to 1,500 pounds that would go back to a smaller quantity.

R. N.-Y.—How much stock do you keep?

FARMER S.—My working teams and three cows. Last winter I fed some steers, but such feeding does not pay. I want some way of using up my corn-stalks.

R. N.-Y.—Some farmers at the East buy farrow cows in the fall, milk them through the winter, making butter, and sell them for beef in the spring.

FARMER S.—I would like to try that. I think it might answer here.

R. N.-Y.—Are most of the farmers prosperous about here?

FARMER S.—Generally so. I presume we have as small a proportion of farm failures as country neighborhoods usually show. I want you to go and see Farmer D. He has what I call a model farm. He has 100 acres of land. He bought it 20 years ago and paid from $175 to $200 per acre for it. It would not sell for much over half that now. He has never done anything but farm, yet he has paid for his land, bought another farm and has now money enough to buy another. He is a steady, industrious, careful man. He never left the farm to run about and try to be elected to some little township or county office, but he has kept at home, worked hard, watched every point, and as a consequence, succeeded.

R. N.-Y.—A man that will work that way will succeed in any kind of work won't he?

FARMER S.—It looks so. There is no other way to success that I know of.

R. N.-Y.—How much stock do you keep, Farmer D?

FARMER D.—Three horses, two mules and 10 head of cattle. I have 100 acres of land, which cost me from $175 to $200 per acre.

R. N.-Y.—How long have you used high-grade commercial fertilizers?

FARMER D.—Only five years. This year I bought 10 tons. I use 1,500 pounds per acre on potatoes. My wife sometimes complains about the amount of cash I spend on fertilizers; but my experience is that the more I spend in this way, the more money proportionately I get back. Last year I sold $1,100 worth of hay. If you want to see what fertilizers have done for my hay crop, notice the farms on either side of me as you drive past them. They are run on the old plan and will not average over one ton per acre. I have laid aside in one year, $1,900 from my farm. That was a year of extra good prices and crops. Still, in that year I paid for all my help; now I have three sons large enough to help me. One of my sons, just married, has taken a farm just across the road. It is on poor soil, but he is bringing it up with our usual crops, only using rye in the place of wheat.

R. N.-Y.—Does your rotation differ from that of other farmers about here?

FARMER D.—No. We have about the same plans. We raise corn, potatoes, wheat and grass, put our farm manure on the corn crop and our fertilizer on the potatoes and thus manage to keep work going all through the season. When the land is plowed in the spring we plant potatoes; then comes corn planting; by the time the potatoes are cultivated the corn is ready to work in; when the potatoes are sprinkled it is time for haying; then come harvest and thrashing; then we are ready to dig potatoes; then come corn cutting, and after that wheat seeding.

R. N.-Y.—You make farming pay then?

FARMER D.—Well, it seems so. The fact is that our farms are assessed for the same amount, whether we use 400 or 1,500 pounds of fertilizer. If by using 1,500 pounds we can double our crops, it is pretty good business policy to do so, we think.

The R. N.-Y. talked with many other farmers and looked at the growing crops on several farms. The answers given above are typical; enough of them have been given to show the way the best farmers around Cranbury are conducting their business. Let it be remembered that the R. N.-Y. merely acts as a reporter. This is not a special plea in favor of large dressings of high-grade fertilizers. We merely state exactly what we saw and heard. Any farmer can go and see for himself what these farms around Cranbury are doing, how they are improving and how chemical fertilizers are actually taking the place of stable manure.

The Cranbury farmers are emphatic in saying that their prosperity is due to the use of commercial fertilizers in large quantities on potatoes. The R. N.-Y. saw no evidence to controvert this claim. The fact remains, however, that only a skilled farmer can afford to farm on a 1,500-pound scale. The man who is not willing and able to exercise the keenest powers of his mind in the handling and selling of a first-class product should never try to run his farm to its fullest capacity. These fertilizer farmers at Cranbury are students. There was an agricultural report in every room that we entered and all the volumes had evidently been read and reread.

These farmers seem to be solid men in their community. They could well afford to use fertilizers. Most of them seemed to have some capital to work on so that the expenditure of large amounts of cash for the fertilizer would not cripple them. Farmer D's experience is exceptional. He seems to have started with less money than any of the others, yet now seems to be making as much profit as any. The R. N.-Y. knows of hundreds of discouraged, debt-burdened farmers who toil year after year on land that grows poorer and poorer. It is impossible for any intelligent man to fail to see, after a visit to these Cranbury farms, that these poor lands can be restored to fertility and the hard life made easier. But how are these discouraged farmers to begin? That is the question that suggests itself at once.

There is little place for pastures in the Cranbury system of farming. The design is to have every inch of land under some paying crop. Hence there is a constant inclination to decrease the amount of stock. But for this sheep would doubtless pay well, as consumers of corn-stalks. Most of the farmers keep so little stock that fences ought to come down and the long lanes that run through most farms be reduced to a space wide enough for a wagon road.

To sum the matter up, the R. N.-Y. is led to conclude that some farms at the East are actually increasing in fertility by the use of fertilizers, that it will be many years before these Cranbury farms become a part of the "desert" prophesied by our Western friends, and that few farms in the West growing the same products pay better profits or maintain their fertility so perfectly. This is all we can say. Are the plans pursued at Cranbury suitable for general adoption in other Eastern neighborhoods? That is something you must think out for yourself.

Everywhere.

RURAL SPECIAL REPORTS.

Iowa.

DES MOINES, Polk County, June 24.—June has been wet and cold. There have been very few days of good growing weather for crops. Corn is small and many fields are green with grass and vines. Unless warm weather comes soon and lasts late, our prospect for a full or average corn crop will be slim. The weather has been favorable for a heavy growth of small grains and grass. Our grass is fine, and there is a good prospect for a good crop of hay. Oats are falling badly and will be greatly damaged. Our rains have been attended of late with hard driving winds, and lands are badly washed. We have the promise of a large crop of potatoes. Cabbages, onions, beets and peas are doing well, and are in great supply. But it is impossible to get a vine of any kind to grow. The striped cucumber bug was never so bad, and defies all remedies. We have two new insects here: one is the strawberry worm, which makes its appearance early in the spring, and is a greedy feeder on the foliage, and unless the pests are, or can be, destroyed, it is useless to plant strawberries. The other is the squash grub. It seems that it is hatched from an egg laid on the stem of the vine, near the ground, and eats its way into the vine, and soon destroys it. The pests were very bad here last season. F. S. W.

North Carolina.

S. WASHINGTON P. O., Pender Co., June 25.—Corn, peas, potatoes and stock are in good cultivation. Almost all farmers are through with laying by their crops, which are the best for past three years. We have had few rains and a season good for all crops. Our fruits are almost ripe. Large quantities of Orange cane have been planted and it is looking fine. Most families have enough to make a year's supply of sirup. No dairying is done here, although we have fine natural pasture. Our cattle are almost all scrub stock. I have Devon cattle, Berkshire swine and Cotswold sheep. D. J. M.

New Hampshire.

DOVER, Stafford County, June 26.—We have had a hard season thus far. On the morning of May 27 the mercury stood at 32°. Ice made over an eighth of an inch thick, and frost did much damage. Since that time the mercury has been at 40° two or three times, and more or less rain has fallen nearly every day. We have had heavy thunder showers, and the lightning has done a good deal of damage. Grass is looking well and there will be a pretty good hay crop, but haying is not coming on as early as was expected on account of having so much cold weather. A few have begun on pieces that were lodged, and if the weather is good the first of next week a good deal of grass will be cut. W. E. R.

ANSWERS TO CORRESPONDENTS

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

PROTECTING PASTURING CATTLE FROM FLIES.

D. A. C., Sandwich, Mass.—Are there any practical means by which cattle in the pasture can be protected from the attacks of flies, etc.?

ANS.—Here are replies from a number of good dairymen. The R. N.-Y. can add little to the list of remedies. Who can?

FROM C. M. WINSLOW.

I never tried anything. It would be quite expensive to wash a large herd over every day or two with any wash.

Brandon, Vt.

FROM L. F. ALLEN.

I have never succeeded in putting any wash or substance on cattle to prevent flies from disturbing them in pastures. Every part of the animal cannot well be washed or anointed by any preparation, and all exposed parts will be accessible to flies. At milking times during the fly season cows should be in dark stables, where flies will not trouble them. That has been my practice for many years, and it has always been effective.

Buffalo, N. Y.

FROM W. M. BENNINGER.

The best plan I find for keeping flies off cows is to pasture the cows at night, and keep them in a cool stable in the day time, and have good fly doors on the stable. I find some put fly covers on their cows. I pasture mine early in the morning and late in the evening, and keep them in a brushy swamp during the day, where they have plenty of fresh water and shade.

Walnutport, Pa.

FROM G. W. DREW.

Little experience have I had in this matter. I have seen blankets made of cotton cloth used with fair results; also a liquid made by boiling walnut leaves, moistening the coats of the cows occasionally with it.

New Haven County, Conn.

FROM W. E. RINES.

The only thing I have tried is burdock leaves steeped in water until the liquid is very strong. Three years ago next August one of my cows slit a teat open when she was giving 15 quarts of milk per day. I sewed it up and kept her in the barn a month. Of course, there was more or less milk on the floor. I used the burdock water and it kept the flies away.

Stafford County, N. H.

FROM SMITHS, POWELL & LAMB.

We have never had occasion to protect our cattle from flies, having at several points on our farm growing timber in which the cattle rest at pleasure. In the Adirondack region where the "black flies" are troublesome we have known of parties putting on their cattle a preparation made of tar oil or tar and lard, which, if applied frequently to the ears, will, to some extent, keep the flies away, but it would never be practical for a large herd.

Syracuse, N. Y.

FROM J. W. INGRAM.

I have never tried anything to prevent cows from being annoyed by flies when running in pasture. I have seen it stated that sponging

the bodies of horses and cattle with a strong tea made by steeping red peppers in hot water would prevent flies from biting the animals when in pasture, but I have no personal knowledge on the subject.

Bradford County, Pa.

FROM W. B. PRATT.

A wash of a decoction of hickory leaves, also tar water scented, have been used, but without such results as to encourage a repetition very much. Efforts of the kind have finally ended in an abandonment of the animal to such protection as could be gained from shade trees and its own switch, with a feeling of unavailing pity for it.

Steuben County, N. Y.

FROM M. MORSE.

I know of no practical means of protecting animals at pasture from being attacked by flies. I have heard of several washes, among which is a decoction of walnut leaves, and of pyrethrum, but in my experience they proved worthless when tried on horses.

Norfolk County, Mass.

FROM PROF. A. J. COOK.

I know of no practicable way to keep the Ox Bot fly from laying eggs upon our cattle, except to keep the cattle in the barn, as I suggest in my little pamphlet on "Silo and Silage." It is wise economy to stable our cattle and feed silage in summer. Pasturing is very expensive. By feeding silage, an acre will keep a cow for a year. Then the gad-flies will do no harm. If it is not thought wise to do this, the next best thing is to cut the trees from the pasture. Cattle pastured on wood lots or where there is much shade are far more liable to attacks from the gad-fly than those in open pasture fields. The presence of gad-flies is not very harmful unless the cattle are to be slaughtered, when the pelts are of much less value in case the warbles are thick under the skin. The best course then is, to keep the stock in yard or barn, the next best thing is to keep them in open, unshaded pastures in July and August.

HOW TO BUILD A BRICK CHIMNEY.

W. M., Pittsford, N. Y.—How should a brick chimney 30 feet high be built to have the best possible draught?

ANS.—If this refers to the chimney of a dwelling-house it may be replied simply that it should have a flue not smaller than eight inches square for each separate fire; the flues should be straight, or, if necessary to pass out of a direct, upward course, the deviation should be as small as possible. The flues should be made of the best hard brick; no soft brick should be used and the flue should be plastered smoothly all over the surface as it is carried up so as to leave an even surface without roughness or projections to impede the draft, cause irregular currents of air or gather soot.

If the chimney has fire-places connected with it, these should have a contracted throat made in this form:

Fig. 176.

There will be no downward currents caused by reflux of air in a chimney built in this way. If it refers to a single chimney as for a furnace or a boiler, the chimney should taper outside gradually to the top, but the flue should widen a little as it goes up, not more than three inches, however, in 30 feet. This enables the cold air which rushes in above the fire to expand as it gets heated and makes a stronger draft below, which, of course, in all chimneys, is a great advantage. The plastering of the flue in every chimney is indispensable, and to prevent the plaster from cracking with the heat, cow dung is usually mixed with it and it is well tempered before it is used.

KEEPING CELERY IN WINTER.

A. C. J., Cuba, N. Y.—I want to excavate a space 16 feet long, six feet wide and 2½ feet deep for a celery bed or trench, and wall it up with brick or stone and cover with plank, straw, etc., during cold weather. Will it keep the celery without rotting and will it need ventilation during warm weather? I can't preserve celery in a trench with any satisfaction, and it is not crisp and nice when blanched.

ANS.—In order to keep celery well during winter it must be kept in a cool temperature, say, 35 degrees to 38 degrees, dry overhead and only slightly moist at the root. Where a large quantity is stored together ventilation is necessary. Crisp and nice celery depends a good deal upon the variety grown and the cultural conditions before storing. After storing, dryness wilts it, wet rots it, warmth sprouts and "draws" it and robs it of flavor. Celery stored when green will keep for months without bleaching crisp; but celery that is half-bleached before storing, will soon attain perfection after being stored; and the red celeries are better flavored than any white celeries. The pit you propose to excavate and build should do very well; but be particular about having the drainage thorough and that no water can leak through the top; also provide means of ventilating. But in getting up such a substantial pit, why not widen it by two feet more, and shorten the length in proportion? Then raise the side walls two feet above ground level and bank up against them with dirt, and cover all over with a secure span-roof. Then you could have a narrow passage in the middle to walk in, and a celery bed on each side, and you could go in and out there in winter whenever you felt inclined to.

POISONING BEES.

Several subscribers.—We hear from various sources that the practice of spraying orchard trees with the Paris-green solution has resulted in wholesale poisoning of bees. What is the truth of the matter?

ANS.—Prof. A. J. Cook, of Michigan, writes the following in answer to our inquirers:

It is a compliment to our civilization that until the present season no reports have come of injury to bees through the use of the arsenites in spraying for the codling moth. True, I have urged caution each season for the last 10 years; but some people are both heedless and careless. And the wonder is that all have acted so wisely. We now have reports from Illinois and Michigan, of serious loss from not heeding this advice. Let it be understood by all, that *trees should never be sprayed* with London-purple or Paris-green until the blossoms have all fallen off; otherwise the nectar will be poisoned and the bees in collecting this will suffer death, and in conveying it to their hives may poison the honey. Neglect of this caution is the more inexcusable as it is best even for the destruction of the codling larvæ to wait till the blossoms fall; else a rain may wash all off before any good is done. It is to be hoped that all the RURAL'S exchanges will publish this article, so that the people before another spring, may all know of the danger and wrong likely to follow neglect to heed this suggestion. It is desirable that all legislatures should legislate on this question. A heavy fine consequent upon such practice would be a good teacher, and make apt learners. Every effort should be made that our fruit growers may know of the danger and wrong of too early spraying.

SMUT IN WHEAT.

E. S., Sorgho, Ky.—What is the cause of smut in wheat? Is it due to an insect? Is there a preventive?

ANSWERED BY B. P. GALLOWAY, CHIEF OF SECTION OF VEGETABLE PATHOLOGY, DEPARTMENT OF AGRICULTURE.

This disease is not due to the work of insects, as you suppose, but is caused by the growth of a minute parasitic plant or fungus through the tissues of the wheat stalk. The dark-colored, ill-smelling powder is made up of innumerable spores or reproductive bodies, each of which is capable of infecting a healthy wheat plant, if it can come in contact with it under the proper conditions. The only time when infection is possible is when the plant is young, and to guard against this the spores on the seed wheat must be destroyed before the latter is sown. This may be accomplished by treating the seed by either of the following methods: 1. Soak the grain in a one-half per cent. solution of blue-stone for 16 hours, then pour off the liquid, dry the grain and sow immediately. 2. Dissolve 10 pounds of blue-stone in eight gallons of water, place the solution in a tub and pour the wheat into it, taking care not to put in enough to come to the top of the solution. Stir it well, skim off the floating kernels, pour off the solution, then drain and dry the wheat. It is not safe to leave the grain in the solution longer than 15 or 20 minutes.

INJURY TO DWARF LIMA BEANS.

W. C. A., Medfield, Mass.—One of my neighbors sent for a package of the Bush Lima beans, and planted them in his garden, a good, sandy loam. They all came up, but did not look bright and vigorous. Soon they began to disappear, and finally every plant went under ground. The accompanying specimen was taken up just after it disappeared. What is the explanation?

ANSWERED BY PETER HENDERSON.

I think there is no doubt that the injury is a consequence of the cold, wet season, which, of course, is very injurious to all tropical growth, and the Lima bean is one of the most tender of all the vegetable kingdom. There has been a great deal of complaint even with the ordinary Valentine and other kinds of kidney beans in Western New York; hundreds of acres of them have been injured, and in many cases they have had to plant again.

ANOTHER ANSWER.

My theory is that the common fish or angle-worm did the mischief, having come up to the surface in the wet weather and pulled the plant down, although I have not seen one at work.

HYBRID PERPETUAL ROSES, ETC.

J. M. M., Ontario, Canada.—1. Can the Clematis Jackmannii be propagated by layering? If so, when and how ought it to be done? 2. Name a few fine Hybrid Perpetual roses, which are particularly characterized by a hardy, vigorous constitution, and free flowering, whose flowers are "good," if not the very best? 3. If the plums in which the curculio has laid its eggs have been destroyed by frosts, can the pest be propagated in another way? 4. Name the best periodicals published in the United States devoted wholly, or in part, to Botany and Natural History; also the best illustrated work on American scenery.

ANS.—1. Yes. Layer it now and it can be cut from the parent stem next spring. 2. Gen. Jacqueminot, La Reine, Mabel Morrison, Jules Margottin, Abel Grand, Baron de Bonstettin, Anne de Diesbach, Baroness Rothschild, Caroline de Sansal, Boieldieu, Charles Margottin, Countess of Serenye, Francois Michelon. 3. No. 4. We do not know of any works of this kind.

THE ELM LEAF-CURL PLANT-LOUSE.

Toronto Subscriber (lost letter) incloses elm leaves infested with insects about which he asks several questions.

ANSWERED BY L. O. HOWARD, ACTING U. S. ENTOMOLOGIST.

ANS.—The insect is the common American Schizoneura or Elm Leaf-curl Plant-louse (Schizoneura Americana). It is too late in the season to attempt to do anything against this insect which will soon be taking wing and will disappear for the season. We do not know its hibernating habit, and the only remedy is to prune the first leaf curls when they appear in the spring. On account of its habits it is a very difficult insect to reach with any spraying mixtures.

ALSIKE IN DAKOTA.

L. E. H., Madison, Dakota.—Would Alsike do well in this latitude?

ANS.—Alsike clover is considered to be fully as hardy as Red clover, but not quite so able to resist drought. It has succeeded fairly well in several limited trials at the Iowa Agricultural College. We would not advise sowing it extensively in Dakota until its value there is better known.

Miscellaneous.

L. D., Greenwich, Conn.—Should the runners be kept off the strawberry plants while they are bearing fruit?

ANS.—Yes.

E. L. H., Helena, Arkansas.—Are there any particular tools made for caponizing fowls? If so, where can they be obtained?

ANS.—Yes, it is the hight of cruelty to attempt this operation without the use of special tools. W. H. Wigmore, Philadelphia, Pa., makes a good set.

"*Z.," Lawford, Pa.*—1. How should two-year-old rhubarb plants be treated so that they may bear a crop? 2. When should the stalks from roots set out this spring be used?

ANS.—1. If the plants are strong and the soil and cultivation good, two-year-old plants should yield a full crop. Pluck freely during April and May, remove the flower stems as soon as they show themselves, and stop plucking, except for an occasional dish, after the first of June. 2. Under good cultivation, next spring.

A. S. A., Pittsfield, Ill.—1. Will seedling peaches produce the same kinds from seed again. 2. Where can I buy one-year-old fruit trees true to name. 3. What does the RURAL think of the Durand strawberry. 4. Who was the originator of the Fay currant.

ANS.—1. A few kinds will often reproduce the variety from seed in all essential respects. But the R. N.-Y. is not aware that any variety can be trusted so to do. 2. The Storrs Harrison Co., of Painesville, Ohio, are the nearest to you of the trusty firms we recall at this moment. 3. It thrives in a few places and in rich soil. It is an exacting berry and will never be popular over a wide range of country. 4. A Mr. Fay. It was introduced by Geo. S. Josselyn of Fredonia, N. Y.

G. W. D., Birmingham, Conn.—Are Buhach and Persian Insect Powder the same? My druggist gave me the latter when I asked for the former, and there was no marked result from an application of it against rose-bugs. I used a heaping table-spoonful in two gallons of water and sprayed the vines every alternate day for ten days. Spraying my plum trees with London-purple, as the RURAL advised, worked like a charm. The trees are loaded with fruit and but few are stung.

ANS.—Buhach and Persian Insect Powder are both made from the same flowers, viz., pyrethrum. Buhach is the trade name for that manufactured in California. Our friend may be assured that if it had no effect upon the rose bugs, it was an inferior article.

DISCUSSION.

THE COLOR OF BUTTER.

HENRY STEWART, MACON COUNTY, N. C.—The inquiry recently suggested by the RURAL in an editorial note, has often occupied my thoughts and studies during several years past, and several examinations of cows after slaughtering, in regard to the source of the color of the butter, have been made. The results may be given as follows:

Cows vary in two ways in regard to this peculiarity: First, as to their natural function or structure which causes their fat, both in its separate disposition and its distribution through the tissues, to be of a higher color than that of other cows. For instance, the suet and other separately deposited fat of a Jersey or a Guernsey and of some few abnormal cows of other breeds, is more deeply yellow than that of other cows; the skin, which contains considerable fat, partakes of the same high color, and wherever fat is deposited in the tissues this color is perceptible. The butter of these cows partakes of the same coloring. Second, cows vary in their ability to extract the coloring matter thus deposited in the tissues, from the food. The assimilative capability of cows varies as is well known. Some cows will consume, digest, and assimilate greatly more food than others; and some will extract more of the fatty elements of the food than others. Food has an important result upon the quality of butter. This is well known to every practical dairyman, and it is undoubtedly due to a physiological fact known to physicians. The fats of food are not changed in the animal system as the other carbonydrates are. Starch and other soluble cellulose are changed into sugar before digestion, and any excess of the carbon not burned in the system to produce the natural heat indispensable to health, is either excreted as waste or is changed into fat by some natural chemical process of digestion or assimilation. But this does not happen with fat. The fat, existing in minute globules in vegetable tissue, is emulsified, first and partly by the saliva in the acts of mastication (and rumination) and lastly and completely by the mechanical action of the stomach and by the pancreatic fluid. The emulsion so formed contains the actual fat globules of the food as far as the cow is able to make use of them as nutriment, or extract them from the food. (And cows vary in this ability). The fat thus emulsified passes directly into the blood and is deposited from it in various parts of the body where it is wanted. A Jersey cow of large butter productio therefore has the fat of the food in intimate connection with the blood, and in its natural condition, color and other qualities unaltered. A recent proof given by the Washington Agricultural Department to the effect that butter from cows fed upon cotton-seed meal—a very oily food—contains so much of the unchanged oil as to approach closely in character to oleomargarine and might be classed as such, made from the oil of cotton seed by any chemical test, confirms what I have repeatedly stated from the results of my own experiments in the dairy.

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies.

The fat thus in the blood is deposited in the milk glands of the udder, each lobule of which has its nucleus of fat in the form of a globule in it. This fat has its natural color; but does it not in its separation with the other elements of the milk carry with it some of the coloring matter of the blood, and thus acquire a high yellow color, which is nothing more or less than a diluted red? I think it does for the following reasons: I had a pure Ayrshire heifer which coming in with her first calf gave milk as red as blood. The calf would not drink it.

To investigate this peculiarity I experimented with the milk. There were the peculiar red blood corpuscles in abundance in it, showing that the secretion of the milk had not been perfected, but that blood had exuded from the tissue of the udder instead of milk. The blood contained fat globules which separated in the form of a deep orange-colored cream, while the red matter settled to the bottom of the pans. The cream churned gave deep, reddish orange-colored butter of very good flavor, but so dark as to be useless. Another cow, a pure Jersey, which I used for experiment for five years consecutively, gave exceedingly high-colored colostrum on calving. This was set for cream and the cream churned. The butter was almost as deep a color as that from the Ayrshire cow. After calving it is well known that the circulation of a cow is much excited and the udder is gorged with blood, more or less in different cows no doubt. Here was an abnormal case in which the milk was blood and another in which it was milk, and the butter from each differed very little in the reddish-yellow color of it. This reddish-yellow color of Jersey and Guernsey butter from newly calved cows and when the circulation is abnormally excited, is a frequent peculiarity. Then, does not this color in such cases come from the blood, and is not the color coming with gradual y decreasing intensity always derived from the blood? If I am correct, this result explains why high color is allied with breed, or with special cows which possess distinctly peculiar functional properties, and is the reason why most of the Jersey and Guernsey cows (but not all of them) are able to yield not only the large quantity of butter from the same quantity and character of food, but to confer a special quality and color upon it.

This in no wise conflicts with the physiological fact referred to, for the disposition of the fats of the food in the way referred to is carried to excess in the largest butter-producing cows, and is developed to a less degree in other cows. One winter I fed red and yellow mangels in my dairy for some weeks, and sugar beets the rest of the winter season. The butter made during the mangel feeding was distinctly more highly colored than that made when feeding beets, and so much so that the artificial coloring used (to satisfy my customers) was somewhat increased during the feeding of the beets. The feeding has something to do with the color beyond question, as any one may find if he will change from good clover hay, corn meal and cotton-seed meal, to straw, buckwheat bran and wheat middlings. But even then some cows will make yellower butter than others on the same foods. The peculiarity then is, after all, through the blood or breed, and a functional characteristic of the cow.

FARM HELP.

O. H., GREELEY, COL.—The farm laborers in this section are of several nationalities, but mostly Americans from the Eastern States. We have Germans, Swedes and Danes; but more than one-half are American-born. Probably 10 per cent. ultimately farm for themselves. This section has no great industry except farming, hence it is hard for farm hands to live through the winter here. There are at this moment many men in Colorado who are unable to earn enough to pay their board. I think the number of cowboys employed on the range is steadily decreasing and the number of farms where stock is fed through the winter is increasing. Wages range from $25 to $35 per month and board found. Most of the help is hired about April 1. I have never known contracts to be made and signed. For my own part, I pay promptly, and if for any reason a man does not want to stay with me, I could not endure to have him. The necessary Sunday chores must be done in part at least by the hired men. That generally goes without saying. I once had a hand who had conscientious scruples about watering the horses or milking cows of a Sunday; but he did condescend to come down in his slippers and eat some of the breakfast which the women prepared. I had not thought to make any stipulation about the Sunday chores. I was about as much amused as provoked at this unprecedented turn of affairs; but did not retain him long. I observed later that this hand was not too good to break the moral law.

In this section men are generally treated like members of the family. This is not always fair to the family, as the presence of an outsider interferes with discipline, and prevents the free exercise of family tastes. On some of our farms the men have separate houses where they sit and sleep, and where they have a chance to do as they like. This seems to me fair all round; for I must say that, first and last, I have had great reason to feel dissatisfied with the habits, language and morals of many of my hands, and I can conceive that my reading aloud to my family cannot always be pleasing to the hired men who have to hear it if they sit with us. My own course in hiring men has been to hire high-priced hands. That is best for me. Five or even $10 a month are no great object as between a first-class and a poor hand.

Almost the politest man that ever darkened our doors was a Welshman, and he would not have been in Colorado except that his health failed. He never entered the room where he supposed we might be, without knocking. On the other hand, we have had modest young women whose training was so defective that they would bolt into private rooms that they must have known were such. I suppose that half the hired men I ever employed would open my bed-room door to speak to me, instead of knocking, if I were sick and in bed. Some of the best workers I have ever had have been the most unprofitable in the end. Twice or more they have become well acquainted with some branch of my business and taken it out of my hands. This has been done in a manner unfair, if not dishonest.

I have never employed more than two city boys, and they were mannerly, teachable, companionable, and generally satisfactory. I have had quite a number of well-educated men, some of whom were college graduates. Hired men who can discuss the topics of the day with intelligence, and make good suggestions about the work, are a delight. I like my men to be able to originate a pleasant thought now and then.

DIFFERENT MANURES.

J. W. I., SUGAR RUN, PA.—Some months ago the R. N.-Y. asked if there was much difference in the manure from different sorts of animals. By the manures of farm animals, I understand their voidings, both solids and liquids, unmixed with straw or other substances used for bedding. The value to the farmer of the manure of all animals depends on the quality or richness of the food they consume. The manure of cattle fattened on corn meal, is worth more than twice as much, bulk for bulk, as the manure of cattle that are fed only hay. The manure of animals wintered entirely on straw, would not be much, if any, better than the same amount of rotten straw, and probably not so good, as some of the richest ingredients would inevitably be extracted by the beasts to support animal life. It would seem from this that the manure of all animals fed entirely on the same substances would be exactly alike in quality: but such is not the case. Some animals masticate their food finer than others, digest it better, and probably extract less of the fertilizing substances from it. In my experience, the manure of sheep, fed entirely on grass or hay, is richer, weight for weight, than the manure of horses and cattle fed entirely on the same substances.

When cows and horses are both fed about the same amount of grain, there is not much difference in the quality of their manure for common farm crops; but horse manure, having the property of heating as it ferments, is obviously the best for hot-beds and starting vegetables early in the season when the ground is cold. Hog manure, where hogs are kept in the pen, is composed almost exclusively of grain, and consequently is richer than any other except that of poultry. Hogs are naturally neater than other animals, and if properly encouraged will take one corner of the pen for a privy, and consequently their manure can be obtained without much admixture of straw, and being also very free from the seeds of grass and weeds, it is very suitable for a garden manure. According to my experience, poultry manure (except the dung of geese and ducks) is the richest made on the farm. It is better than hog manure, because, in addition to the grain the fowls eat, they obtain for themselves, if running at large, a considerable part of their diet in insects and worms, and this without doubt improves the quality of their manure. Experienced poultry raisers usually supply their fowls, so far as possible, with scrapple and other waste animal products which make the hens lay better, and improve the quality of the manure.

Formerly I mixed my hen manure with plaster and used it as a top-dressing for corn. It had a good effect; but lately I have put it together with the hog manure on the garden. Cattle and horse manures, when fresh from the stables, contain too much straw, and unless composted and rotted are not suitable for a garden. If I practiced putting all kinds of manure on the fields, I would mix them all together thoroughly, so that they could be spread more evenly over the ground; the crops grown thereby would present a more uniform appearance, and produce a more uniform yield. A hungry man does not quarrel with his dinner. A hungry soil never rejects the gift of any kind of animal manure, and will respond most bountifully to the giver, if it only gets enough to satisfy its craving appetite and provide the necessary strength.

WHAT ARE THE OPPRESSED PEOPLE GOING TO DO ABOUT IT?

C. W. W., NORWALK, OHIO.—"What are the oppressed people going to do about it?" asks the RURAL on page 416 in regard to the trusts. There is a choice of just two things which they can do about it—First, they can do as they are doing—go on and pay tribute to the last cent they can bear to the railroad kings, the oil kings, the sugar kings, etc., as they are coming more and more to do; become abject subjects of combinations of capitalists who can do every line of business, and furnish every needful product cheaper than feeble individual enterprise without the like great capital can possibly do while they take tribute at their own pleasure from every man, woman and child in the land, whose occupation they have largely taken away.

Second; they can unite their strength into a combination greater than any trust or all trusts, which shall measure the needs of the people and supply them; which shall have for its object not the enrichment of its managers, but the service of its people, whose creature it must be, and that at the least possible instead of the greatest possible price. The day of small things has gone by. Competition having become universal through free communication, has eaten small competitors up, and forced greater combinations which in turn have consumed each other. The trusts are the result. The march of events cannot be turned backward. There remains just these two things for the people's choice—monopolies of moneyed kings, having for their object the enrichment of themselves by laying on the people the largest tribute that they can collect; or monopolies of the people themselves, having for their object to give the public the best service at the lowest cost. Can we doubt which of these two the people will choose when they realize their dilemma? The trouble under which they are groaning must grow worse and worse too, until they choose to act for themselves, and they can't do everything at once. Mr. Curtis is right, in the issue of June 8th. Better begin with the railroads. Doing so will count far more than anything else within reach, and better lose as little time about it as possible too.

The post-office is our model, and it is through Congress that our object must be reached. Who will act?

THE PARKER EARLE STRAWBERRY.

T. V. MUNSON, DENISON, TEXAS.—On page 414 of the RURAL for June 22, Mr. "W. B.," of Dayton, O., claims to have plants of a berry he purchased under the name of Parker Earle, and proceeds to describe a variety produced by me some years ago, as No. 3, and which Mr. J. T. Lovett was to disseminate as Parker Earle *should it prove worthy*. But after testing it, we considered it not sufficiently productive, and the variegated foliage it developed in the third year of its existence, and which it has since retained, was also against it. According to agreement with Mr Lovett, the variety was not to be named Parker Earle, unless he introduced it, which he has not done, except in so far as to place plants with a few parties for testing. If "W. B." bought the variety as Parker Earle, as he states, then somebody has committed an act not altogether honorable or honest. I sent out a few plants of No. 3, after Mr. Lovett gave it up, as Earle (not Parker Earle), but since then I have withdrawn both the name and variety from dissemination, as it is too shy a bearer to bear any name or be introduced. The true Parker Earle is an entirely different variety, and has never been disseminated, except that a few plants have been put in the hands of men above suspicion, to be tested. If there are any others who have received or bought plants of Parker Earle or Earle, of the description given by "W. B.," they will do the country a service by labelling them Munson's No. 3. They are unworthy to bear the honored name of Parker Earle, but there is a berry bearing that name of which Mr. Earle himself will be very proud, I have every reason to believe, and we shall see that it be not dishonored by being confounded with any other sort.

CULTIVATORS, "BUGS" AND POTATOES.

L. P. W., QUINCY, ILL.—In response to C. K., page 415, I am glad to say that I think the Hudson Bicycle Cultivator will "fill the bill" completely. On the strength of its being advertised in the RURAL and Mr. T. B. Terry's recommendation, I ventured to order one this spring, more especially for the benefit and interest of my youngest son (11 years old), who is very much pleased with it and soon became able to use it to good advantage. If C. K. will investigate this implement he will not be disappointed or find anything that will come more fully up to his requirements, for it is "easily handled" "works with little waste of land in turning" and is "adjusted for narrow or wide rows and deep or shallow plowing." I do not know of any walking cultivator that can be handled as easily as this riding one.

I am surprised at the article on the "Disappearance of the Colorado Potato Beetle" page 413, as its statements are just the reverse of what is true at this time, in this vicinity. I do not think I ever saw the old "bugs" more numerous than they were early in the season, but later the very wet, cold and unseasonable weather seemed unfavorable for their propagation and it looked as though they might disappear, until a short time ago when the young brood appeared in full force and now they are increasing rapidly. I have about three quarters of an acre of New Queen potatoes, the product of one pound planted last year, which I have preserved so far most effectually by hand-picking, having commenced as soon as the plants came through the soil.

THE RIGGS PLOW.

J. P., PRINCETON, N. J.—C. K., Bellville, N. J., will find the Riggs plow one of the best two-horse cultivators in existence. It has pole and handles. The operator walks behind and guides the machine. It has six reversible plows, three on each side of the row, that will turn the earth to or from the plants as desired, and will work any depth, from one to four inches. It has a roller attachment and is used for more purposes than any other implement I know of. It is used for covering peas, potatoes, corn, etc., and the ground is rolled over the seeds at the same time. As a cultivator it has no peer. In the early stage of the plants the front plows are set to turn the earth from them, the next turn it back again, while the hindmost thoroughly work the remainder of the soil. This cultivator is employed in Mercer county to the exclusion of almost every other, and is used for all crops grown in rows not less than 30 inches apart, such as peas, beans, potatoes, cabbage and corn, until the plants reach a hight of about three feet. This is very easily managed, especially in turning at the ends of the rows. No farmer here considers his list of tools complete without a Riggs plow.

W. P. M., MONROE, WIS.—Walking cultivators are latterly taking the lead in this locality, because better work can be done with them, and they are much easier on the team. Some farmers have discarded riding cultivators for walking, and could not be induced to change back. Can you write best with your feet or hands? A walking cultivator gives full control of the shovels to the hands; a rider to the feet only. I have seen some without a pole, but they are not liked and are no longer sold. All makes of walkers that I know of have four shovels only; some riders have six. With either kind space must be left for turning at the ends of the rows, or more or less corn will be broken down. Most kinds do good work, but still there is considerable difference between them. The new patterns with parallel movement, so that the shovels remain at right angles to the line of the row, no matter how much they are swung to one side or the other, seem to leave but little to be desired, unless flat culture is desired. The shovels will not do that, and can scarcely be run so shallow as one could desire. An attachment, called "moker" will do that. A "moker" consists of three steel five-eighth inch rods flattened at one end into a shape like a diamond cultivator tooth, and fastened in a cast-iron bar or bars, which can be attached to the shovel shank in place of the shovel—providing the shank is round and not over one inch in diameter. Four make a set. With them properly adjusted there are 12 teeth, with which one can scarify the surface, or cultivate to any depth up to six inches for a width of three feet with a tooth every three inches and without ridging or throwing dirt at all. Such a tool can work corn or anything else as soon as the rows can be followed, and as close to the plants as is desired. If hilling is desired, or grass and weeds get the start too much, the shovel can be used. Several walking cultivators are good; but I think the best one I have ever seen is the new pattern "Farmer's Friend" made at Dayton, Ohio. The "mokers" are made by the Sandwich Enterprise Co, Sandwich, Ill., and cost about $3 per set of four.

F. S. W., SMYRNA, DEL.—In reply to C. K., Belleville, N. J., I can say the Little Diamond riding cultivator answers fully the re-

quirements. He will also find that riding cultivators are easier to handle than walking cultivators, besides saving an infinite amount of walking. Walking cultivators are tongueless with the exception of one or two makes. C. K. will find, as the majority of farmers have found, that more work and better can be done with a riding than with any walking cultivator ever made, both relatively and absolutely.

J. H. A., RANDOLPH, N. Y.—C. K., Belleville, N. J. asks for a two-horse cultivator. P. P. Mast makes the simplest and best I have seen. I have used one for five years and think it would please him.

What Others Say.

POINTERS.

JOHN GOULD says, in the Weekly Press, that it is a mistake to suppose that sour cream makes more butter from the cream than sweet. Souring adds nothing; it simply assists the churn to recover more fat from the cream. In sweet cream the emulsion is perfect. If sweet cream is diluted about three times its bulk in water at 80 degrees, and allowed to rise a second time, the difference between the amount of sweet and sour cream butter will be inconsiderable, showing that souring the cream is, after all, only another way of liberating butter fats from the combined sugar, cheese, and fibrin emulsion. It was asserted by the late Professor Arnold that the adding of a small amount of pure cider vinegar to sweet cream just as the churn started would cause all the fats to come.....

IN a Scotch exchange (so says the Breeder's Gazette), it is narrated that last year when the price of potatoes was so low that they were fed quite freely to stock in some instances, a farmer of an inquiring turn of mind determined to test the preservative power of the silo on them and accordingly cut a quantity and placed them among chaff at the bottom of the "pit." Upon opening the silo recently the potatoes were found—so the account avers—as fresh as the day they were incarcerated, so to speak, and the cattle evince a decided appreciation of them if the avidity with which they are devoured be taken as evidence.....

IT has been found, says Hiram Smith of Wisconsin, that by raising a crop of fodder corn and putting it into the silo every acre will winter three cows and there is hardly one acre in Wisconsin that will winter one cow.

Corn put in the silo makes a great deal better feed than hay, and makes as good butter as ever was made in June, and the change from summer to winter dairying costs almost nothing. It may be done gradually; the cost is nothing, and there is all the time an increase of production.....

MR SMITH'S first silo was filled with corn, fed to 10 cows in the barn. He filled the silo from less than three acres, and kept 10 cows over the winter and three cows until the last of August, so as to see what the effect would be on the production of milk in the winter. They were confined in a small, dry yard; there is a shed in the yard, and water from a spring running through a pipe. They had plenty of water and all the silage they could eat, and eight pounds of bran. He fed a little hay, but they did not care for it; therefore he fed the cows all winter until the last of August without any other feed, practically, but silage and wheat middlings or bran.....

MME. GEORGES BRUANT. A writer in the London Garden, says that the new hybrid Rugosa raised from a cross between Rosa rugosa and the Bourbon Tea Sombreuil, is now flowering freely. The buds are fuller and better formed than those of last year, though still somewhat rough-looking; but from their pure whiteness they are decidedly effective on the plant, which is exceedingly vigorous and free, and their fragrance is simply delicious.

BECAUSE farmers cannot accumulate wealth, it is the fashion, says the N. Y. Times, to declare that they are poor and that farming does not pay. This is contradicted by the plainest facts. Can those be poor who produce the wealth of the world; whose products feed and clothe the world, and whose own necessities are first provided for most bountifully?.....

FORTY years ago the American farmer thought himself rich if after his domestic supplies were secured, he had a little left for moderate luxury. There are rich poor men and poor rich men, and the farmers who so wrongly think or imagine themselves to be poor are really the rich ones in all that makes one contented and happy in a rational and true way.....

FOR an industrious, reasonably skillful farmer may have such an income from his farm, all counted, as would be thought liberal by a city man who pays high rents and prices for what cost the farmer nothing that he counts, and who cannot afford the hire of horses and carriage, which the farmer never figures up. The wastes of farm life are fewer and less; the healthfulness of it far surpasses that of a city house, the comforts are more and greater, every physical need is better supplied, and the necessities of the mind are met incomparably better. .....

TO RIGHT-THINKING persons and those who are able to manage their affairs with discretion every advantage is in favor of the farmer, and where he complains of hardships or disadvantages the city dweller suffers every one that he does to a far greater extent. If the farmer complains of his work let him think of the artisan of the city depending upon the favor of an employer and spending his wages as they are earned, with the complete stoppage of income if he is sick, and the slave of the bell or whistle which calls him to his toil and holds him there without cessation until the hours are fully told, and compare this with his own circumstances.....

THE Red cedar, says Garden and Forest, is the most widely distributed of North American conifers, and in some parts of the country it is one of the most common trees; but it is in a few favored localities only that it grows in a way to produce the straight-grained material essential for pencil-making.

The distillation of oil of cedar, for which there is now a large commercial demand, from the sawdust and other refuse, has been profitable in the pencil-mills at Cedar Keys in Florida, and might be carried on to advantage in other parts of the country. It can be made, of course, from wood of the poorest quality.

THE LONDON LIVE STOCK JOURNAL has a wholesome belief in the arguments which have been advanced by Prof. Fleming and Mr. Dollar, veterinary surgeon to the Prince of Wales, that peculiar hoofs require peculiar methods of shoeing. Anybody who enters a shoemaker's shop must be struck with the show of lasts—not one of which is the same. There are no lasts for horses' hoofs; but if we had, the variety would be very interesting. In fact the horse's hoof, like the man's foot, must be measured and fitted.....

"ONE now sees farmers buying light, shallow-running cultivators and harrows, when but a few years ago a cultivator must be a subsoiler or nothing. That now and then a man succeeds admirably by deep cultivation of corn is no argument when the one success must disprove a whole line of average failures. The old argument that cutting off the top-roots made the lower ones run deeper and make a larger layer of fibrous feeders is not being proved.

THE drill system of planting is coming in very fast here and is very satisfactory all around. This year many are using force-feed wheat drills to plant corn with. They stop up all the feed throats but two, three and a half feet apart, shut down the feed so as to get on about six quarts per acre, and if after dragging they find too much corn they pull out some. Others use the single rower that drops a grain of corn each 10 or 12 inches. This system causes better preparation of the ground and few farmers now say: 'Get in the corn in any shape; the land can be fitted as we cultivate.'

So says John Gould in the Weekly Press—and so, to-day, say the majority of progressive farmers. But 12 years ago the R. N.-Y. stood alone in its earnest advocacy of "shallow cultivation, drill-planting and surface fertilizing." It was several years after this that Dr. Sturtevant, the American Agriculturist and a few other journals were advocating "root-pruning."....

PROF. C. V. RILEY makes the following remarkable statement in the American Agriculturist:

"At River Edge, N. J., they found last season that a mixture of pyrethrum and water made a very excellent liquid to spray upon the vines. *It destroyed all of the insects which it touched and seemed also to have a preventive action. The proper proportion can only be obtained by further experiment.* Col. Pearson, of New Jersey, has also found that the original fungicide mixture of sulphide of copper and lime and water sprayed upon grape vines has *both a poisoning and deterring effect upon the rose-bug.* This insect is one which I hope to have a good series of experiments made upon with a view of determining just what is best to be done."

The Italics are ours. There are several decidedly erroneous statements in the above, which the Agriculturist and Prof. Riley ought to correct. The pyrethrum water did *not* "*destroy* all of the insects which it touched." Neither did it seem to have "a deterring effect." We found it necessary to spray all infested plants nearly every day during the hight of the rose-bug season. Most of the beetles receiving the spray would in 20 minutes or less either fall to the ground or fly away. In the former case they would lie on the ground or grass and wriggle for from six to 24 hours. *Some* would die; many would recover. These results were verified by collecting the beetles after they had received the spray and placing them in tomato cans covered with mosquito netting. As for the "proper proportions," these are well known and no further experiment is called for. Supposing that the powder is fresh and pure, one heaping table-spoonful to one gallon of water will affect the beetles in just the same way that a larger quantity will do, while less than that has been found less effective. In fact the table-spoonful of powder to one gallon of water is just as effective as if the beetles were treated to the dry powder. We are not aware that Col. Pearson ever said that he found copper sulphate (not "sulphide") and lime (the Bordeaux Mixture) "has both a poisoning and deterring effect upon the rose-bug." He thought it *might* have since the sprayed vines were, it seemed, less infested than those not sprayed.

Now the R. N.-Y. with a view to testing this question, sprayed about half of its vines thoroughly with the Bordeaux Mixture. Some of those so sprayed (Moore's Early and Berckmans, *e. g.*) were injured more by the rose-beetles than *any* of those not sprayed....

A WRITER in the American Agriculturist, after giving the details of a potato experiment made by himself, says:

"A valuable experiment, and one well worth trying by any one interested in the matter, would be to fertilize a number of similar and adjacent sections of ground with gradually increasing amounts of fertilizer (say 200 pounds, 300 pounds, etc., to the acre), and determine which gave the maximum economy—*i, e.*, the greatest net gain after deducting the cost of fertilizer from the value of the crop.

This is one of the experiments the R. N.-Y. began, at least 10 years ago and has continued since. The results are (1) that the more impoverished the soil, the greater is the increase of crop from increased quantities of high-grade potato fertilizer up to 1,800 pounds to the acre. A larger quantity of fertilizer (2,000 pounds) increases the crop, but the margin of profit then becomes doubtful. Second, if the land needs all kinds of plant food, the crop will not profitably be increased by the use of one or any two. Third, that the richer the land, the less is the crop increased by fertilizers. The R. N.-Y. commenced these experiments when experiment stations were scarcely known in this country.....

THE experiments of this kind being carried on the present season at the Rural Grounds, as judged by the vines, are more emphatic than ever before in answering, without any contradictions, the question of how much fertilizer may profitably be given the potato. Beginning with 440 pounds to the acre, the amount increases to 880, 1,760 and 2,200. There are four duplicates and in every case, the larger quantity of fertilizer is plainly shown by the larger vines.....

NEW YORK HERALD:

"MRS. R B. Hayes, the friend of unfashionable virtues.

——FARM JOURNAL:

"Cross-bred pigs will grow the fastest.

One long pig will outweigh two chubs.

Save the pigs with long bodies for next year.

The best breed is no breed; that is cross-bred.

Use a thoroughbred sire and a sow with the most length of body.

If the old sows have done well, winter them. Do not keep them fat.

——THE coming horse for the farm should be a mule. The mule can be kep on one-third less than the horse.

——A VERY simple method of curing the gapes in chicks, and one that is successful in the hands of some persons, is to pinch the wind-pipe. With the left hand hold the head of the bird up and the neck straight, and with the thumb and finger of the right hand pinch the wind-pipe smartly, slightly rolling it. Begin as low down as possible and follow it upward to the mouth. Be careful to release it frequently to give the bird a chance to cough up the crushed parasites."

——PUCK: "The burglar makes hay while the moon shines."

——HENRY STEWART: "The new 'invention,' so called of ripening cream by the use of a lactic ferment, which has been claimed to have been made by a Mr. Boyd, a creamery owner in Illinois, is said to consist of a mixture with sweet cream of a certain quantity of soured skimmed-milk which has been warmed to 90 degrees and then kept for 24 hours in a close vessel from contact with air. This soured milk, or "lactic ferment," is called a "starter." There is nothing new in this process in principle. It is simply souring the cream by adding sour milk to it, and this had been done years ago by our grandmothers in effect, but not precisely by the use of a closed vessel to put the warmed milk in to sour. It has been quite common to pour the remnants of the cream ripened in the usual old-fashioned manner into the fresh cream to sour it in time for churning. In fact, in the business of dairying, as in other agricultural methods, more has been forgotten than many persons who claim to be inventors of new processes ever knew."

——THOMAS MEEHAN in the Philadelphia Press: "The York and Lancaster rose, with its beautiful striped flowers, is now uncommon in gardens, though here and there to be found in country yards. These and all other roses can be increased by layering at this season. A slow but sure way. Small depressions in lawns can be readily filled up by sprinkling fine earth over them a little at a time. Strong grass will easily push through half an inch of earth Put it on right after a mowing."

——PROF. A. J. COOK, in N. Y. Tribune: "Mr. J. A Pearce, Grand Rapids, Mich., had a fine apiary of fifty-eight colonies this spring, when the fruit-trees blossomed. A neighbor sprayed his orchard when in full bloom, while Mr. Pearce's bees were working in full force. Result: the bees are seriously poisoned; are dying rapidly."

——HIRAM SMITH: "You see, a cow will chew her cud six hours every day if she is properly fed, and that is about as hard work as chewing gum."

——LIEUT. GOV. JONES: "The more a man knows the greater will be his veneration for the man who knows more than he."

——LONGFELLOW:

"Study yourselves: and most of all note well.
Wherein kind nature meant you to excel."

For Sunstroke

Use Horsford's Acid Phosphate.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JULY 13, 1889.

SPECIAL NOTICE.

IN reply to inquiries we may state that the lower portion of the flowers of the potato R. N.-Y. No. 2 is purple. This purplish color covers about *half* the corolla. The outer portion is nearly white. This variety *never bears white* flowers. The stems also are, here and there, *tinted* with purple. They are long-jointed and do not branch as freely as most other varieties.

The R. N.-Y. wheats promise to give a heavier yield than ever before—probably close upon 40 bushels to the acre. It interests our farm neighbors greatly that such a yield should be the outcome of single grains planted a foot apart each way.

THE wet weather has served to discourage a good many haymakers. A great deal of hay has been put into the barn in a condition that would not have been tolerated in a dry season. Indeed, some of this hay is in such a state that quite a number of farmers are nervous about "spontaneous combustion;" several have written the R. N.-Y. about the matter. Next week we will give some little space to this subject. Other farmers, particularly those in Canada, are thinking seriously of putting a good deal of their grass into the silo. They are tired of "haying between showers" As we write, the sun comes out again warm and bright, and we sincerely hope its presence betokens suitable harvest weather.

"When I contrast my occupation with those of friends who are in business in the villages around me, and see the lives they live, I conclude that I am as well off as they are, although some have things nicer than we, and have more advantages as to society than it is possible for us to have. But if I am not mistaken, all can see things that they wish they might have different from what they do have."—G. A. B., page 458.

THAT audacious intruder, the English sparrow, is justly denounced by the Department of Agriculture. He is accused of eating grains and seeds in destructive quantities, both in field and garden, of destroying great quantities of vegetables and fruits, and of maltreating and driving from their homes many of our cherished warblers and other birds, and of being noisy, quarrelsome and filthy. To get rid of the pests it is recommended that bounties should be offered by the various States to promote their wholesale destruction. Individual efforts to exterminate them in the way of nest destruction, shooting, trapping and poisoning are strongly urged. A strong objection to the last, however, lies in the danger that other birds as well as other creatures would be endangered by it. What are you doing to abate the nuisance?

A MICHIGAN subscriber sends the following request:

"Will the RURAL ask some of its subscribers who have a hay press, to put up a few bales of freshly cut Timothy, clover or corn, as an experiment? It seems to me that it would be so much like silage, that it would probably keep if packed very solidly."

The R. N.-Y. seconds this request. Will not hay press men try this? Some experiments have been made in years past in this matter, and the weight of evidence seems to be against the practice. The difficulty seems to be that the pressed grass will not keep well. However, the experiments should be continued until we know all about it. We can readily see that baled grass would find a good sale in the city markets. The question is—is it possible to bale the grass? We hope some of our readers will help answer this question.

"If a farmer with a family were to leave his farm and take a place at a trade, and get $12 per week, he would wonder where his money went to if he had to buy the same things he had without price on the farm."—M. L., page 459.

IN addition to the trial contest plots, the R. N.-Y. is trying to raise large yields of potatoes on a measured acre, and also on a half-acre. These crops are looking well just now, and with a continuance of the rainy season we hope for good yields. There is quite a difference in the number of potatoes found in a single hill. Here is the result of a little investigation made the other day: The potatoes were all small and we counted all of them, even those just beginning to form. By "hill" we mean the vine or vines that grew from a single seed-piece.

Brownell's Winner	20 and 21
Rural New-Yorker No. 2	16
State of Maine	11
Clark's No. 1	8

The Brownell's Winner and State of Maine are growing in the same field and have received exactly the same amount of fertilizer. Does the large number of tubers formed on the Brownell's Winner indicate a heavy yield of small potatoes? We think not, but rather believe that with plenty of moisture, a majority of the tubers will be of marketable size. We shall all see in the fall.

ACCORDING to Ex-Governor Glick, of Kansas, for many years an extensive cattle raiser, the beef and pork combine at Chicago, and Kansas City and other Western packing centers, has worked more harm to the farmers and stock-raisers of his State than all the grasshopper invasions and droughts that ever devastated it. Recent developments before the National Railroad Commissioners at Chicago show one way in which such combinations injure farmers. One packer had reluctantly to confess that in November, 1886 he, with eight others, signed an agreement to keep down the price of hogs and keep up the price of pork by closing some of the packing houses and regulating the supply. The agreement has been maintained ever since and will not expire before next November. Each packing house has to do only a certain percentage of the total business of the pool Eac week it pays a bonus which averages 4¼ cents, on each hog killed over its quota, and receives a bonus of so much per hog on the number less than its quota which it kills. Over $300,000 have been already paid out in this way, and some of the firms which have packed no hogs whatever for one or two years have continued to receive the bonus. Of course, the aggregate amount of the bonus as well as the extra profits made through the agreement comes from the pockets of the producers and consumers. The combine fleece the public on both sides with both hands. In spite of all that has been said against such combinations, they continue to flourish more and more vigorously.

"When a man has an opportunity to provide well for his family, with a little surplus to lay by and contribute to the wants of those around him, he is, in my estimation, in a most desirable position to let well enough alone."—page 459

WHO IS TO JUDGE EXPERIMENT WORK?

THE R. N.-Y. is informed that the Hatch bill provides no remedy for the wrongs perpetrated at the Missouri Agricultural College, and that the Department of Agriculture at Washington has no control over the action of the directors of the stations. They report, so our informant states, to the Governors of the States, and furnish copies of such reports to the Washington Department and to the Secretary of the Treasury. The Secretary of the Treasury accepts such reports as conclusive. The R. N.-Y. was under the impression that the powers of the officials of the Department of Agriculture were larger in such matters. If, as stated, they have "no control over the action of the directors," it is certainly unreasonable to call upon them to apply a remedy?

But who is responsible? It may be just as well to settle this matter now as at any other time. We are establishing a precedent. The directors of these stations are to be held responsible for the proper use of the money appropriated for experiment work, but who is to decide as to the quality of that work?

The R. N.-Y. does not think the directors of the Missouri Station have shown themselves proper persons to superintend valuable experiments. They have certainly permitted personal and political antagonism to guide their actions, and we firmly believe that an investigation will reveal a clear misappropriation of funds. Now then, the R. N.-Y. wants to know who is to hold these directors responsible? When the Hatch bill was before Congress, the R. N.-Y. pointed out this very defect. We were assured that certain amendments would surely remove it. One of the prime movers in securing the passage of the bill, wrote the R. N.-Y.—page 25, 1887. "If it appears from the reports of any station that the funds are being misapplied, the agricultural press of the country will see to it that this fact is brought to the attention of Congress, when the appropriation will either be withdrawn, or the station will be allowed another year to amend its ways, according to the discretion of Congress." This read well before the stations were established, but how about it now? Are the agricultural papers of the country to be the sole judges? Who decides upon the value of these bulletins and reports?

The R. N.-Y. could easily pick out a dozen that are not, in its opinion, worth the paper they are printed on. There ought to be some central power that can weigh the work of the stations, investigate reputed wrongs and be able to apply some remedy. Perhaps there is such a power. Where is it? That is what the R. N.-Y. wants to know. When it is located we will try and get it to establish a precedent. Some *of the framers of* the Hatch bill should make these points clearer than they are.

"Five or even $10 a month are no great object with me as between a first class and a poor hand."—Page 462.

TAKE YOUR CHOICE.

TAKING the best catalogue near at hand, we find announced, under a display heading of "Non-poisonous insect powders" first "Peroxide of Silicate" and second "Hammond's Slug-shot." The price of either by the barrel (say 200 pounds) is four cents per pound or eight dollars. These compounds ought not to be called non-poisonous since their insect-killing power depends upon arsenic in some form. It is true that the poison is so extended with harmless substances, such as plaster or lime, that in 99 cases in 100 there is little likelihood of any animal eating enough of the mixture to kill or even sicken it. Nevertheless there is a *chance* that, through accident, oversight or negligence, the poison may not in the *hundredth* case be thoroughly and equally distributed through the diluting substance and that therefore, a small quantity might, if lapped by horses or cattle, or accidentally mingled with their food, endanger life.

That Slug-shot is a well-prepared insecticide the R. N.-Y. knows to be a fact. That it is no better in any way than a pound of pure Paris green thoroughly intermingled with 200 pounds of plaster, it *believes* to be a fact. Now a barrel of fine plaster costs, say $1.25. A pound of fine Paris-green costs, say, 30 cents, or one of London-purple, 20 cents, estimating them at the highest figures. The barrel of plaster and the poison can be thoroughly mixed in one hour at a cost of less than 25 cents for labor. We have now at a cost of $1.75, 200 pounds of an insecticide just as effective and just as safe as is either Slug-shot or Silicate at a cost of $8.00 for the same quantity. If this statement is not trustworthy, gentlemen, tell us wherein it is faulty and the R. N.-Y. will gladly revise it accordingly.

It is quite against the R. N.-Y.'s pecuniary interests to present such subjects in this way. Both firms advertise their insecticides freely, and the R. N.-Y. has been favored with its full share of their patronage. If our readers prefer to pay $8 and freight for an article no better than they can manufacture at home for $1.75, that is their affair. Directing not controlling their choice is the R. N.-Y.'s province. As Slug-shot and the Peroxide of Silicate are mentioned together in the above remarks as if of equal value, it is simply just to add the remark that whereas we have never known the Slug-shot to harm the foliage to which it has been applied, harmful effects have invariably followed the use of the Silicate.

"Why do I farm? For health, pleasure and profit. Health comes from the out-door life; pleasure from the contact with nature; profit from a good farm and good farming—an additional source of pleasure."—page 459.

BREVITIES.

A WORTHLESS cur makes valuable soap grease.

READ what Prof. A. J. Cook says about poisoning bees.

THE cows like sweet apples. The horse will not refuse them either.

IT seems to be "every man to his taste" in cultivators in "discussion" this week.

MAKE ready for quite a surprising discussion of the proposed tariff on bananas.

IT seems too bad that our cattle must suffer from the attacks of flies. Can we not think of some practical remedy?

READERS who have ever had any experience with feeding hogs on swill or hotel refuse, hauled from the town, are requested to send us their names.

FOR an impartial, dispassionate, thoroughly sensible discussion of the "Woman Question," read "Women as Women" by "Aunt Ancient" on page 466.

FOR the light, sandy soil of the south portion of Long Island, there is no other strawberry that *approaches* the Charles Downing for size and quality. It is for that section the perfect berry.

IT will be remembered that for three years past a large amount of powdered sulphur has been used on the R. N.-Y. potato contest plot, and that it has been thought that it has protected the tubers against the wire-worms, which in this soil seem to cause "scab." This year no sulphur was used.

A FARMER in Clinton county, N. Y., sends the following reasons for being satisfied with life: "I have two boys, one 18 and the other 16, and a girl 14 years old, the best wife in the country, as good a hired man as they make, and 200 acres of land to look after. I do not think I need to complain."

THE leaves of cherry trees on certain parts of Long Island have been destroyed by a fungus, so that the trees look as if it were November. Some of the main roads near the R. N.-Y. Farm, which are lined with cherry trees, planted for ornament as well as for fruit, present a desolate appearance, far more in keeping with late fall than mid-summer. The R. N.-Y. is endeavoring to find out the cause of and remedy for this new destroyer.

SEVERAL newspaper correspondents notably Mr. De Young, of the San Francisco Chronicle, having declared that the American exhibit of cereals at the Paris Exposition would hardly do credit to a county fair, Secretary Rusk inquired about the matter, and has just received a cablegram from General U. B. Franklin, the American Commissioner, saying: "All juries that have examined the agricultural exhibit of the United States pronounce it excellent in all respects. So do I." Of the $250,000 appropriated by Congress for the American display, $25,000 were set apart for the agricultural portion of it. Surely a creditable show could be easily made for that sum.

A PHILOSOPHER of Cobden, Illinois (H. M. T. C.), after showing that human beings are fond of clustering together in proportion as they are uncivilized—when danger induces it—or uncultured—when they have no thoughts, either of their own or preserved in books, for company—goes on to show, very fully, how the occupied mind becomes freed from superstitious fears, such as that of being alone in the dark, and from temptations and beguilements which a craving for company exposes one to. He concludes that it is of first importance to the well-being and happy existence of young people to provide them with occupations interesting enough to be sufficent companionship for some time, until at length such habits of research and industry and thought are formed as to establish self-content, self-reliance and self-control. Such young persons will be welcome in any good society, yet will be well satisfied with only their own. A boy who can work contentedly alone in his own shop or garden, or a girl in her room for hours, has safely secured a chief condition for a happy, contented, useful and honorable life.

The Poultry Yard.

PROFIT IN POULTRY.

"Do you think there is any money in poultry?" said a young farmer to me one day. "My wife has the hen fever and thinks of going into poultry raising quite extensively another winter, for the purpose of raising broilers. She likes to fuss with hens, but when I go near them, they fly all over me, get on my head, and are altogether too familiar; I can't stand it." His question was a fair one; it has been asked hundreds of times before, and in all probability will be asked times innumerable in the future. Any man embarking in any new venture, financial, mechanical, agricultural or otherwise, wishes to know whether the dollar he puts into it is likely to be returned to him with a few added cents as interest on his investment. Any man (and man embraces woman, 'tis said,) with a sound head will settle this point before embarking in any new enterprise.

In the case mentioned above it is safe to say that the farmer referred to will not make poultry pay. He "can't spend time fussing with them." He doesn't want them "climbing all over him." He had better "quit the business before he begins it." If there is one occupation that requires "fussing" more than another, raising poultry is that one. The secret of success in the whole business is attention to little things. That farmer's wife will be very likely to make it pay, if she goes at it in the right way. Women are usually more successful with poultry than men, for the very reason that they will pay more attention to the details.

As to the profits to be derived from poultry, the same pains-taking care, and the application of the same business principles that would insure success in any other occupation, combined with a thorough knowledge of the business, would prove fairly remunerative in this. There have been many failures and disappointments among beginners These have usually resulted from over-enthusiastic individuals embarking in it without sufficient experience, or a willingness to give proper attention to details. A man has a small flock of hens which prove quite profitable, yielding a net income, say, of one dollar per head. Ten hens, $10 dollars profit; 1,000 hens, $1,000 profit. Thus he reasons. Why not? If the poultryman can surround his 1,000 hens with the same conditions which surround the 10, there is no earthly reason why he cannot make a proportionate profit. But, can he? Hens will not succeed in large flocks, hence they must be kept in small numbers.

He must expect to spend more time in caring for a large number than he would for the smaller one. He must learn the business thoroughly before engaging in it extensively. He must remember that good things come slowly, and must not expect to make a fortune all at once. If he really wants to make a business of keeping poultry, he should try a few hens at first and get all the information he can from all possible sources. If he succeeds with the few, he may increase the number by raising chickens from his own flock, and thus avoid the cash outlay necessary if hens are purchased. This may seem like a slow way, but it is a safe one, and the poultryman will thus be more likely to make the fortune he is after, than he would be in any other way.

If he has the broiler business in mind, the same remarks will apply about beginning in a small way. Artificial incubators, brooders, etc., are a necessity, and the outlay must of necessity be considerable. Incessant attention is necessary, and while physical strength is not so indispensable as it is in some other occupations, those who are averse to hard work had better shun the business Yes, there is money in poultry, just as there is money in dairying, in fruit-growing, stock-raising, etc., but as there are many who fail to get the money there is in these and other occupations, so there are those who will fail to get the money there is in poultry. F. H. V.

NOTES.

The only sure cure for an egg-eating hen is a sharp ax or hatchet vigorously applied just back of the ears. The mischief may sometimes be prevented by making the nests so dark that the hens cannot see the eggs, but this is simply a preventive, not a cure.

Change the Feed.—The hens appreciate a change of diet as well as you do.

If you have any fowls to dispose of this year, get them in good condition and sell them as soon as they stop laying for the summer. They will sell for more then, and much feed will be saved.

This is the time of year when the theorist comes to the front with his cures for gapes, lice, cholera, etc. Some man with a half-dozen hens knows more about these complaints than the experienced poultryman who has kept fowls all his life.

Miscellaneous.

FARMERS AND TRUSTS.

The situation viewed from a dealer's standpoint; human selfishness and greed, common to all classes, the immemorial cause of monopolies of all kinds; those who complain loudest against trusts ready to join one for their own benefit; moderation of trusts; prices regulated by the relation of supply and demand. If prices can be fairly forced up by a natural scarcity, why not by an artificial one? It is equally wrong to force prices up or down beyond a reasonable profit on the cost of production and handling; the artificial organization of society responsible for all the evils; an instance in point; the moral of it all.

There are two sides to every question, it is said, and the longer I live the more clearly I apprehend the truth of the saying. It would seem that there could be only one side to the matter of monopolies—of trusts—and yet there is a standpoint in which at least an apology can be made for the evil things. Monopolies have existed as long as man has existed: they are not a new thing. They are of all grades, big and little. It is the big ones which the enormous wealth of the period has promoted, that cause the excitement. They all proceed from the selfishness of the human heart, and this selfishness is not confined to one class, whether capitalist, manufacturer, merchant or farmer, to men of large means or of small. The men who are loud in their outcry against combinations are just as ready to combine when they can. Farmers have made combinations as well as other classes. They have not succeeded, perhaps, but success is not in the discussion. It may be said that they have not aimed at obtaining extortionate prices, and it can be said with as much truth, that other combinations have not aimed at anything more than to secure fair profits which they could not separately do. A patent gives a monopoly to one man and often he gets enormous profits in consequence, yet it seems to be conceded that he should have them. If an article becomes scarce the price is raised and no especial complaint is made unless the scarcity is due to the action of a known combination. If a scarcity of flour is threatened, and the retail grocer puts up the price, who complains whether it is advanced five or fifty per cent.? As soon as the scarcity is surmised, the farmer asks more for his wheat, and if there is no open combination there is a tacit agreement to force the price up. Where is the difference, morally, between this attempted combination, and the salt trust or the binder-twine trust? Now if it is a wrong to force the price of salt, wheat or other product to a higher price, or one unnaturally high, it is as much a wrong to force the price down below a living price. It is the same wrong whether the price is made to go up or down, and it all comes from the selfishness of man, from the artificial situation of society, and this is no worse in one class than in another.

All this can be shown more clearly by an illustration which is apt and true, as it happened in the experience of the writer, and it was this story that I now relate that brought these thoughts to my mind.

Last year the best manila binder twine was sold by the makers at 12½ cents per pound in large lots. At least that was the price paid for 10,000 pounds by a dealer, a neighbor of mine. He sold out his stock of hardware, but was unable to sell the twine with it, and he then placed it in my hands to sell on commission. Dealers were asking farmers 16 cents per pound for the best quality of twine, which would yield them a profit of three cents per pound. In large lots the price would be cut. The crop of wheat was very short and twine plentiful. The prospect of selling the whole stock on my hands was poor, so the owner determined to put the price at 14 cents which would yield him a profit of perhaps a-half cent over freight, and a small commission. The sale was well advertised. Do you think the farmers rushed in to take this good twine at a low price? Well, they came; but they were not satisfied with the price. They went from one store to another, quoting the price of inferior twine, joined together to beat down the price and actually compelled the greater part to be sold at a price without profit or below cost to the dealer. They were not any better satisfied with it at 14 cents than they will be this year at 18 cents or over. What do you think the feeling of this dealer will be in regard to this particular trust? Probably he will not shed tears if those farmers have to pay a much higher price this year than last. Then how can those farmers consistently condemn the trust? Which shows the greater selfishness?

The moral of this is that no class can lay claim to the virtue of unselfishness. If men get too greedy and require us to pay them what we regard as too much profit, let us fight them as we can, but do not let us assume that we as a class of producers or dealers are superior to them. As society is now organized, it is the practice of every class, including farmers, to buy cheap and sell dear. Society is organized on the principle of selfishness, nor is it likely to be changed until the millenium. Yet it is our duty to restrain this greed not only in others but in ourselves as well.

I hope the meaning of this article will be seen. It is only to make the matter clear that it is written—to show that one class should not be arrayed against another; for here the injunction: "Let him that is without sin cast the first stone," aptly applies. If any man or any set of men claim too much, let us use every honorable method to circumvent their designs, but don't let us whine and exclaim against the greed of men when no class is exempt from the failing. This is written from the standpoint of a DEALER.

Since the foregoing was written, the following appeared among the Associated Press dispatches—a very apt corroboration of what has been said and one that needs no further comment:

Evansville, Ind., June 24.—A combination of farmers exists in this part of Indiana that is having serious effect on the merchants in various towns. The farmers combine and agree to purchase from only one store in a town, the owner agreeing to sell at a net profit of 10 per cent. The farmers reserve the right to examine his books and invoices. In some instances dealers have obtained two invoices—one true, the other false—to show the farmers' committee. If the combination continues, as it probably will, a number of merchants will be compelled to leave for other fields of business. Already there has been a serious embarrassment in consequence of this attempt to destroy competition. DEALER.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

Just now—indeed at all times—the question of cleanliness is most important Careful bathing, or thorough washing and sponging all over the body, is a necessity. As a matter of fact, one may bathe as thoroughly with a couple of basinfuls as in a big tub, only the process is not so agreeable. Have a rug to stand on—a large square of burlap is good—and then see that the washing is well performed. A few drops of ammonia in the water will remove any odor of perspiration. If the skin on the face and hands seems harsh and dry, put a tea-spoonful of glycerine in a basin of warm water, and the difficulty is removed. In summer, especially, women with delicate skin should take care that they do not scrub too hard with a rough towel, as it is apt to chafe the skin.

* * *

Fully as important as the complexion during the warm months is the care of the feet. Thorough cleanlinesss is the only producer of comfort. Those unfortunates who are troubled with much perspiration from the feet will do well to put a very few drops of carbolic acid in water for bathing them. This prevents any odor. Another necessity for the comfort of the feet is regular cutting and filing of the toe nails. With proper care there is comparatively little risk of the tortures of an ingrowing nail.

* *

And the hair too needs extra care in the summer. It should not go longer than a week without washing, for when there is much perspiration it is in great need of cleaning. Don't we all know people, otherwise clean, whose hair seems positively *frowsy*—we can use no other word—for want of a good washing? Use either Ivory or tar soap; the former cleanses without irritating; the latter removes dandruff and seems to stimulate the scalp. When rinsing the soap out, a few drops of ammonia in the water will be beneficial, but too much dries out the hair, and renders it very unruly. In addition to the washing, thorough and frequent brushing must be insisted on. Thorough brushing is the one thing necessary to give hair its natural gloss.

As for hair dressing, the fashion now is to wear anything most becoming. Those loose, untidy French twists are very bad style now, but the hair may be worn either high or low. Neat, trim styles are most fashionable, but the tight, exaggerated Psyché knot is little worn. Most stylish for young women is a flat, round knot of fine plaits, worn just above the nape of the neck. This is the basket plait; according to the highest model it is just as flat and round as a basket lid. It is most becoming to small heads.

OUTINGS IN NEW ENGLAND.

XII.

MARY WAGER FISHER.

To sit on piazzas and hear people talk is one of the inevitable amusements at the sea-shore, and in listening to the chatter of women I was often reminded of the talk in Mr. Howells's novels. A young California lady once said to me: "Do the women in New England talk as Mr. Howells makes them talk in his books?" I replied in the affirmative, and when I mentioned the matter to a young Boston teacher, she laughingly said: "Yes, we *do* talk just as he makes us talk. He couldn't have hit us off better, if he had sat on a hotel piazza for a week and taken down the conversation stenographically." One of the Marblehead cottagers who knew everybody and whom every body liked, was quite a character in this way. He had graduated from Harvard with distinction, but at the expense of his health which, as he believed, was irretrievably ruined, producing some heart and nervous troubles which prevented him from sleeping while lying down, so that for a quarter of a century he had slept in a rocking chair. It was his habit, every night, to run around the "Neck" for exercise and to induce sleep, and for 30 years he had daily run three miles. He was an active, cheerful man, of great intelligence, an omnivorous reader and in his early manhood he had been a clergyman and had preached in a good many country churches. His ideas of living were of great simplicity, and he practiced what he preached, which was better. He often talked of the foolish way in which people wear out and waste themselves in efforts to imitate the methods and styles of others, a weakness which sacrifices all interior growth to outside show. In this way he explained the decline and failure of farming in New England, in the neighborhood of towns, like Adam, laying all the blame upon the woman—the desire of the farm women to dress like their town sisters and to furnish their country homes like town houses—pianos, silk gowns, and hire help instead of doing the work themselves.

Of course, in a place like Marblehead, with its beautiful harbor, yacht clubs and no end of pleasure boats, a great deal of time is spent on the water in rowing and sailing. One day we took a skipper and yacht and sailed 20 miles up the coast to Gloucester, a fish town, the foremost fishing port in the world, and just how it has happened that Gloucester, of all the Atlantic coast towns, has retained its supremacy in fishing, I am unable to say. It is a very picturesque place—with some 20,000 people, or more—and a great resort for artists, whose white umbrellas are pitched about in great profusion. The fishing outfit of the city counts 500 sail boats, and $3,000,000 worth of fish are taken annually. The shops of boat gear—ship chandlers' shops—are very interesting. A good many of the Gloucester young men obtain service in the merchant marine and serve in the navy. There seem to be a great many idle men on the wharves, and it is an easy matter to start one off on a sea yarn. On our way up we sailed across Salem harbor, past the beautiful Beverly Farms, a favorite outing place with Dr. Holmes, (Whittier lives near Salem); past Manchester-by-the-Sea, where the sandy beach sings when you walk on it; past Magnolia, so named for its native trees, uncommon elsewhere in New England, and so on to Gloucester. On the way, we passed a rocky island called "Norman's Woe" (see Longfellow's poem), Little and Great Misery Islands, and in sight of the Isles of Shoals well out at sea. Celia Thaxter, the poetess, has made these islands somewhat famous, especially the one called Appledore. A greatly admiring friend of hers told me that Celia's father, becoming disappointed and disgusted with the way the world wagged, bought a farm on Appledore, and removed thither from the mainland with his wife, a sweet and lovely creature, and the three children, all of tender years. Here Celia—the only girl—grew up in a hermit-like way. The wind blew so in winter that in passing from the house to the barn, they had to go on all fours to keep to terra firma. When Celia was about 14 years old, a young

college student, dreamy, poetic and impractical, came to the island. He was the first young man, besides her brothers, that she had ever known. They fell straightway in love and were married, and they went near Boston to live. The young husband's name was Thaxter; he had some property, but his devotion to poetical things obliged the wife to be the chief burden-bearer of the family, and in order to increase their revenues, she acted upon the suggestion of an acquaintance who appreciated her fine mental gifts, to try her hand at writing. She wrote a poem, sent it to the Atlantic Monthly, and in due time received $10 for it, with a request for more, which settled her bent for literature. Subsequently her husband died, and she built a cottage near her old home where her brothers still lived, and where she still makes her home in summer. She is the mother of three sons, one of whom is a physician. She is exceedingly clever, paints well, is gifted in anecdote and repartee, and is a fine talker. In winter she lives in Boston.

Although we sailed merrily enough on our upward trip, we had rather a sorry time coming back, as the wind had risen, the sea was rough and it was a frequent occurrence for a wave to send a shower of spray over the deck of the yacht, which would have drenched us to the skin, but for our great coats of water-proof. The members of the party who were given to sea-sickness succumbed, but although it is a malady from which I do not suffer, I think it is exceedingly fatiguing to be long at sea in any kind of a craft.

The frequent yacht races at Marblehead furnished much entertainment, as well as the music at the club houses. It was always a sight to see the "Volunteer" come in, her mast standing higher than any building in the town. Mr. Burgess, her designer, and the architect of many another fleet boat, lived on the "Neck"—a man far less striking in appearance than newspaper portraits represent him to be. We chanced to be out in a dory one day, and seeing the Volunteer at anchor, asked leave to go on board, which was pleasantly granted. It was interesting to see with what ingenuity, lightness with strength had been combined. Eighteen men formed her crew. One day an unusual-looking ship appeared in the harbor, which proved to be the "St. Mary," the New York training school ship. She was built in 1846 to catch slavers, and after a varied career was put to her present use. She is an antiquated boat, but well enough fitted for training boys for the sea, or for training out of them the sea-going desire. For parents afflicted with lads inclined to be unruly, or bound to go to sea, it is a very good thing to place them in this school of which a year's experience is generally enough to cure them of their idiosyncrasies. Some of the boys, however, like it well enough to become sailors in earnest. The discipline on board obliges them to do with punctuality what nearly every boy finds detestable—to keep his bed, wardrobe, etc., in perfect order and neatness, wash and mend his clothes, and learn how to cook, to wash tin dishes and to scrub.

"DON'T."—AT HOME.

OLIVE E. DANA.

THIS little word has been overworked of late, but there is still need of its application in the household. There are certain occasions, trifling maybe in themselves and taken singly and belonging among the minor morals, concerning which one longs to say emphatically: "Don't." Not that we who write are altogether void of offence in these matters. Indeed, this monosyllabic contraction of the imperative mood is never spoken so sharply and forcibly as when we say it to "our own selves." And indeed there are few of us to whom it might *not* be said sometimes. But to specify—and first, concerning mealtimes.

Don't let us air grievances, in the form of scolding or complaint, either, at the family table. It is the poorest of all places to vent irritation. If one's own digestion is unaffected thereby—as is unlikely—there are others to whom eating under such circumstances becomes well-nigh impossible.

Don't discuss or mention at table, distressing, disturbing, or otherwise disagreeable occurrences or subjects, or recount details that are in any way saddening, of sickness, death or accident. Indeed, in most cases it were better not to dwell at all upon such particulars or to relate them at length. And certainly such a recital should be prohibited at table.

Don't make mention too often of particulars concerning the food, its price, preparation, and the like. Mr. Emerson's example, as told in that recent and interesting volume, "Emerson in Concord," is a good one. It is said that "he took whatever was set before him with healthy appetite, but hardly knowing or asking what it might be. Rarely he noticed and praised some dish in an amusing manner, but, should any mention of ingredients arise, he always interrupted with 'no! no! It is made of violets; it has no common history', or other expressions to that purpose."

And especially do not allude to the food before you, to food in general, or to anything else, in any way that can affect the most fastidious appetite. Grown people will of course very seldom offend in this way, yet even they sometimes do. And children should surely be taught gentle manners.

Don't let us shorten the meal-hour, always too brief, by hurrying to get cleared away, by comments on the lateness of the hour or the work yet waiting, or sit down with too many evidences of the preparatory work visible either on the person or around the room—the sleeves still rolled up, and the soiled apron unremoved; perhaps, sir, with even your hat still on your head. All these things hinder both appetite and the ease of mind that should accompany it. If we could have a dining-room always! But it is often one of the unattainable things in our country homes, especially in winter. Lastly, "Don't" let us "run in" at our neighbors at meal-time. It is so much better to go earlier or later, and most errands can wait, the friendly chat always.

WOMEN AS WOMEN.

AUNT ANCIENT.

AFTER the last meeting of the Women's National Convention the editor of one of our prominent dailies, asked why some "old-fashioned" woman did not read a paper at the meeting on "Women as Women." A male writer in the Epoch attributed the "rudeness of women," to their "growing independence." A noted journalist writes of women's inaptitude for the duties of a public office; while a correspondent of an educational journal says that "at least one-half of all the teachers in our public schools should be men." Such queries and opinions as these, coming from men of presumably broad views, furnishes another proof of man's inability to regard women as at home in any sphere save the domestic.

To be sure, there are implanted in every woman's heart a love of home and a desire for family ties, but as she advances in intelligence there will be less likelihood of her exchanging the means of an ample subsistence for a home and husband unless the husband be a congenial spirit and one that is worthy of a good home. It is not my purpose to discuss, in detail, the advantages to mankind in general arising from an enlargement of woman's sphere and her increased facilities of obtaining an honest livelihood; neither will I dispute the opinion of men that woman is most lovable when she retains every vestige of true womanliness and figures in the capacity of a sister, daughter, wife or mother. If among the numberless vocations that have been opened to woman there is one that has a tendency to make her less a woman the privilege she has of entering that vocation should be immediately disallowed. No woman can afford to lose the charms of a gentle womanhood, and the more she is brought into contact with men, the greater is her need of those qualities which are essentially feminine. While woman has gained the right to stand upon a social and intellectual level with man, every woman, no matter what her calling may be, has duties to perform and responsibilities resting upon her that belong to her sex alone. Her influence should always be informing and stimulating, her efforts persevering and quiet. If there be any that take exception to the last requirement, let them remember that in no place is a female blusterer ever sanctioned. No quality of mind or habit of life that is distinctively masculine can be tolerated in woman by the opposite sex.

Opposites attract, and all women who are desirous of pleasing men and of influencing their actions will cultivate the graces of a pleasing femininity.

To add to the qualities which constitute woman's innate womanliness, her dress, her manners and her education are deserving of especial attention. "Dress," some one has said, "is an index to character." A woman's dress in particular indicates the degree of her modesty, her refinement, and were it not for what has been said concerning the dress of intellectual women, I would add, her intelligence. Aside from this, I have observed that in proportion to the number of genuinely feminine traits that a woman possesses is her love of neatness and cleanliness in dress increased. It does not argue in favor of a frivolous or shallow mind for a woman to be neatly and stylishly dressed. The intellectual and moral status of the woman who dons a tasteful apparel is several degrees higher than that of the gaudily dressed woman, and I am bound to add that there must be something sadly wrong about the mind or nature of the woman who persistently ignores the most becoming fashions for the sake of showing an independent spirit, or because she has no desire to be considered attractive. Every woman should exercise a daily care in the matter of dress, not only because her self-respect is augmented thereby, but because men, from the most polished down to the most uncouth, love to see their female friends evince a taste for neat and becoming costumes.

When I say that woman craves the esteem and admiration of man, I have in mind the pure-minded woman and the honorable man, and it is not to such a woman's disparagement if she dresses herself to please her lover or husband, or is especially considerate of her personal appearance in the presence of her male friends. The silly sentimentality and extravagance in dress, which characterize some women are to be severely condemned, but the desire to be charming in the eyes of her friends cannot be set down to any woman's discredit. It is a natural, a legitimate feeling and one that is altogether womanly. It has always been a mystery to me how woman can degenerate into an abominable slovenliness, as some do, as soon as they have captured husbands or have little children to love and rear. Surely such creatures lack the qualities which are the distinctive mark of a lovely womanhood.

A woman's manner to a greater degree even than her dress marks the extent of her claim to the title of woman. The manners of a true woman are the reflex of a gentle spirit and a kind heart. They are manifested by a low voice that "excellent thing in woman" and by the unostentatious way in which the truly feminine nature delights to move and act. In direct opposition to her mode of deporting herself is her manner of thinking. The model woman is a vigorous thinker. Her education has been directed to that end and if parents would have their daughters exemplify the beauties of a strong and pure womanhood it behooves them to begin early the work of moral and intellectual development in the minds of their daughters. Every father that has a serious thought concerning the welfare of his country will educate his daughters. The weal or woe of a nation depends in a great measure upon the extent to which its mothers are educated. The work which men have agreed upon as rightfully belonging to woman cannot be accomplished efficiently by the unwomanly, the weak-minded or illiterate of the sex. A clear understanding, a refined manner, a cultivated taste, good judgment and strong moral tendencies are conspicuous qualities of the woman who fulfills her highest mission. Ignorance and a slavish dependence upon men are not womanly characteristics. Women like men have their distinguishing traits and their attractiveness to men is increased in proportion to the prominence which these traits assume. The true woman does not detract from her worth as a woman when she engages in any work to which duty calls her; womankind has not been degraded by the labors of such reformers as Ellice Hopkins, Frances Willard or Lucretia Mott. Men have not found their wives less helpful, homes have not been made less bright or little children less happy because of the interest which women have manifested in politics, literature and the arts, and in the advancement of their own sex.

A discussion of the subject "Women as Women," at the Women's Convention was not a necessity, for every loving mother, every affectionate wife and every tender sweetheart is a testimonial to that truth which cannot be gainsayed. Woman is first, last, and all the time a woman, and as such she longs for no wider kingdom than a home, no stronger sceptre than love, and no greater power than that which she wields over a husband and children.

To have such an ambition a woman need not be "old-fashioned," she need not be a conservative or a domestic slave, for it is an attribute of the highest, the lowliest, the most gifted and the strongest-minded of the sex.

GOLDEN GRAINS.

DR. JOHNSON SAID: Exert your talents and distinguish yourself, and do not think of retiring from the world until the world will be sorry that you retire. He hated a fellow whom pride, or cowardice, or laziness drives into a corner, and who does nothing while he is there but sit and growl. Let him come out and bark.....

IT is said that a clergyman in one of the Bahama Islands proposed that the service be shortened for the convenience of his parishioners. A day or so afterward he received this protest: "Indeed, sir, our ladies will neber tink it worth while to dress only to sit in church for one hour." We wonder if such a remonstrance could come from any other place? Certainly, it would not be heard in this country.....

IN a St. Albans church, on a recent Sunday says the Messenger, a little lad looked on with surprise as the contribution boxes were passed around. He had an idea that the cash was being distributed gratis, and so, just as the box was leaving the pew in which he sat, he put his chubby little hand in among the change and brought out a fistful, and was quite disgusted when his mamma made him disgorge.....

HARPER'S WEEKLY reminds us that it would be well to remember our friends while they are living and not wait until after they are dead before we manifest our appreciation of them.....

IT is an odd thing that no sooner has death claimed our friends for his own than we begin to say and do a multitude of things of little use at all then in comparison to that which they might have been had they come in advance of death. Then out of hand we flock to the house with offers of assistance and proffers of friendship; we rob our gardens and our hot-houses and send cut flowers in profusion, and funeral wreaths and crosses and pillows and anchors and stars to encumbrance and do all we can, though late to hide and disguise and sweeten fate. But if we had flocked to the house while the dead could have been aware of it how much pleasure and excitement and relief from monotonous or lonesome hours our sick friends might have enjoyed when all was a tiresome round of day and night and medicine and solitude, when a bunch of flowers brought in would have brought a light to the dull eyes, of joy both over the gift and the giver, joy which no broken columns of tuberoses and ivies, costing small fortunes, can bring to the eyes of the dead! Even could we have been admitted to the sick room itself, we could have brought there the murmur of the outside world by the mere knowledge given to the patient that we were within the gates, some break, some cheer, some good..... .....

THEN, too, how profuse we are with our good words after their ears are stopped with dust. We do not hesitate then to say all that is true or even more than is true in praise of the departed. It is as if we had suddenly discovered in the sand a jewel fit for kings to wear; we make an outcry and hold it up to the light and turn it this way and that, and exclaim and marvel and admire and call on others to do likewise. There is nothing to say about this person now that the place once filled is vacant. But if we had said a tenth part of it all when it might have been heard by the living person, of how much more worth it had been! What joy and satisfaction it might have given! The subject of it all might have felt as if satisfied to leave life with such appreciation. But it was not spoken, and life went on without it; and now we regret it, and do the same thing over with the next friend..

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"Too little rest, too little sleep,
Too many hours to sow and reap;
At last, disease and pain
The strongest rope parts strand by strand,
Beneath a ceaseless strain."

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

"THE little foxes that spoil the vines." The Song of Solomon, 2:15.

That remarkable genius, Mother Goose, has indited one stanza so pertinent to the every-day affairs of life, that it seems to me it should not only appear in every child's nur

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children she gave them Castoria

sery book, but be graven on the walls of our homes and places of business. Certainly it ought to be graven on the tablets of our memory that:

"For every evil under the sun,
There is a remedy or there is none;
If there be one, try to find it,
If there be none, never mind it."

For if we bore this fact ever in mind, it might help us to tide over the ills of life with less of peevishness and repining, and to seek more perseveringly forthe good gifts which fortune holds in store for us.

The little evils of life are perhaps the ones that are hardest to bear, just as pin-pricks give us more annoyance in proportion than some act of surgery. To the little evils of life, then, we should first learn to apply a remedy or accord a good-natured indifference; and when we are perfect in the art of meeting small ills philosophically we shall be very apt to meet the larger ones with equal fortitude and serenity.

And this discipline should commence in childhood. Girls and boys need to learn early that they must expect tumbles, and bruises and knocks and hurts, and to endure them with stoicism. You will never find a child develop into greatness which was eternally coddled in its youth. Too much sympathy and concern expressed about every tiny bruise and ill make children babyish and peevish; they blame the earth for hurting them, the furniture for knocking them, the sun for making them hot; and they grow up into fault-finding men and women, inclined to sulk and grieve over every little trifle, instead of seeking their remedies, or taking them as they come with a smile.

How many of us have seen the woman whose brow has been clouded for hours at the upsetting of a goblet of water, or tracks of mud on the carpet, and the man who has darkened and flashed like a thunder-storm because dinner was a quarter of an hour late, or a button was off his shirt?

I doubt if there is a household to which Mother Goose's admirable lines might not teach a lesson, if there is an individual who might not profit by a frequent refreshing of the memory concerning them. It is an old axiom, and a true one, that there is no use in crying over spilled milk. If there is any way to be devised by which the spilling of milk in the future can be prevented, why set to work and devise it. Do all the cross words in the dictionary and all the frowns which the human countenance is capable of putting on undo the evils which befall us?

Do our exclamations and the ugliness we display to all with whom we come in contact, sew rents, mend breaks, get the meals on time, restore lost articles, or alter the state of the case whatever it may be?

If they did, there might be some satisfaction in our cross words and ugly looks, but how many of us looking back upon the expressions in which we gave way to our feelings, do not remember something we wish we had left unsaid?

Then why not "never mind" the little accidents which are trying but irreparable when once they have occurred, and make efforts to guard against their recurrence in future?

Drive in the projecting nail, and it will not tear your frock again; hold your delicate china more firmly next time; tell your wife to begin her preparations for dinner a few minutes sooner, etc. As to fretting against the weather, we all know that no amount of worry or execration is going to clear away the clouds one minute sooner; and we only succeed in having cloudy weather inside as well as outside. Those people who are impatient and irritable, who fly into a passion or sink into the sulks every time a trifle annoys them, resemble nothing so much as grown-up babies, and there is no end of these grown-up babies in the world, both masculine and feminine.

Every life has its evils, both big and little. Is it because there is not enough unhappiness in the world that we must magnify the small ills? Why not try to get the most enjoyment instead of the most unhappiness out of life?

It is "the little foxes that spoil the vines." So it is the constant worrying over little things that spoils our lives, that robs us of half the enjoyment that, I believe, we were intended to draw from life; for I don't believe God put us here to be miserable, except through our own wrong doing, Adam and Eve notwithstanding. Instead of making ourselves, and everybody around us, uncomfortable whenever we tear our clothes, break our china, get a reduction in salary, see our neighbor wear a better suit than we can afford, or are beset with any similar evils, we will just call to mind that bit of wisdom: "It is the little foxes that spoil the vines," and resolve with heroic philosophy to "never mind."

TALKING of the various ways in which different people affect us, a guest made the remark that after the visit of a certain friend she always felt as tired as if she had worked from six o'clock in the morning until nine at night.

ODDS AND ENDS.

BEAUTIFUL and artistic portières for doorways (or curtains for windows) are made from silk rags, woven in the same manner as ordinary rag carpets. If regular stripes are desired, the rags may be sewed to give that effect, but if they are put together "hit-or-miss," or just as they come, they will produce a sort of Turkish or Persian effect. To my mind, this is far prettier than any set pattern could be.

THE best salad dressing is, to my taste, a French Mayonnaise, pronounced Mah-younaze. This is said to have been named in compliment to a French noble, the Duc de Mahon, and was first called Mahonnaise. The following is according to J. W. Parkinson, the celebrated authority on such matters. Take the following ingredients: One pint of olive oil; the yelks of three eggs; one pinch of powdered bay leaves; one pinch of white pepper; two table-spoonfuls of vinegar; two table-spoonfuls of lemon juice.

The eggs must be *freshly laid*, and every drop of the white carefully separated from the yelks. Put the latter into a soup plate or shallow bowl and set on a large dish containing ice; add the spices and stir steadily round in one direction until the paste is entirely smooth and ceases to thicken, using a box-wood fork for the purpose. Then add, very slowly, in a fine stream, half a pint of olive oil, then the lemon juice, another half-pint of oil, and, lastly, the vinegar, stirring steadily and briskly in one direction, during the latter process until the sauce thickens no longer. Then set into the ice-box till wanted.

If all the materials are of the best quality and skillfully worked, the sauce should resemble in body and color, a rich, boiled custard, and fall from the spoon in a thick mass. More oil can be worked into it, but it would be too rich for many tastes. This result will vary somewhat with the temperature, and the quality of the ingredients; but the proportions named are as nearly correct as possible.

MRS MEAD, a California woman, prefers plowing to housework, so last fall she hired a girl to do the indoors work, while she herself took charge of a four-horse-plow. She and her husband between them put in 230 acres of wheat, and they are mutually delighted with the experiment.

THE following is a cooling ointment for sun-burns, etc.: Elder flowers, two pounds; lard, two pounds; simmer till crisp and strain. Apply on retiring, or several times during the day if you can do so. This will be found to greatly benefit the complexion during the summer months. Now is the time to gather the elder flowers, as they are in bloom. You need not make the full quantity as above, but half or a quarter of the amount. But the flowers can be obtained only *once* a year, so I think it best to make enough to last for some time.

ELDER flowers also make dainty fritters. Gather a quantity of pure, white, full clusters of the blossoms, shake them free from possible dust or insects, have your batter (made like ordinary fritter or cake batter) ready, drop a fritter into the pan, which must be hot and covered with melted butter, then dip the flowers into the fritter and cut the stems off. As soon as brown turn. You may sweeten the batter if you prefer. Serve with sugar and cream, or eat with butter alone. There is not much stability about these, but they are exceedingly dainty, and make a nice little delicacy for a meal.

D. H. V.

BLACK CURRANT JELLY FOR SORE THROATS.

A RECENT guest spoke highly of the soothing qualities of black currant jelly for throat diseases. Put a small quantity of the jelly into the mouth and let it dissolve slowly. Our guest mentioned several instances in which, if a cure was not effected, at least great relief was obtained from this simple remedy. For her own use she cuts the firm jelly into small tablets, rolls them in sugar and lets them harden.

COVERS FOR JARS, ETC.

A VERY convenient cover for a jar, pail or other dish in which one wishes to store pickles, sauces, cookies, fried cake, meats, etc,, is made by taking a square of board large enough for the utensil to be covered, plane and cut off the corners so that it will be less liable to be in the way; then on the under side put a smaller piece of the same shape or just a long or square piece as most convenient, only small enough to go inside of the jar, and you will have a cover that will be in no danger of breaking, and one easily cleaned. We have used them 10 or 15 years and they are just as good as when first made, and if we happen to want an extra supply of pie-plates we do not have to ransack the cellar for them. It is well to make smaller ones for the gallon jars as they take up less room.

C. R. DAVIS.

DINING-ROOM NOTES.

"THERE are so many ways to use cream," said Mr. Smith as we sat around the dinner table, "besides the prime one of butter making." It is often an ingredient for all kinds of pastries, and during the small fruit season it is occasionally pressed into service, but more often milk is used and that is what curdles in the stomach and so often causes distress. Next to peaches, there is no more delicious dish than mellow, juicy apples, chopped fine and well buried in thick, sweet cream and sugar. If the apples are sweet only a little, if any, sugar is needed.

HAM, nicely fried, is greatly improved by pouring sweet cream over it and setting the dish in the hot oven a few minutes. Prepared in this way, it is very appetizing and the gravy makes a delicious dressing for potatoes and bread.

CRISP lettuce with cream and vinegar is very fine. Pure cream does not curdle in the vinegar. Creamy milk may do very well for tea and coffee, but does not fill the bill, to mix with acids.

A TEACUPFUL of cream improves the flavor of asparagus, peas, beans, etc. It is also a good addition to chicken gravy, and, used with sugar, makes an excellent dressing for puddings.

A Cow may eat her head off twice through the winter for aught I know; but, comparatively speaking it is a very slim living a farmer has without at least one or two good cows on the farm. The surplus hay might be sold perhaps for more money than the cows would bring in market. But it would never be used to buy cream, whatever else it might get, and cream and milk are luxuries fit for a king, and none too good for the kings of agriculture.

THE farmer who does not know the taste of cream, has got to learn that it is far more to be prized than honey in the honey comb. So don't put all the cream in the churn, to be made into butter to be packed away, to be sold next winter when it has, in all probability, become "just a little strong;" but enjoy the delicious flavor of it now while it is in its prime.

OLD potatoes are wonderfully improved in flavor and appearance by having them pared and thrown into cold water several hours before cooking. Then, if they are put into boiling water and kept boiling till just "done," and then drained immediately, they will be as white and "mealy," as when first dug in the autumn.

The Aged

Who need help in their many infirmities, especially those afflicted with rheumatism, find great relief in

AYER'S Sarsaparilla.

"One year ago I was taken ill with inflammatory rheumatism, being confined to my house six months. I came out of the sickness very much debilitated, with no appetite, and my system disordered in every way. I commenced using Ayer's Sarsaparilla and began to improve at once, gaining in strength and soon recovering my usual health. I cannot say too much in praise of this well-known medicine."
—Mrs. L. A. Stark, Nashua, N. H.

Ask your druggist for

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.

Price $1; six, $5. Worth $5 a bottle.

BEECHAM'S PILLS

News of the Week.

HOME NEWS.

SATURDAY, July 6, 1889.

UNFORTUNATE Conemaugh! The other day a fire destroyed a large part of the houses the great flood had wholly or partly spared in Johnstown, and during the week enormous downpours among the neighboring mountains have flooded the valley, the water rising high on the first floors in the houses in Johnstown, destroying or damaging all the furniture saved from the big flood. Business is sluggish, and there's a world of discontent and grumbling at the distribution of the marvelous relief fund contributed by the liberality of the nation. Nearly two-thirds of the fund is still in charge of the depositaries where it was raised; over $325,000 of the $510,000 raised in New York City remains here yet. At all the great collecting centers contributions are still coming in. Those received here during the week averaged about $675 a day. It is proposed to have 1,000 houses made in Chicago, put them up in the valley, furnish them plainly and donate them to the needy. The number getting relief is steadily being cut down, as employment gives support. The sufferers want lump sums, and many who are in no real need insist that their losses should be made good, in part at least; but the managers say the money was given to relieve distress, not to compensate for losses.....

An English syndicate is buying up the shoe factories of Massachusetts, and another is negotiating for the purchase of the flour mills of Minneapolis. English capital at home is content with from 2½ to four per cent. interest; it can make much more than that by directly controlling American manufactures, especially when it is done "trust"-fashion. There's too much wealth and enterprise, however, in this country to permit any of its large industries to be monopolized or wholly controlled for any length of time by non-resident aliens.. Canadian millers in mass meeting at Toronto are about to protest against the refusal of Parliament to protect them against competition with American millers. The import duty on flour is 50 cents per barrel, while the duty on the amount of wheat necessary to make a barrel of flour is 67 cents—a discrimination of 17 cents per barrel in favor of American millers..... Sir Julian Pauncefote, the British Minister, has just bought a small farm outside the limits of Washington City, and will raise his own farm supplies and garden "sass"..... One man claims $300,000,000 worth of San Francisco under an alleged old Mexican grant; while another will be content with $2,000,000 worth of St. Paul, under a newly resurrected or invented real estate claim.....

The Dominion offers the "States" a reciprocity in lumber. It wants 60,000,000 American customers in exchange for 4,500,000 Canadian customers.....Fred Douglass has been appointed Minister to the colored Republic of Hayti. The struggle there between Hypolite and Legitime is still going on, though the latter's authority is confined to Port au Prince, a straggling town of about 17,000 inhabitants. .....The Old Star Route cases against Steve Dorsey and others have at last been "nolle-prossed" at Washington. That's the last of the scandal.....G. W. Wright, of Philadelphia, Supreme Treasurer of the Mutual Insurance Order of the Tonti, and also connected with the Pente and Iron Hall, is $40,000 short in his accounts with the Tonti. The order is reported amply secured by bonds of several surety companies. Trusted officials are the greatest dangers to such associations. ..... Carlotta Patti, elder sister of Adelina, and nearly equally famous as a singer, is dead. So is Maria Mitchell, lately of Lynn, Mass., probably the greatest female astronomer that ever lived ..Prairie fires—the most extensive ever known in Montana—have burned over 100 square miles in Canada county.... The tenth annual meeting of N. Y. French-Canadians was held in a large hall in this city Monday. The object was to urge F.-C. to become American citizens while still retaining their own language. The advisability of annexation was also discussed, and the general sentiment was in favor of it.....The amount of money that can be sent from this country to Germany, or the other way, by money order, has been increased from $50 to $100.....Much to the indignation of the natives, Mormon missionaries are working quite successfully in several parts of West Va., especially in Ritchie county.....

The License Courts in Pennsylvania have enormously cut down the number of liquor stores, but their work will be seriously affected by a decision just rendered by the Supreme Court, which has ruled that they have no power to refuse licenses to brewers, wholesale liquor dealers and bottlers, if they are of good, moral character, temperate and American citizens. Owing to this decision 229 persons to whom licenses were at first refused, have just secured them in Philadelphia alone. .....Another strike among the Pennsylvania coal miners! They can make only 90 cents a day, and want five cents a ton more. Over 12,000 men are out about Altoona, and more are going out unless their demands are granted..... ..Theodore Dwight Woolsey, D D., LL. D., for many years President of Yale College, died at New Haven, Conn., Monday, aged 88 years.....The sickly green two-cent postage stamp is to go ..... The government has contracted for 550,000 enameled bricks, to be used in the construction of the Congressional Library. Can't such bricks be made at home? The government pays no import duty..... Durango, a place of 5,000 inhabitants, in Southwestern Colorado, was almost entirely cremated Monday.....

After the failure of the great strike on the Reading Railroad somewhat over a year ago, President Corbin issued an edict that no men belonging to the K. of L. or any other labor organization would be employed on the road or in the coal mines and works under its management. Since then 60,000 men have quit such societies, and not a man in the company's service to day belongs to one. Then the company organized a "relief society," the dues to which average $2 per head per month, ranging from 75 cents to $4, according to the employé's position with the company, and the men got a hint that it was the safer plan to join it; those who failed to take the hint, were quietly dropped. The company receives each month nearly $60,000, or $720,000 a year, as dues from the relief society and acts as banker, while its officers manage the society's affairs. It has its own sweet way just now, but many of the employés are secretly kicking..... The total reduction on the public debt from June 30, 1888 to July 1, 1889, was $88,182,200, and there still remains a net surplus of upwards of $50,000,000 in the Treasury..... At the Fall River cotton mills there have been chronic strikes of late, as the cotton lords jewed the hands down to starvation wages on the ground that their business was unprofitable. Now they are declaring unusually large dividends ..... The Sullivan-Kilrain fight is billed to come off next Monday somewhere within 200 miles of New Orleans, and both men have arrived in that city in the "pink of perfection." The Governors of Louisiana, Mississippi and Alabama have issued proclamations forbidding the fight within the borders of those States, and the Governor of Mississippi has offered a reward of $1,000 for the arrest of the principals should they disregard his prohibition, and secured from the other two Governors permission for Mississippi troops to cross a part of the States, if necessary, to prevent the outrage. The betting now is strongly in favor of "Boston's Pride," though the "Baltimore Pet" has hosts of backers. The odds in favor of the "Big 'Un," however, vary from $100 to $50 to $100 to $80. The newspapers are giving columns of news space to the fullest details of the preliminary preceedings, and have made ample and very expensive arrangements for full reports of the "mill," while their editorial columns bitterly denounce the brutality of the whole thing! Who'll win? Well, doubtful things are mighty uncertain. ..... Mrs. Anna Pickett, widow of the gallant Confederate General George E. Pickett, who led the famous charge on the last day of the battle of Gettysburg, is to marry General James C. Lynch, of Philadelphia, who was Colonel of the 106th Pennsylvania Regiment which formed part of the first brigade which met the charge of Pickett's men. They first met on the Gettysburg battle-field a year ago during a reunion of the Blue and the Gray. He is now a well-to-do builder of 57, and she a very handsome woman of 50, who has been a clerk in the Pension Bureau, at Washington, ever since President Grant appointed her after her husband's death..... The Cronin murder case still drags ineffectually along in Chicago. There are reports that two or three other members of the Clanna-Gael who shared Cronin's opinions with regard to the rascality of the "triangle," or three directing spirits of the organization, have also shared his fate; while several others in different parts of the country are afraid for their lives, threatened by the patriotic thugs. Just at present everything is "pending."..... Oklahoma City, which had no existence two months ago, had a grand Fourth of July celebration, attended by hundreds from the surrounding country. The grand stand broke down under their weight, and 10 were killed and over 100 more or less seriously injured..... ...The Glorious Fourth was well celebrated everywhere except where heavy down-pours wet-blanketed the festivities. About the usual share of deaths, maimings and conflagrations are reported as among the results of the general rejoicing.....New York's present area is only 26,000 acres; Philadelphia's 82,000; Chicago's 111,360!!! ..... Last Saturday the Michigan legislature passed a secret ballot law at general elections. Tickets are to be printed by the State, of uniform size, color and texture. A railing and gate in front of each polling place, with a gatekeeper who shall admit but one voter at a time, are provided for in the law, and also the construction of booths in which the voter may prepare his ballot in secrecy. This is substantially the Australian voting system which so many of the States are adopting ...

... The value of taxable property in New York City in 1888 was $1,553,442,431; the commissioners say it now amounts to $1,603,839,113 ..... In preparation for a big show at the Census, Chicago, has just annexed Hyde Park, Lake, Lakeview, Cicero and Jefferson, making an addition of about 300,000 to her population, bringing the total up probably to 1,100,000. Her area now is 174 square miles—by far the largest area of any city in the country. It will now be in order for St. Louis to annex about half of Missouri..... Captain Dawson, an earnest, whole-souled man, editor of the News and Courier, Charleston, S. C., had made his paper second to none in the South, but as he was outspoken against humbugs, frauds and Bourbonic old-fogyism, as well as against super-exaltation of the "colored man and brother," he made lots of enemies, while he had hosts of friends. In his family, as governess to his children, was a very handsome and smart young woman, whom his wife had brought from Switzerland a couple of years ago. A Dr. McDow, a married man with a child, made love to the girl, and tried to induce her to elope with him. Some weeks ago Dawson called at the Doctor's office to remonstrate against the latter's persistent attempts to corrupt the governess of his children. He had on a heavy overcoat, and carried only a light six ounce walking cane, while his gloves were on—little appearance, therefore, that he expected a fight. The Doctor shot him dead "in self-defence," and tried to hide his body by burying it in a cellar closet. While he was in jail awaiting his trial, the crack artillery organization in the State spontaneously elected the murderer as member of their chivalrous ranks. The negroes had been down on Dawson on account of some of his writings, so seven negroes and five white men were put into the jury-box to decide the fate of his slayer. The only living person who knew the facts of the murder was McDow, and his life depended on the way he told of it. The jury believed him, or pretended to do so, and acquitted him, "amid the wildest applause." The general impression, however, even in his own State, is that he is a foul murderer, who may yet meet the doom he has just escaped by a political jury verdict.....

At 1:20 Tuesday morning a mile west of Thruxton and 30 west of Lynchburg, Va., an accident on the Western Division of the Norfolk and Western railroad, caused 34 deaths and more or less serious injuries to 93 others. A heavy 24 hours' rain had caused a washout 80 feet long and 50 wide, over a gulch in which the water was 10 feet deep. Into this the engine, running 30 miles an hour, plunged, carrying with it the tender and eight cars, leaving only the last of three sleepers on the track. The locomotive boiler exploded scattering burning debris all around. These set fire to all parts of the train not submerged in the gulch, and even the last sleeper was cremated .....

Encouraging.

Here is encouragement for those afflicted with that terrible scourge—*Nervous Prostration.*

"I was induced by a friend to try your Compound Oxygen Treatment. The result was marvelous. I will always recommend Compound Oxygen as the greatest vitalizing agent known for I certainly find that it has prolonged my life." MRS. E. H. HENDERSON.

As you are aware we publish a brochure of 200 pages, containing the full history of Compound Oxygen, and a record of cures in many interesting cases. It will be sent free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa; or 312 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, July 6, 1889

AFTER all, the United States make only a despicable show at the Paris Exposition. The exhibit of cereals from which so much was expected, wouldn't do "much credit to a county fair." Other departments are on the same miserly scale. Much of the blame is attributed to the inaction of the Commissioners who are gobbling up a good share of the appropriation in salaries and expenses. But, then, the United States have never made a good show at any European Exposition. Manufacturers haven't much of a foreign market, and don't seem to want more. The Exposition is a grand success, however. During the last 14 days of June upwards of 2,000,000 visitors passed through the wickets. In every respect it's the finest thing of the kind ever seen. Probably the greatest attraction is the 1,000-feet-high Eiffel Tower which commands a view of 35 miles all round the horizon ..... The Princess Louise, eldest daughter of the Prince of Wales, has just been engaged to the Earl of Fife, about 40 years old, rich and moderately popular. Englishmen are jubilant that Europe has not been ransacked for an eligible princeling for the royal princess..... Prince Albert Victor, eldest son of the Prince of Wales, has become engaged to his cousin, Princess Victoria, of Prussia, sister of the Emperor of Germany. It was at first thought that the Queen would make an ample settlement on him out of her large private accumulations; but the House of Commons has just received a message from her asking an extra provision for him in addition to the $30,000 a year he now receives from the people's pockets. ..On the southeastern coast of Africa, stretching from Zululand northward, for over 1,000 miles, to the Zanzibar Coast, is a rather narrow strip of territory belonging to Portugal, the northern part of which is known as Mozambique. At its southern end, about 75 miles from Zululand, and 54 from the Boer Republic of Transvaal, is Dalgoa Bay, the largest town in the territory, and the finest harbor on the eastern coast of Africa. Stretching for 500 miles along the west coast of Africa, opposite Mozambique, are the two settlements of Angola and Benguela, also belonging to Portugal, which claims the intermediate region, from 1,100 to 1,500 miles across, by right of prior "discovery and exploration," though nothing has hitherto been done to "improve" either, as the country is almost entirely unknown. The head-waters of the Zambesi river which empties into the Mozambique Channel about the middle of the Portuguese east African possessions, take their rise not far from her western possessions. England has pushed her encroachment as far north as the Portuguese possessions on both the east and west coasts and in the middle, here and there, as far north as the Zambesi, omitting the Transvaal, and is very anxious to get hold of Dalgoa Bay. Some time ago Portugal granted to some English capitalists the right to build a railroad from Dalgoa Bay to the Transvaal frontier—50 miles away—where it was to meet another road, 250 miles long, running through the Transvaal to Pretoria, the capital, and thence to the gold and diamond fields farther west. Owing to an alleged infraction of agreement, Portugal has just seized upon the nearly completed road, to the intense indignation and wrath of all England, and although Portugal has agreed to leave the matter to arbitration, England has sent three ironclads to Dalgoa Bay. She scouts Portugal's claims to the connecting belt in Central Africa, but the claims are countenanced by Germany and France..... Lately a small fire occurred in the Imperial palace, Pekin, China, and the astrologers at once declared it was due to the recent introduction of a distant railroad system. Hence an anti railroad scare and stoppage of the work. The fright is passing off, however, and in spite of popular opposition railroad construction is likely to be continued, as the control of the roads of the northern provinces has been placed in the hands of Li Hung Chang, the leader of the progressive element in the Flowery Kingdom..... The new Japanese constitution modeled on a European basis of representative government, was promulgated a few months ago. The freedom of the press and full liberty to adopt "Western" fashions are among the concessions. The ladies of the Court and the higher classes at once began to follow the Parisian fashions, and reaction has just set in. The followers of the "old school" at once began to guy the novel dresses, and public ridicule has compelled the ladies of the Court and most of the others to return to their time-honored habiliments. The railroads, telegraphs and other modern improvements are still popular however..... Like England, Switzerland has long been a refuge for political conspirators and malcontents of all sorts, but being in the heart of Europe instead of on its outskirts, the Swiss refugees are more dangerous to European monarchies than the English. Germany a few weeks ago, led off by strongly protesting against the toleration extended to them. Subservient Italy and Austria, of course, followed, and autocratic Russia, galled by Nihilists, joined the trio. Little Switzerland boldly said she would not permit the refugees to act illegally against her neighbors, neither would she tolerate outside interference with her internal affairs. There's a German threat that it would be mighty convenient to partition her between Germany, Italy and France, each getting the cantons in which its language is spoken. Italy would thus be compensated for the loss of Savoy and Nice to France; and France for the loss of Alsace and Loraine to Germany. Germany would "rectify her frontier" more satisfactorily, while she and Italy would be brought into direct communication, as their territories would adjoin, forming a dividing rampart between Russia and France from the Baltic to the Mediterranean .....

MACHINERY DEPOT.
A full and complete line, from the hand-machine up to the largest, of the **Smalley Cutters,** the **fastest cutting, strongest, most durable** and **best** ever built, including **Carriers,** both straight and angle, of any length required, and **Extras** and **Repairs** of all kinds, constantly on hand. Having the **exclusive** control and sale of these Cutters and all the appliances for the same, for all of the New England States and a large portion of the entire East, together with the right to sell in nearly all the Southern States, application for illustrated, descriptive and free pamphlet, showing **"why ensilage pays;"** and for free catalogue of both **Tread** and **Lever-powers, Threshers, Wood Saw-machines, Feed-mills** and **Fanning-mills,** should be made to the undersigned, proprietor of the old and reliable Empire Agricultural Works, over 30 years under the same management. **Agents wanted,** and **special prices given** for introducing in new localities. Address
MINARD HARDER, Cobleskill, N. Y.

AGRICULTURAL NEWS.

SATURDAY, July 6, 1889

ACCORDING to a correspondent of Bell's Messenger, no one section of the Paris Exposition possesses greater interest to British farmers than the one devoted to the agriculture of the United States. The work of grouping the many and varied objects of interest and study in this collection involved much patient care and discrimination on the part of the American commissioners, and the results achieved reflect credit alike on the commissioners and the country they represent. Upon entering the United States court at the east end the visitor sees a display of forest products from the great lumber regions of the States. These are exhibited in various stages, from the raw timber to the manufactured product. Associated with this display is a model of a tree-planting machine of great merit, the machine itself having been proved capable of planting as many as 8,000 or 10,000 trees in a single day. Close at hand is seen a valuable series of wall charts, illustrating in graphic form the economic features of cereal cultivation, agricultural education, railroad development, and subjects of allied character. A collection of cotton fiber products includes a large number of specimens of raw cotton, cotton seed, cotton-seed cake and oil, and cotton-oil soap. Adjacent to this exhibit is a variety of specimens of flax, jute, and of the ramie fiber grown in Texas. Next is a collection of the wools produced in different parts of the Union by the various breeds of sheep at present in favor with American farmers. The native fruit industry is illustrated by an exhibit comprising raisins, oranges and nuts, models of apples, pears, and other cultivated fruits, and a series of American wines. At the other end of this court the surroundings are chiefly corn and honey. The grain exhibit is almost bewildering in the number and variety of products. In one case alone there are upwards of 250 varieties of seed grains—"corn" or maize in every conceivable form, from all the principal grain-growing regions of the Union. An instructive collection of prepared food-stuffs includes pearl hominy, yellow Indian meal, crushed wheat, rice, and rice meal. A remarkably fine exhibit of hops is appropriately flanked by a series of bottles of American beer. The honey collection includes honey in every known form, a series of bee appliances, and the packages in general use for shipping and marketing the products of the hive. The very beautiful display illustrative of the economic entomology of the United States, prepared by Prof. Riley includes specimens not only of useful insects, but of the many insect pests, including Hessian fly, army worm, Rocky mountain locusts, and numerous others which annually inflict enormous loss upon American farmers. The specimens are shown in conjunction with specimens of the plants which they attack in order to indicate the nature of the injury, and to suggest remedial or preventive measures. The exhibit of vegetable products includes preserved sweet corn, grown for table use, tomatoes, peas and other vegetables, bottled or canned. Forage plants and grasses are presented in a collection of great variety and interest, and while the grasses include a few forms known in British agriculture, most of them are of a characteristic American type. The silk industry is not overlooked. Illustrations are afforded of the various stages of manipulation through which the raw material passes, and there are shown 64 specimens of cocoons produced in the United States, including several specimens of a cross-bred race, raised with no outcrossing for 18 years A carefully made selection of tobacco products from Virginia, Kentucky, Connecticut and Maryland serves to show what perfection the tobacco industry has attained. A small group of sugar maples and sorghum plants will remind the continental cultivators of sugar-beet that their industry is one that has not escaped the competitive instincts of American enterprise. A large collection of cut meats, lards, hams and canned products from Chicago packers and well-known houses in the Eastern States bears testimony to the efforts that are being made to secure for the States a world-wide trade in the animal produce of the prairie and the corn field. A number of very graphic charts and maps indicate the growth and development of this industry from 1810 to 1884, and give the numbers of animals and their values in periods of five and 10 years. The dairy display is included in the animal products exhibit, but is not yet complete. The cheese and butter exhibits will be contained in a refrigerator, constructed for the purpose. The butter has been selected with a view to the development of European trade, but it will include a number of small packages, such as are used for the home trade in the States. In connection with the dairy exhibit is an ingenious working model of a creamery operated on the cream-gathering system as usually practiced by American factory butter makers. ..... The agricultural implement department is included in a separate section..... ..State Dairy Commissioner Brown has under consideration what steps are necessary to be taken to enforce compliance with the law passed at the last session of the New York legislature to prevent deception in the sale of vinegar..... .....Prof. Snow of the Kansas State University, says that a disease has made its appearance among chinch bugs, which is thinning their ranks rapidly. He terms the disease white fungus, but many entomologists call it chinch bug cholera. The disease is very contagious. Prof. Snow shut up a number of healthy bugs with a few dead ones and they all died in a few days. Prof. Snow says any field can be cleared of the bugs by scattering a few dead ones therein. The disease is prevalent all over the West..... Farmers from different parts of Iowa report that a strange insect is at work in the corn fields. It is a small green bug, which works at the root of the corn, and destroys its vitality. The ground in some fields appears to be fairly alive with the pest..A black beetle half-an-inch long with a snout one-third of its length and known to entomologists as the sculptured corn curculio, is ravaging the growing corn in New Castle county, Del..... The Connecticut State Agricultural Society will hold its 20th exhibition at Meriden park and town hall, September 17—20. Very liberal premiums are offered for "speed," and ordinary ones for agricultural products. W. F. Andros, secretary, East Hartford..... The 10th Annual Fair of the Sussex County Agricultural Society, will be held at Newton, N. J., September 10—13. In the Premium List are given the points of excellence of the different breeds of cattle, together with the scale of points used in judging. The society offers comparatively liberal premiums, but those offered for "trials of speed" overtop them all. Among the latter, however, is a new feature, a purse of $100 guaranteed for the fastest-walking farm team, single half-mile dash, to be driven to a common farm wagon..... Gov. Hoard has appointed W. C. Thom of Beloit, Dairy and Food Commissioner of Wisconsin..... The Buffalo fly is said to have made its appearance in New Jersey, two fatal cases having occurred in one herd. This is a common pest in low, swampy places in the South, but so far as we know, has not before appeared so far north.....The Agricultural Department has sent out an expedition through the Southwest to collect specimens of wild fruits, grasses and grains of that region. .....A beef-skinning contest at Springfield, Ill., was won by a Springfield butcher in six minutes, 57 seconds.....The Nebraska State Horticultural Society meets at Fremont, July 17—18. An interesting programme is promised .....Farmers of the State of New York held a preliminary convention at Rochester, N. Y., on July 3, to arrange for a State Convention, the object of which is to adopt means to increase taxation on personal property, and shift it from the land. Knights of Labor were invited to send delegates with a view to uniting the farmers and Knights in an aggressive movement..... .....Oscar O. Gibbs, formerly editor of the Farmers' Review, of Chicago, died at Kenosha, Wis., recently of paralysis..... Secretary Rusk has made the following appointments; Thomas Taylor, Massachusetts, Microscopist, $2,500; George Vasey, Illinois, Botanist, $2,500; H. E. Vandeman, Kansas, Pomologist, $2,500.....

Crops & Markets.

SATURDAY, July 6, 1889.

HERE AND ELSEWHERE.

THE winter-wheat harvesting line has advanced as far north as Ohio and Indiana, and the crop as a general thing seems to be quite satisfactory. Spring wheat is not so promising, while corn is very backward. There is plenty of old corn reported in the West, though but little of it seems to be coming into market.

The butter market is weak, with no prospects of higher prices. The receipts at this market have been very heavy, and the bulk of the stock has gone into cold storage. There is little prospect for advanced prices for some time to come, unless for the best grades. The Utica cheese market showed a decline in prices, but the quality of the offerings was good. The price ranged from eight to 8¾ cents. At Little Falls the ruling price was 8¼ cents, Prices at the other markets in Northern New York ranged from 8⅛ to 9⅛ cents.

The New York hop yards are reported as looking fairly well.

THE FRUIT MARKET.—This city is well supplied with all kinds of fruit both tropical and home-grown. Strawberries are on their "last legs," and with the abundance of other fruits, go slow at low prices. Raspberries, blackberries, huckleberries, currants, gooseberries, cherries are very plentiful. As usual, the best grades sell at good prices, but poor fruits are a drug on the market. The presence of early yellow Crawford peaches is a novelty at this early period. Georgia furnished the supply. California will send a similar variety shortly. Some California apricots and peach plums, 818 boxes and 160 boxes respectively, were sold by auction Wednesday. The apricots brought $1.15 to $1.70, and the plums $2.35.

The price of beans has jumped up on account of light arrivals.

Sweet corn has made its appearance. Other vegetables are in full supply.

LATEST MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, SATURDAY, July 6, 1889.

A NEW TREATMENT FOR MALARIA.

THE increasing difficulty concerning help in this portion of New Jersey is yearly assuming greater importance. Out-of-doors and in-doors there is an evident deterioration of quality of the help employed. Several causes combine to render such an opinion justifiable. Our help is chiefly of a colored variety. The love of applejack interferes sadly with the sobriety and reliability of the males, while the younger females evince an indisposition to work, that is trying to an ambitious housekeeper. Of course, this charge does not include all, but there is an average growth of the objections referred to, which is greatly to be regretted. In consequence of this condition of things employers find it to their advantage carefully to cultivate the virtue of patience, and exercise a calm resignation to the inevitable. A mental obtuseness to the failings of our employees may also be profitably practiced, although from a strictly moral point of view perhaps it is not to be recommended. A few generations back the ancestors of our colored population were slaves. It may be safely assumed that if their forefathers were abused by the early slave-owning settlers, their numerous progeny are now amply avenging the fate of their suffering sires on the heads of their present employers. A few antiquated specimens of native Jerseymen still survive as day laborers, but from obvious causes their number is yearly diminishing. The blacks fill the chief requirements in the house and on the farm and their follies or their virtues, such as they are, crowd hard on the white laborer. Slowly he has ceased to compete and has either given up the ghost entirely or gone to more congenial soils or social environments. A few Italians are creeping in. At first the advent of these human ants was viewed with disfavor by the farming community. No depleted hen roosts or traditional resorts to the knife or dagger have been recorded, and now they are not an unwelcome alternate with the darkey. As yet, however, they are a large minority and Cato and Julius and their confreres have comparatively undisputed sway.

The superstitions and reverential belief in the mysterious power of charms and spells still maintains as vigorous a hold on the mind of the average African-American as it did on the minds of his savage ancestors. Perhaps it may not be so aggressive and dangerous, but it is there, nevertheless. Those yielding to such folly may be church members in good standing; they may be the loudest shouters for Christian glory and, withal, sanguine candidates for the straight gate, but a rabbit's foot when properly wrapped in red flannel, with a few hairs of a black cat, the claws of a crow and toe of a toad, with some other equally potential mediums, will invoke an influence for good or bad that all the strength of the church may not equal. Especial confidence is felt in the evil effects of spells, which the bad-minded and vicious are able to cast on their victims. Fortunately it often happens that the neighborhood affords some happily endowed person who can impose a counter charm or so advise a remedy as to down the evil spell or prove an antidote for dangerous cases.

The following tale of horror that a colored neighbor related to me on the subject of "black art" will serve to illustrate the state of tribulations from the machinations of an old woman, which he was firmly convinced had been practiced on him and from which he was still suffering. I have endeavored to give it in the dialect that the excited patient used most of the time when telling his troubles. The fellow was several degrees removed in intelligence above the average colored day laborer. He was the owner of several acres of ground, a neat little cottage, a horse and wagon of which he was modestly proud, a cow, and numbers of other little comforts that combine to render a darkey's heart a light one indeed. Although the snows of 74 winters have whitened his kinky wool, yet they have shown little inroad on his well-knit frame and Cato's services are in active demand by resident farmers who want a good day's work done. He had recently suffered from what was doubtless an attack of malaria superinduced by working near low and marshy ground. Not appearing as usual about his house for a few days, I stopped one morning to learn if his illness had taken on a serious turn. I found him stretched on a "shake-down" close by the hot kitchen stove. He partly arose as I entered with: "Boss I'se 'bleeged to yo' fur comin' to see a pore sick man, but I'se better'n I was, yes I'se good deal better; in fac, I'm jess finishin' off gittin' well. I'se had a doctor, leastwise I call him a doctor; doan [spec white folk would say he was a doctor, but dar's sometings white folks doan b'leeve and curous 'nough dey can't be made to b'leeve nuther, but cullud folks knows dey is true.

Has he holped me? You jess bet he holped me; he's 'bout done cured me."

"What did he do for you, Cato?"

"Dat's it now, boss; dat's it, 'twould'nt do no manner er good to tell you, cause, 's I said b'fore, white folks doan bleeve nothin an tain no use to argyfy wid you."

"Go ahead, Cato, if the doctor cured you that's proof enough certainly."

"Well, den, you 'member dat ole cullud woman I hed ter keep house for me last spring? Yes, well wot you spose she wanted ob me? Why, sah, she jess wanted me 'ter marry her—fac, sah"—

"She could have done much worse than try to persuade you to marry her, could she not, Cato?"

"Not much wuss fur me, boss, 'bleeged to you; but you doan s'pose I'd marry sich an ole darkey's she wus?—no, sah, Cato knows bettern'n dat, an I told her so too.

'Well den,' she says 'Cato you'se kin keep house fo' yous'f. I doan keep house fur no 75-yar-old widder like you be,' an' she packs up her duds an lit out 'bout de maddest pussun dat ebber let dis place.

Now, right hyar is whar de trubble all cum in. After she lef I went up stairs an slep on de same bed me and my wife Susan used ter sleep on 'fore Susan died, an dat's de same bed de ole woman slep on fore she lef my house—Well next mawnin I felt curious like—I'se hed misery time'n gin but nothin like dat feelin—De ole woman when she lef she says: 'Cato, yo'll git de misery shore,' and she had 'bout de meanest look ebber seed on a woman's face. Well, I kep on gittin wus an gittin wus and finally I 'cluded ter go'n see dis doctor—I tole him how I lost my wife, Susan, an how I hed a house-keeper 'twanted ter marry me, an' how mad she wus wen I 'fused to marry her an 'bout my sleepin' on de same bed de ole woman slep on, an' now, boss, you jest mind wot he said, he says: 'Cato, you'se had a blight put on you, you'se got a enemy. Hain you ben sleepin on de same bed dat enemy slept on?' I tell you, boss, he jess knowd all bout dis case, fact, I nebber seed a man knowed so much's he knowed.

'Cato you mus put a stop to de wuk of det enemy er youse'l jess foller Susan—shore'—

'But how kin I stop him, doctor,' sez I—'an sez he,

'Did'n I tole you you'se been sleeping on same bed dat enemy slep on? Now you mus bu'n dat bed; take 'er way in de back lot somewhar—anywhar—an bu'n it. Nothin but fiah'll cure you, Cato. Wen you bu'n de bed, youse'll jess bu'n de life out'en dat enemy an de blight'l let go twonct an' mor'n likely dat enemy won't live the yar out.'

Last week I tuk de straw tick an de fedder tick out'en de back side my orchard an bu'nd em both and hyar I am gittin' well ebbry day. Now, boss, wot you tink ob dat? Ain' dat de proof?"

"Didn't he give you any medicine to take, Cato?"

"Yes, he gib me sum bitter medicine out'en er bottle, but tain' dat wot's curin' me; 'tain't dat, its bu'nin de bed wots doin' de work."

"Well, Cato, the doctor has done a good work, he has filled your stomach with quinine and your wooly head with nonzense, and that nonsense has cost you a good bed."

"Dar you is now, boss, wat'd I tole you? Sich unbleevin' wuk'll mak it mighty hard for you ebber to git frue de eye of a needle; maybe some ob dat 'proved 'chinery on your fahm 'l git yo frue, but i'se mighty feared not." Cato's idea of bringing the temporal aid of farm machinery to assist a weak spiritual faith sufficiently to enable me to make a safe passage through the eye of a needle, was unique even if not practical. A. T. T.

Franklin Park, N. J.

MAGAZINE REVIEWS.

ST. NICHOLAS'S list of song and story for the youngsters is so good that it is difficult to select from it, but perhaps the most interesting is the short sketch, with photographic portraits of Yoshi Hito, Haru No Miya, the child of modern Japan, by Eliza R. Scidmore. The present ruler of Japan passed his early life, like his ancestors, in the strict seclusion of the imperial palace, his sacred face unseen by his subjects, and going abroad only in a covered palanquin to some other high-walled palace or temple. But his only son, Haru, who will be 10 years old the last day of next August, and who is about the size of one of our six-year-old boys, is quite emancipated, making laws of conduct for himself in a way quite horrifying to the old nobles. He answers his father back, (though very politely) contradicts, and gives his own opinion as if it were an ordinary father he addressed, instead of the Son of Heaven, the 121st ruler in Japan's unbroken imperial line. The young prince's opinions and ways are said to greatly please the Emperor.

A laughable incident occurred at a school entertainment at Tokio, when he was only seven years old. Noticing a small American boy with his hat on, he ordered his aide to go and tell the boy to take off his hat; but becoming impatient, before the officer could reach the offender, young Japan left his seat, marched down, and himself knocked off the offending hat. "Young America never stopped to see who the aggressor was, but struck back, and in a few minutes the future emperor and one of our future presidents had clinched, and were slapping and pounding each other in the most democratic manner. The horrified nobles and the frightened parents of the American separated them. 'That boy slapped me first, when I wasn't doing anything to him!' persisted the young American. 'I have punished that boy for his impoliteness in wearing his hat in my presence!' said the pompous princeling." Young Haru is a colonel in the Japanese army, and wears the military uniform. One set of gray-headed nobles escort him to school, and carry his books to and fro, while others attend the mite of a prince during his play-hours. He plays foot-ball and other school games as earnestly as he studies, and has decided upon English as the first foreign language to learn.

"Louis the Resolute" is another story from real life. It tells how a lad walked from Chelsea, Mass., to Washington, to secure a naval appointment. After encountering what seemed unconquerable difficulties, which he overcame by his unyielding perseverance and resolution, he finally attained his desire, though a special law had to be passed to get him into the navy. A fac-simile of the autograph note sent by Mr. Lincoln to the Secretary in the lad's behalf, is an interesting feature of the article, which is contributed by Harriet Taylor Upton.

"Grandpapa's Coat," by Alice Maude Ewell, portrays the social and home life of the young people of Revolutionary times very prettily. Grandpapa was a Whig who had sworn to wear the same coat till the war was over. Nancy and Cis, who lived with him, and who were "mightily set up (as was more common with gentlefolks of those days than now), about being Hardwicks of Hardwick's Choice," patched the coat with crooked and puckered patches, and finally with a piece of bright yellow buckram, "so that Grandpapa *can't* wear it to the ball," as Nancy said. The story is illustrated with several taking pictures, including one of the two sisters.

"Among the Florida Keys," by Charles Frederick Holder, is the first of a pleasant series of articles on Natural History, written in an entertaining style, and with plenty of boys in it. There is another installment of "The Bunny Stories." The Bunnies are pictured with rabbits' heads, but the rest of the bodies look strangely like those of boys and girls, and it is not difficult for the least bright of our little ones to apply the Bunnies' good resolutions and imitate their good deeds. "How a Battle is Sketched," "How Mattie Went to Meeting," "How Rockets are Made," and directions for making soap bubbles help make up the prose, and there are half a dozen or more finely illustrated poems, besides an odd picture of "Mermaids and Their Pets," drawn by Mildred Howells, the daughter of the novelist, W. D. Howells.

THE CENTURY for July presents a very timely article by Charles Barnard, entitled "Inland Navigation in the United States." The Americans are great travelers, and one of the pleasantest modes of travel during the summer season is by water. Mr. Barnard pictures the delights of a water voyage on many of our inland water-ways. He states that on June 30, 1886, we had 5,467 steamers in use on our coasts, rivers and lakes. We have over 20,000 miles of navigable waters traversed by regular lines of steamboats. "We have several great routes on which one can travel for a week without changing his state-room." There are hundreds of towns whose only means of communication are by water, and millions of people receive their mail by steamboat. "No man can fairly be said to know this country until he has seen it from the deck of a Sound or coastwise steamer, or from the guards of a Western river boat; until he has looked over the waters of the great Northern lakes, steamed through the Golden Gate, or gazed from his state-room windows upon Alaska glaciers." Descriptions are given of Western river boats, stern-wheel boats, Sound steamers, and many others, ending with a description of the new Sound steamers Puritan, Connecticut and City of Worcester, the Hudson river boat New York, and the screw propelling ferry-boat, Bergen. The Puritan which made its first trip about three weeks ago, is the largest and finest boat of its class ever built. It is 420 feet long over all, has four decks, 91 feet wide at the center, and is 70 feet high. The boat can carry comfortably 3,000 passengers, and has sleeping accommodations for 1,200. It is lighted by electricity, and is propelled by engines of 7,500 horse-power. The article is profusely illustrated. Mr. Kennan's Siberian article is entitled: "The Free Command at the Mines of Kara," and describes a night visit to the political exiles. The Lincoln history deals with the circumstances attending Lincoln's renomination, the Wade-Davis Manifesto, and Horace Greeley's Peace Mission. The artist, Frederic Remington, gives his experiences among the Apache and Comanche Indians, and his article receives added interest through its criticism by Hamilton Wright Mabie under Open Letters. "The Last Trip In," the picture by Mrs. Mary Hallock Foote, is also a Western scene. Bishop Hurst in "The Temperance Question in India," gives the results of his experience and observations during a recent visit to that country. The native appellation for intoxicating liquors is a striking and suggestive one: "Apka Shrab" or "Government Shame Water." Other very interesting articles are "Women in Early Ireland," "Presentiments, Visions and Apparitions," "An Echo of Antietam," etc. A number of poems lend spice to the feast of good things. The Century Co., New York.

SCRIBNER for July opens with an interesting article on the "Telegraph of To-day," by Charles L. Buckingham. A complete history of the evolution of the telegraph from its first invention to the present time is given, together with explanations of the duplex and quadruplex methods, the Wheatstone, chemical-automatic and stock telegraph instruments, deep-sea telegraphy and the methods of finding breaks in cables, communication between ships at sea without a wire, telegraphing from moving trains by induction, etc. The article is profusely illustrated, and while some parts of it ar too scientific to be interesting reading to the average man, there is much valuable information for the general reader. "How the Derby was Won," by Harrison Robertson, will prove attractive reading for the devotees of horse-racing. Another installment of Robert Louis Stevenson's "The Master of Ballantrae" is given. "The Rock of Beranger," by T. R. Sullivan, gives the incidents of a walking tour made by two young men in the mountains of Switzerland. "The Governor," by George A. Hibbard, is a very cleverly written story. The Governor, after acquiring riches and honor, decides to pay a visit to his boyhood's home, which he had left nearly two score years before, because the girl upon whom he had lavished his boyish affection had been won by another. By chance he is taken to the house of his birth, which he finds inhabited by his hated rival, a retired country doctor, and his interesting family, the youngest daughter of which is to be married on the morrow. He stays. The bride confides in him as to "Jack's" position with a firm in the city where they are to live, and his hopes as to a partnership. A telegram goes from the Governor to the city, and during the reception following the wedding, one is received by "Jack," apprising him that arrangements for the partnership can now be consummated. Some half-dozen complete stories, with several poems and a comedietta in one act, complete the number. Charles Scribner's Sons, New York.

MANLY PURITY AND BEAUTY

CUTICURA REMEDIES CURE SKIN AND BLOOD DISEASES FROM PIMPLES TO SCROFULA.

NO PEN CAN DO JUSTICE TO THE ESTEEM IN which the CUTICURA REMEDIES are held by the thousands upon thousands whose lives have been made happy by the cure of agonizing, humiliating, itching, scaly and pimply diseases of the skin, scalp and blood, with loss of hair.

CUTICURA, the great Skin Cure, and CUTICURA SOAP, an exquisite Skin Beautifier, prepared from it, externally, and CUTICURA RESOLVENT, the new Blood Purifier, internally, are a positive cure for every form of skin and blood disease, from pimples to scrofula.

Sold everywhere. Price, CUTICURA, 50c.; SOAP, 25c. RESOLVENT, $1. Prepared by the POTTER DRUG AND CHEMICAL CO., Boston, Mass.

Send for "How to Cure Skin Diseases."

Pimples, blackheads, chapped and oily skin prevented by CUTICURA SOAP.

Rheumatism, Kidney Pains and Weakness speedily cured by CUTICURA ANTI-PAIN PLASTER, the only pain-killing plaster.

CATALOGUES, ETC., RECEIVED.

MUNSTER AGRICULTURAL AND DAIRY SCHOOL.—This school is located at Cork, Ireland. It is maintained by the Irish Commissioners of National Education. It is a school for young women, though a few young men are admitted at times. These young women are taught the principles of good dairying from the feeding of cows to the marketing of butter and cheese. There are also facilities provided for the study of plain cookery, cookery for the sick, the proper use of kitchen utensils, etc., etc. In 1888, 75 young women attended the school. There has been a gradual falling off in attendance for several years. Various reasons are assigned for this, the most probable being the introduction of the factory system in the south of Ireland. This system lessens the number of farmers who make their own butter. The graduates of the school seem to be doing very well. Many of them are enterprising enough to manage dairies or even butter factories.

Particular pains have been taken to build up a herd of superior butter cows at this school. Unfortunately we are not told what breed has been selected.

In 1886 the herd averaged 251 pounds of butter per cow; in 1887 245 pounds and in 1888 247 pounds. Great attention is given to the feeding of milch cows. Mr. R. H. Beamish occupies more than half the report in an essay on what he calls an improved method of feeding. We must confess to an inability to make out what the author of this essay is driving at, beyond the following statements. 1. A good cow pays a better profit than a poor cow. 2. When the dairyman discovers the food best suited to his purpose he should stick to that and avoid all violent changes of food. 3. Cows should be fed on the same principles whether milk and butter are low or high in price. It is no economy to cut down the food when dairy products fall off in price.

HOUSEHOLD PESTS.—This subject was selected by Prof. C. H. Fernald for Bulletin No. 5 of the Hatch Experiment Station at Amherst, Mass.—(We wish somebody would explain why there should be *two* experiment stations at this place.) The Buffalo carpet beetle, the pitchy carpet beetle, the bacon beetle, clothes moths and ants are the insects selected as most needing a bulletin. The R. N.-Y. cannot see that Prof. Fernald has given us much information as to methods of killing these hated pests. The habits of the insects are well described and there are numerous suggestions.

MARYLAND EXPERIMENT STATION.—The First Annual Report of this institution is at hand. It occurs to the R. N.-Y. that this station devotes a good deal of space to giving its own history and telling what it proposes to do. This station claims to be the first one to be established in America. February 1856 is the date given. Mr. Bishop, the Horticulturist, discusses some potato experiments. He says that many experimenters have concluded that "the larger the quantity of seed planted, the greater the corresponding crop." Mr. Hayward has cultivated the Soja bean and feels like recommending it for Southern farmers. An interesting fencing experiment has been started. Posts have been set in 10 different ways to see which will stand longest.

ROAD LEGISLATION FOR THE AMERICAN STATE.—No. 3, Volume 4, of the publication of the American Economic Association. By Jeremiah W. Jenks. It is hardly possible to think of a question of economic science that is of more lasting importance to the American farmer than that of the wise regulation and maintenance of country highways. Prof. Jenks has prepared a very valuable essay full of apt illustrations, pointed suggestions and logical reasoning. The R. N.-Y. is glad to give a synopsis of his views, because road legislation is a matter that appeals strongly to the good sense of the American farmer. American country roads are, as a rule, greatly inferior to roads of a similar class in England, Germany or France. Even the German laborers who come to this country are quick to recognize this. Do we realize that our inferior roads may be caused by an inferior system of working them? The astonishing growth of our railway systems, and the hardly less wonderful development of water navigation, have gone far toward taking public attention away from common roads. Few of the present generation of Americans realize that before the perfection of railroads, the construction and maintenance of common highways was a question of national importance, more of an element in political contests than any of the railroad questions of the present day.

Madison, Monroe and Jackson felt called upon by their interpretation of the Constitution to veto bills appropriating money for the construction of roads, yet they had to acknowledge the wisdom of such appropriations. Since 1830 when railroads began to take the place of the larger wagon roads, the question has been dropped from national politics. It might be profitable for the country if to-day, it could be substituted for some of the present party differences. When we talk about the wonderful convenience of our railroads, we are apt to forget one very important point, viz:—every pound of freight and every passenger must pass over our common roads before reaching the railroads. Think of it. The iron roads of which we are so proud, are absolutely dependent upon our common roads for their freight. We have tables of statistics giving the cost of transportation of various articles over the railroads, but who estimates the cost of transportation by wagons and horses? The Agricultural Department estimates that the average cost of hauling 100 bushels of wheat one mile is 60 cents. That is, it costs the average farmer more to carry each bushel of wheat one mile than it does the average railroad to carry one ton the same distance. Have you ever thought of this before? When you do think of it, just remember that the difference in force required to haul a ton over the best possible stone track and the common dirt road is as 12½ to 200; that is, the force required on the dirt road is 16 times that required on the other. This will give you an idea of the importance of this road question.

The system of road legislation now employed in many parts of our country comes from a form introduced from England by the earliest settlers. The elective township or district road officers and the labor tax are the main features of this system. In former times when population was sparse and traffic almost wholly local, such a system was well enough. To-day the circumstances attending road traffic are so different that one would naturally suppose that an entirely different system of road legislation would be practiced. It is not so. People have clung to old traditions and customs, oftentimes to their own disadvantage. Prof. Jenks discusses the history of road legislation and then gives his ideas as to the system that would most benefit Americans. He goes to the countries possessing the best roads and undertakes to show why these foreign roads are superior to ours. He infers that there are just as good road-making materials in America as there are in France, Germany or England, and that our climate is no more trying on roads. These things being true, our disadvantage must be in the system of supervision and construction.

The most important point about German and French roads is that they are divided into different grades or classes. The State or national roads, those running between the larger towns and cities, are built and supported by the government and managed by government officials. These are military roads and are kept in perfect repair, funds for maintaining them being raised by taxation just as funds for any other public service would be raised. Then come the provincial roads. These connect the military roads and are supported mainly by the province through which they pass. Connecting these provincial roads are local roads which are supported by the village or country district and placed under local authority though the State sees that they are kept in good repair. In France the roads are under the management of State engineers whose chief is the Minister of Public Works. One hundred years ago many of the country roads of England were in a terrible condition, Arthur Young described a ride over one of them as "18 miles of execrable memory." To relieve the country, turnpikes were established—built and managed by the Turnpike Trusts, which collected tolls and thus paid themselves. These trusts failed though they helped the roads greatly. There are still many toll roads in England, though Ireland and Scotland are freed from them. The English are now working towards a system that will give the government a general superintendence of road affairs, the details to be worked out by county and local authorities.

After reviewing foreign road legislation, Prof. Jenks proceeds to suggest plans for American legislation. He would abolish all toll roads as soon as a due regard for the rights of the corporations permits. Roads should be classified with reference to their relative importance. In most States three classes will answer. These classes are:—

(*a.*) Roads of the first class, main roads connecting large towns in the same or adjoining counties or those much used for long-distance traffic, should be controlled solely by the county authorities and supported by county funds. So far as such a road served in part of its length as a local road the town benefited thus might contribute to its support.

(*b.*) Roads of the second class, those connecting roads of the first class or serving as principal feeders to them, also those serving as connecting roads for two or more townships, should be supported mostly by the towns in proportion to the benefits received, aid being given by the county in case of special expense, such as the building of a costly bridge, or in case of real inability to pay on the part of the town. The management of these roads, details of working, etc., should be in the hands of the county authority.

(*c.*) The roads of the third class, merely local roads, should be supported by the town and managed by town officials.

The classification is to be made by the county supervisors or other county authorities. They are also to hire on a salary a civil engineer, who is to be responsible for roads of the first and second class. He could also act as county surveyor. The county is to be divided into suitable districts large enough to keep two men busy whenever the weather is such that road work can be done. These men are to look out for all minor repairs, etc. Highway labor is to be abolished unless it be in the case of a certain rate above the ordinary limit. Provision should be made for borrowing money, under strict conditions, to make permanent roads. A State engineer, or a State board of engineers should be appointed with general supervisory powers.

The main points urged by Prof. Jenks are a proper classification of roads, the employment of skilled engineers and the doing away with highway labor.

ORITUARY.

Isabella Smith.

"QUICK death is easy—he who dies slowly dies a thousand times;" and so passed from earth away mild-mannered, pure-minded, industrious "Bella" Smith, an aforetime compositor in this office. The grim messenger came suddenly to this young girl and at a time when in the exercise of an apparently intensified cheerfulness, summoned to her aid in order to enliven the somewhat dampened spirits of a much-loved younger sister, who was about to be deprived by time and distance of the society and companionship of one to whom she was bound by the most tender ties. Alas! how utterly weak and powerless are words to afford consolation and comfort to those who are comfortless!

"Sister, thou wert mild and lovely,
Gentle as the summer breeze,
Pleasant as the air of evening
When it floats among the trees.

* * * * * * *

Yet again we hope to meet thee,
When the day of life has fled;
Then, in Heaven, with joy to greet thee,
Where no farewell tear is shed."

On Tuesday last, in the beautiful cemetery of the Evergreens, all that was mortal of this gentle girl was reverently laid to rest.

THE POST-OFFICE CLUB.

IT has been noticed that our parrot has been remarkably quiet of late. I should have explained before this why he has not been heard from. It is quite a sad affair all around. About 10 weeks ago the parrot thought he had a chance to clinch his monotonous argument. A Western man visited our place. He came to the store one night and proceeded to give us a dismal prophecy as to the future of Jersey farming. Western men are usually great talkers and they seem to know so much more than we poor Jerseymen, that they have a monopoly of the conversation. This man made us feel very tired. He said that within 50 years the West would reduce agriculture to such a science that it would raise all the food needed in the country. Railroad transportation, he said, would be so developed that we would have absolutely no show at all. All we could do, he said, would be to leave our poor lands and move out West where a man could farm all day without ever leaving his comfortable seat. He did talk it off in great style—there is no doubt about it—and it made many of our young men feel pretty blue. We older men know there is a great deal of nonsense about such talk. There is just as good a chance in one corner of this country as there is in another, and so it goes. Sound sense and energy can make farming prosperous anywhere. But I tell you this Western talk was just nuts for our parrot. How he did enjoy it! He fairly danced on one foot at the dismal picture our Western friend drew.

"*Farmin' don't pay! Farmin' don't pay,*" he croaked as the Western man knocked the cover off the sugar barrel in one of his violent gestures.

Now the store-keeper has a fine large cat that is a great favorite with all the club members. He has reason to think farming a very good business, for he is presented with a variety of farm products that go to keep him fat and sleek. Consequently he has reason to hate the parrot. When he saw the bird dancing in glee therefore he gave a sudden spring and caught our great agricultural critic by the neck. Before we could drag the cat off he had shaken the parrot well. Perhaps we didn't jump as fast as we might have done. The fact is the potato beetles have been so numerous this spring, and we have worked so hard trying to fight them, that we feel hurt whenever the parrot croaks.

The cat had given the parrot's neck a good twist. I think he must have thrown the vocal chords all out of shape. For a long time the poor bird had nothing to say. He stood in the corner with his head under his wing. At last a tired farmer painted a very dismal picture of agriculture, and the parrot held up his head, opened his mouth, and croaked: "Farmin' —— pay! Farmin' —— pay!"

It appears that the cat so hurt his throat that he can't say "don't;" therefore he gives the lie to his own thoughts every time he speaks. This hurts his feelings so that he sulks and says nothing. A very sad case, we think.

Oh, swaying nest, by summer winds
Like rustic censer lightly swung,
How slight the tie that lightly binds
Thy weight the swinging boughs among;
A tiny home, soft sheltered 'neath the eaves,
The emerald cornices of fluttering leaves.
I bend above with loving eyes
To peep into the downy home,
And with a cry of real surprise
Set off across the fields to roam.
Whoo—whoop! There are as near as can be guessed
Four hundred thousand hornets in that nest.
—*Burdette, in Farm Journal.*

AN UNPARDONABLE SIN.—Editor's wife: "I wonder what can be the matter with Mrs. Smith; she hasn't returned my visit yet." Editor (absent-mindedly): "Perhaps you neglected to inclose a stamp."—*Harper's Bazar.*

"MINNIE has been to see me to-day," said a little five-year-old; "and she behaved like a lady." "And I hope you did, too;" said her mother. "Yes, indeed I did; I turned somersets for her on the bed."—*Old Colony Memorial.*

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII. NO. 2060. NEW YORK, JULY 20, 1889. PRICE FIVE CENTS, $2.00 PER YEAR.

[Entered according to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

Horticultural.

Notes from the Rural Grounds.

THE PARKER EARLE STRAWBERRY.

TWELVE or 15 years ago, there was some fun in looking out for all the new kinds of strawberries as they were announced, procuring a few plants, setting them out, each kind with a label bearing the date, etc., entering them in the RURAL book of reference, watching their growth and fruitage, and, later, eating the berries and deciding upon their merits or demerits, and at length giving our readers the results. As many as 150 different varieties have thus been studied during a single season—never less than 75. When we tell our readers that scarcely more than a dozen of this great number of carefully-tested varieties are notably superior to the kinds which were favorites when we commenced this work, they will hardly be surprised that we find ourselves growing tired of the work. Still the work, during the past season, has been carried on with unabated diligence if with somewhat less fun, and it is with a sense of real pleasure that we have to announce that one of the varieties under trial bids fair to fill a previously unoccupied place. It is the Parker Earle, shown at Figs. 179 and 181. True, we have tried it but for a single season. True, the season has been one of unusual rainfall, giving in great abundance the "more water" and "still more water," which many suppose the strawberry plant must have to do its best. We have merely to inform our readers just how this new-comer has behaved itself during this first year of trial, and then leave them to judge whether it may be deemed worthy of trial in their own gardens.

FROM THE R. N.-Y. RECORD.

"JUNE 1, 1889.—Plants received in June of last year. The largest and strongest vines ever raised here the first year from summer-set plants. A foot high. Peduncles strong and upright, as many as 12 to a plant, each carrying from 20 to 30 berries. Its magnificent foliage may enable it to ripen all these. Suckers freely. None ripe. . . . June 5: Medium to late in season of ripening. A few ripening now. The berries usually turn to an ivory-white before coloring, as if they were white berries. . . June 8: Berries medium to large, very often crinkled. Shape ovate, very often largest in the middle, tapering to both apex and stem. Neck prominent. Mild in quality; that is, neither acid nor as pronounced in the strawberry flavor as the Charles Downing, Henderson or Prince. . . . June 16: We have picked more berries from the 24 plants of this variety than from any other 24 plants ever raised here. The quantity of berries in various stages of maturity is something surprising. Many are rotting from excessive rains. Rather soft at this time as are all other kinds. In the earlier part of the season the berries seemed firm enough for shipment. Color rather light red. Foliage continues perfectly healthy. . . . June 28: We are still picking a few from the Parker Earle. It holds out with the latest. Berries are now fairly firm and of medium size and good quality. It is a most promising variety."

Our engravings are the direct reproductions from photographs, the one showing the productiveness of an average plant; the other the *average* size of the berry. There is little need of exaggerating the good points of this berry in any way.

THE ORIGINATOR OF THE PARKER EARLE.

JAMES NIMON, whose photo-engraving is herewith presented at Fig, 180, is of Scotch-Irish parentage and was born January 2, 1849. He spent his boyhood days from the age of 10 until he was 21 years old, among the peach orchards, and nurseries near Middletown, New Castle county, Delaware. In April 1872 he concluded to take Horace Greeley's advice: "Go West, young man, go West and grow up with the country." He spent two years in Carroll county, Illinois, where he made the acquaintance of Miss Nellie E. Rood, whom he married in October, 1873, and immediately moved to Leavenworth, Kansas. Here he engaged in the nursery and greenhouse business until December, 1879, when through the influence of friends and a desire to again engage in the peach business, he moved to his present home, Denison, Texas, where he is known among his horticultural friends as the "Silent Worker," having taken an active part in the development of the horticultural interests of this section. He is well known among Texas agriculturists for the system in his work in horticultural exhibitions, and among fruit dealers for the excellence of his products and the perfection of handling and packing of the same. The production of the Parker Earle strawberry so stimulated him as an originator that in 1888 he grew many other seedling strawberries, which fruited for the first time in 1889. Many of these are fine. One especially produced a very fine crop of beautiful berries which ripened exceedingly early. This promises to make a splendid companion for the Parker Earle. This season it was ripe and gone when the Parker Earle and Crescent began ripening.

HISTORY OF THE PARKER EARLE.

DENISON, Texas, June 8, 1889.

Ed. R. N.-Y.: In response to the RURAL'S

RESIDENCE OF JAMES NIMON, DENISON, TEXAS. From Nature. Fig. 178.

request, I give the following history and data concerning the Parker Earle strawberry.

In May, 1886, while one day visiting Prof. T. V. Munson, of this place, we were viewing his strawberry plantations, and discussing the subject then much written up in the papers—the influence of pollenization, and its effects upon the characteristics of the fruit pollenated. Before us were Crescents growing alongside of Mr. Munson's very characteristic seedling No. 3, which has a perfect flower, and we concluded that if the theory be correct—that the strawberry fruit would show the markings of the variety that pollenated it—the Crescents in this case would certainly do so. Failing to find any proof of the truth of the theory in the fruit examined, I suggested that I would plant the seed from a number of the berries under examination, which were typical Crescents, and taken from plants well exposed to the No. 3 referred to, so that we might determine from the offspring whether or not cross-fertilization had really taken place. A considerable number of plants were obtained, most of which showed the unmistakable characteristics of the No. 3 more than of the mother Crescent, proving beyond question that cross-fertilization had taken place.

Among the seedlings were several fine varieties, one a large, dark crimson, known as No. 2, very early, much inclined to overbearing, and of so much promise that I am still holding it on probation, but the one that eclipsed all the others, and which promises to eclipse all others is now known as Parker Earle. It produced its first fruit in 1887, and again the original plant, with its sets in a short matted row, bore a crop that astonished every one who saw it for the beauty and quality of the fruit produced, the yield being at the rate of 15,000 quarts to the acre. The original plant was allowed to remain in the same place but was much neglected, and this season it had formed a matted row three feet long and about one foot wide, which yielded one full quart at each of three pickings, and I am satisfied that at least half that quantity was wasted by neglect and the depredations of birds.

The following record was kept of a plot of 25 rows, four of which were Parker Earle, set nine months ago; five rows Captain Jack, two rows Cumberland Triumph, and 14 rows Crescent. All were treated as nearly alike as possible, except that the Parker Earles were not planted until the latter part of June, while the others were planted in March, '88, and all the runners of the Parker Earle were removed to another plot for the purpose of increasing the stock, thus leaving only the 229 old plants in four rows about three feet apart, the rows being 3½ feet apart.

The other varieties named were left in regular matted rows, that would average one foot wide, without a break, and 3½ feet apart. The Parker Earle—229 plants—produced 251 quarts picked, or 62¾ quarts to the row. The other 21 rows produced 1,150 quarts or 54 16-21 quarts to the row. The fruit of the Parker Earle sold the season through in our market at nearly one-third more per quart than that of the other varieties, except the Cumberland Triumph which brought the same price, but gave the smallest yield of all. In a neighboring plantation were Jessie, Bubach, Cloud, May King, Warfield No. 2, etc., etc., but the verdict of all was that the Parker Earle was much superior to any of them.

So it seems that in solving a problem in horticulture, we also gave birth to a noble variety of this most cherished of fruit. And I trust it will be an enduring monument to him whose honored name it bears.

JAMES NIMON.

OVERBEARING BLACKBERRIES.—I noticed in the RURAL the report of the enormous crop of Taylor's Prolific blackberries. Last year we had a great crop of the same. We picked once or twice and the rest all fell off, leaving the hull. This year they seem still more prolific. Thinking there was a deficiency of leaves on the stalk to support the fruit, I have cut off half of the fruit stalks, and some more than half, and I would recommend the RURAL NEW-YORKER to try to save them in the same way. The Agawam is not as full and the Erie I think is about the right proportion. Try part, at least. ISAAC HICKS.

Westbury, L. I.

I HAVE 12 vines from the Niagara grape seeds the RURAL sent me. Six of them bore grapes last year and they were very nice—not large but medium in size and nearly all round. One is oblong, but all are of a light green color when ripe and are fine-flavored. I lay all my grapes on the ground and throw some sticks or vines on them. I can't tell whether these will winter without this precaution, but I think they are excellent. S. C. R.

Miscellaneous.

"A TARIFF ON BANANAS."

WOULD IT HELP FRUIT-GROWERS?

GENERALLY AGAINST IT.

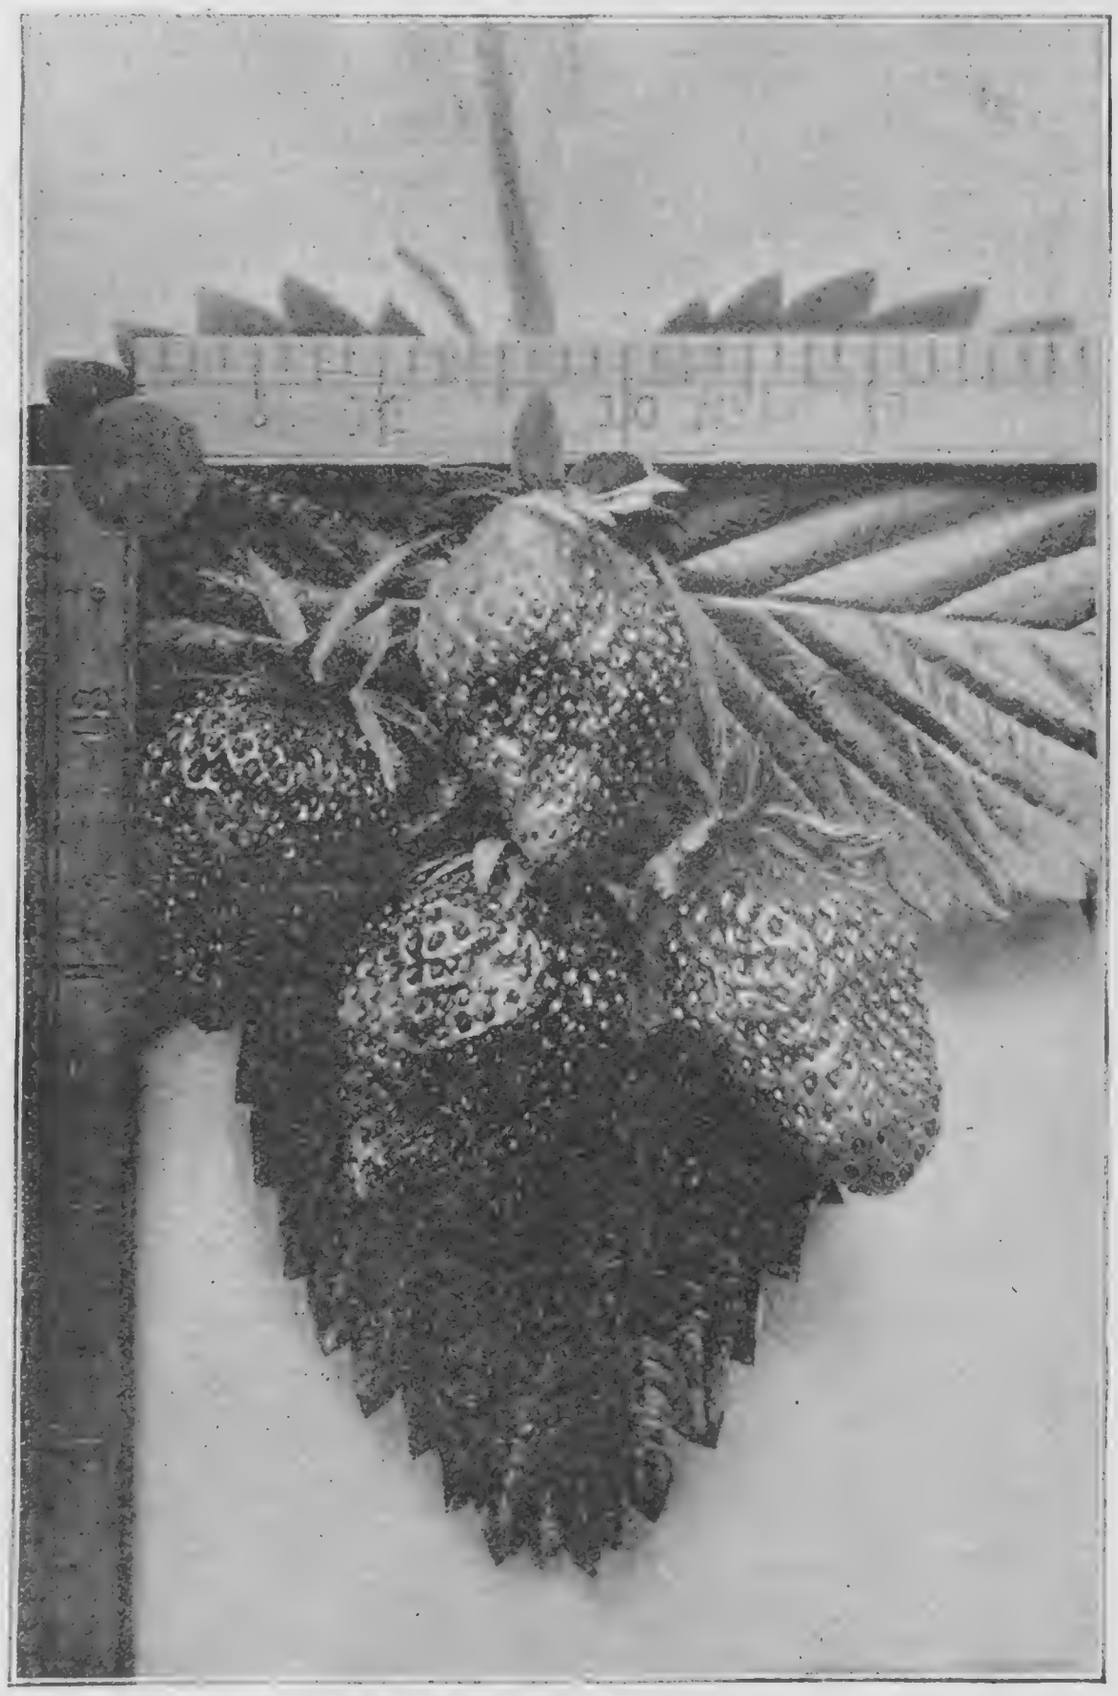
AN INTERESTING DISCUSSION

Two weeks ago, the R. N.-Y., under the above caption, spoke of the fact that some strawberry growers attribute the low prices of this season to the presence in the market of vast quantities of bananas and pine-apples which were sold at surprisingly low prices. Such growers claim that the price of strawberries was regulated by the price of the bananas, the public demanding a certain quantity of fruit for a certain amount of money, this amount being regulated by the price of the cheapest fruit.

An examination of tariff legislation for the past 50 years shows that no less than a dozen changes have been made in the tariff on bananas and pine-apples, these two fruits being considered most harmful to the business of strawberry growers. Under the tariff of 1846 bananas and pine-apples were taxed 20 per cent. *ad valorem*. In 1857 this was reduced to 15 per cent. and in 1861 the fruits were made free. In 1864 a duty of 25 per cent. was levied and in 1868 this was reduced to 20 per cent. Thus far the two fruits had been put in the same class but after 1868 they were separated. In 1871 the duty on bananas was reduced to 10 per cent. while that on pine-apples was kept at 20 per cent. In 1874 both fruits were made free. In 1875 bananas were taxed 10 per cent. and pine-apples 20 per cent. This continued until 1883 when both were made free again. They have been admitted free ever since to this date. The fruits were put on the free list mainly through the efforts of the large importers in this city. The removal of the tariff has been very profitable to them. One importer told a R. N.-Y. representative last week that his companions in the business could well afford to pay $50,000 to prevent a renewal of the tariff. As to the extent of the business, here is a statement showing the values of banana importations for the past five years:

1884	$1,878,279
1885	2,156,873
1886	2,356,843
1887	2,682,143
1888	3,153,645

In 1887 $437,009.41 worth of pine-apples were imported, and in 1888, $537,198.35 worth. Thus we see that in 1888, $3,690,843 worth of the two fruits were brought here free of duty. The importations for 1889 are, thus far, largely in excess of those for a corresponding period of 1888. It must be remembered that besides the quantities of these two fruits, there were also imported, in 1888, $2,084,004 worth of olives, tamarinds, plantains, cocoanuts and other nuts and fruits free of duty. And besides this, during the same year there were imported other fruits and nuts, including oranges, lemons, raisins, peanuts, limes, dates, figs, grapes, prunes, etc., to the value of $15,106,551 on which duties were paid averaging 29.64 per cent. *ad valorem*. It is also well to remember, in this connection, that the total value of all orchard products sold or consumed in the United States for 1880 was $50,876,154. It is impossible to give any reliable statistics as to the value of the annual product of strawberries.



PARKER EARLE STRAWBERRIES From Nature. Fig 179.

The following opinions are interesting:

FROM FRED GRUNDY.

There are banana cranks in every town and village, who would have bananas if they cost 10 cents apiece, and if the market at the same time were flooded with strawberries and all other kinds of berries at five cents a peck. The person who wants a banana or an orange generally wants that particular article, and nothing else will satisfy him. More bananas have been sold in this town this year than in any five previous years. They sold simply because they were cheap—two for five cents. I do not think, however, that their sale checked that of berries to any appreciable extent. The demand seems to be about as brisk as usual. If bananas were dearer—say ten cents apiece—I am satisfied that but very few would be sold here. Of course, a high tariff would increase the price of such fruits and naturally check importations, but whether that would help berry-growers is a question. If berry-growers will glut the market they must take the consequences. If people were determined to have a certain quantity of fruit, irrespective of kind, they would buy that which was cheapest; but I observe that when all fruits are dear many go without and turn to their flesh-pots and cabbage, while those who can afford it buy the fruit which best tickles their palates, be it pine-apples or strawberries. A tariff is all right when levied on such articles as can be plentifully produced under our own flag, but keep it off all good fruits that we cannot grow. Last year I was cloyed on raspberries, and this year I am selling them and buying bananas, prunes and oranges.

Christian County, Ill.

FROM SECRETARY E. WILLIAMS.

I am not one of those who believe a high or even prohibitive tariff on bananas would be of the least benefit to the strawberry growers. As the RURAL remarks, "a strawberry never will take the place of a banana to the person who wants a banana." This can be reversed with equal truth—a banana never will take the place of the strawberry to the person who wants a strawberry. The two fruits are too entirely dissimilar in character and uses. A very high tariff on bananas might stimulate the culture and slightly enhance the price of Florida-grown bananas, but the area in this country suited to this fruit is too limited for the product to make much impression on the demand, and transportation to our northern markets would increase the cost so as to place them beyond the reach of the masses. To enable Florida banana-growing to yield much profit in this market the prices would have to be materially advanced, and bananas are now often more of an expensive luxury than the masses feel justified in indulging in. With pine-apples the case is different. The area in Florida suitable to this fruit is much larger, very much larger than that fit for banana growing, and the imported pines come in direct competition with the domestic product, and of necessity the price of the foreign article governs and regulates that of the home-grown fruit. I look upon bananas and pine-apples as more of a dainty luxury than strawberries. Berries of all kinds I regard as among the essentials. They may be styled the essential luxuries of our table, and I doubt very much whether, if our markets were bare of foreign fruits during the strawberry season, it would materially affect the prices of berries. It would probably increase the sales, as merchants and dealers would be inclined to buy and sell more of them. I know it is very easy to attribute the low prices of strawberries to the abundant supply of foreign fruits, but the over-supply and inferior quality of the berries have much more to do with the price than anything else.

Our Southern friends take the cream of the prices with their berries and vegetables, and the keen edge of our Northern appetite is cloyed by the time our home products are placed before the public. The prices as well as the quality of the Southern supply have reached a low stage to which our hot weather contributes, and purchasers have become so used to low prices by the time our strawberries are offered that they hesitate to invest heavily and curtail the amount of their purchases at an advanced price. It is very easy for prices to tumble, but much harder to rise. If our dissatisfied growers would follow their consignments to market and see the quantity, condition and quality of the competing articles, they might perhaps get an idea regarding over-supply, improper distribution, or even utter worthlessness of the fruit offered, that would throw a ray of light on the cause of low prices which would locate it nearer home. The scarcity of an article always tends to elevate the price if there is a demand for it, while a superabundance or over-supply has the opposite effect. The principal domestic fruits that I consider materially affected in prices by the imported articles are oranges, lemons, pine-apples and grapes, and that these feel the depressing effects of importations I think no one will deny; but I cannot see that a high tariff on bananas would visibly affect the price of strawberries. Others may honestly think differently, and nothing short of a trial would prove which was right.

Essex County, N. J.

FROM M. CRAWFORD.

It must be regarded as a hopeful sign that

strawberry growers are commencing to clamor for protection—not to enable them to pay better wages, or to develop the resources of the country, or because theirs is an infant industry and needs fostering. If they were more cunning and less honest, they would give some plausible excuse, as all others have done. They ask protection on its own merits so that their profits may be increased. The time has come when in many localities the market is over-supplied, and growers are at their wits' ends to find purchasers. In looking for some way out of the difficulty they have tried the plan of growing better berries and have sent them to market in a more attractive condition, but even this inducement to purchasers is inadequate. The sugar that sweetens berries is made dear and hard to get by protection, and by a trust that could not long exist without protection; the cans in which the surplus may be put up are raised in price by the same means; and why not protect the growing of the berries that flavor the sugar and fill the cans? It is now proposed to have the government interfere and raise the price of bananas and pine-apples with the expectation that fewer will be consumed, and so the demand for home-grown fruits will be increased. Of course, there is no justice in such legislation, but as nearly all other classes are protected, by all means let strawberry growers have their share in the prosperity that comes from the protective system.

Summit County, Ohio.

FROM H. M. ENGLE.

There is no occasion to rush for a tariff on bananas, since they cannot take the place of berries. There have been seasons heretofore when markets were glutted with fruits. Another season may bring about changed conditions. There is a tendency among the people to consume more fruits and less animal food, especially during the warm season, and if this increases it will add largely to their health and happiness. Let us encourage the use of more fruits and of less flesh, especially of such as is of questionable soundness.

Lancaster County, Pa.

FROM WARD D. GUNN.

Yes, a tariff on bananas. I see no good reason why a foreign tropical fruit like the banana, coming in direct competition with the products of our own soil and labor, should be exempt from duty. If the American protective system furnishes tempting markets to foreign producers, why should they not pay for it?

Ulster County, N. Y.

FROM PRESIDENT T. T. LYON.

I believe it to be sound policy on the part of our government to encourage the home production of everything susceptible of being economically produced in our climate. If, therefore, the growing of bananas is one of these practicable interests, it should be encouraged. And if, owing to the cheapness of the labor employed abroad, or other cause, the home grower is unable, for the time, to profitably produce bananas, in competition with free importations, the protection of a tariff on importations is doubtless as proper here as in the case of any other imported article. Excepting only for the need of revenue to the government, I deem it impolitic to impose a tariff save upon the principle already stated. It would seem that all the various and occasionally conflicting interests of our soil should receive, as nearly as practicable, equal favor from the government, aside from that already specified. A paternal government, such as ours, cannot reasonably be expected to extend a helping hand to any one of its numerous interests at the expense of another, and for that reason, if for no other, a tariff upon sub-tropical and tropical fruits should be confined within the limits required to develop the growth of these upon our own soil, leaving Northern and Southern products to compete freely with each other in our home markets. If the Northern fruit-grower will eschew the miserable, though showy trash with which the markets are so largely burdened, and give reasonable attention to the quality of his products, he will have little occasion to dread the competition of the banana or even of the pine-apple in his local markets.

Van Buren County, Michigan.

FROM DR. T. H. HOSKINS.

I am glad, even in so limited a way, to see the RURAL desirous to discuss the most important economic question of the day. It is a shame that political intolerance amongst a people claiming to be the freest and most enlightened on earth, should compel the closure of all but party papers to such subjects. The party papers never discuss any public questions fairly. Fairness is not their object. *That* is party success through popular passions and prejudices, and these are stimulated and pandered to by political editors in a way which shows a most cynical estimate of the intelligence of their readers.

As to a duty on foreign fruits, in behalf of the domestic production, if our national policy is to be protective one, I think, as a fruit-grower, that we ought to have as high a tariff tax on all foreign fruits as we can drive our Representatives and Senators in Congress to enact. We have a great country, extending widely in latitude and longitude, and we only need one large West Indian island, say Cuba, to make us a world by ourselves, with perfect free trade! But, then, would not our own Cuban bananas hurt us just as much as the foreign ones do now? Here we, in Vermont, think nothing of that free trade which makes us victims of Western competition; but we are ready to fight to "protect" ourselves against the poor and pitiful competition of the ice-bound province of Quebec. Yet we should probably make little opposition to the annexation of Quebec or of all Canada! The wisdom of our attitude in this matter is hard to see. We cry out for "protection;" every industry insists upon it. But when all are protected alike, we shall discover that protection is no better than free trade. So far, we have not all been protected alike; and farmers practically get little or no protection. In the very nature of things they cannot, because in most of our products home competition brings prices down to rock bottom, lower than anywhere else. Manufacturers and trade have been going the same way; but Rockafeller's great invention of "THE TRUST" is supposed to be a cure for that. Can we unite the different branches of agriculture and horticulture into trusts? If we cannot, (and that seems self-evident,) what *can* we do to defend ourselves? Will a heavy duty upon bananas solve this question? Let us try it, by all means. A good many minds are iron-clad against all forms of demonstrative reasonings, short of the "*reductio ad absurdum.*" Let bananas be taxed. Lots of them are sold in our streets, within half a mile of my orchard. Why have I been so blind that I did not see that they were ruining my business? And I, like a fool, have been buying and eating them!

Orleans County, Vt.

FROM P. M. AUGUR.

With regard to taxing imports of bananas, all I have to say is that, on general principles, I believe in "the greatest good to the greatest number." That American fruits suffer from the great influx of bananas is undoubtedly true, and fruit-growers have as good reason for protection as any other; yet I have no desire to act selfishly in the matter, and I am glad that the common people may partake freely of this tropical fruit. Banish the saloon, and the $900,000,000 now wasted thereby will build up every industry, and domestic and foreign fruit will both alike find a quick demand.

Middlesex County, Conn,

CORRESPONDENTS' VIEWS.

CHOICE APPLES.—The Westfield Seek-no-Further, in the vicinity of Chautauqua lake, is universally subject to cracking, sometimes so badly as to render it unfit for market. In flavor it is *par excellence* a dessert apple. For a cooking apple I prefer one more tart. There are few that excel the R. I. Greening, the Esopus Spitzenberg, Northern Spy, or one more mild, the Baldwin. The latter ranks among the first in this county.

Chautauqua County, N. Y. H. A. W.

I HAVE been testing a few valuable potatoes according to the trench system; but owing to heavy rains they have all decayed, while potatoes planted in accordance with the old way—in hills—are up one foot high and are looking fine; there is not a missing hill. The trench system will do for sandy loam. The Rural No. 2. are up and doing nicely.

Charlotte, Vt. O. H. A.

REPORT ON A CONTEST PLOT.—My contest potatoes were planted according to the R. N.-Y. method, about the middle of April, on moderately rich, sandy soil very easy to work, but weedy. The trenches were plowed out six inches deep, five bushels of ashes were scattered in them, and the potatoes, cut two eyes in a piece, were planted in the bottom, cut side down, no manure but the ashes being used in the trenches at planting time.

The vines were a long time coming up, and grew very slowly afterward on account of the protracted, severe drought, which was never broken with rain enough to wet the ground from April 11 till May 27. On May 21 the weather turned very cold, with heavy frosts on the 23d, 25th, 26th, 28th and 29th, and on the latter date the worst snow storm ever known so late in the spring. Unprotected potatoes were killed by the frosts. I partly saved mine by drawing the earth down on them. They were a good deal hurt for all that, and when uncovered they were pallid, ragged-looking objects. On account of the damage from drought, frost and cold weather, my hopes of making much of a figure in the contest have grown very faint, but I mean to continue taking good care of my plot to see what it will do. I have had it dressed to-day with water from the barn-yard (about 30 pailfuls) for the nitrogen supply, relying on the ashes for potash. In about a week the plot shall have another such dressing.

Did I use too much seed? It took a peck of R. N.-Y. No. 2 and half a bushel of Burpee's Empire State to plant the plot, which is at the rate of 30 bushels to the acre. The R. N.-Y. No. 2 came up first and are now much thriftier, larger and greener than the Empire State. They were bought of Thorburn. They are budded quite full, and if we can get a little warm weather the blossoms will soon be out.

June, so far, has been very cold. Nothing grows but wheat and peas. Corn that was planted three weeks ago is just peeping through the ground and looks as if it were made of white paper. Apples and cherries are not hurt by the frosts. Peaches are a complete failure and strawberries are not much better. MRS. E. D. C.

Farm Topics.

AGRICULTURE; AN ART, A BUSINESS A SCIENCE,

T. H. HOSKINS, M. D.

I.

AS AN ART.

FARMING, as an art, is as old as civilization—when, after recognizing the food value of a single plant, a man first tried to promote its growth and increase, he found the task attended with difficulties; and in surmounting those difficulties he acquired some of the elements of the art of agriculture. In this art many ancient people became very proficient. Considered from this point of view, it is probable that ancient agriculture reached as high a development as the best among modern nations. We have types of this to-day in the agriculture of China, Japan, India and Egypt. Neither mechanic arts nor science have contributed, except in a trifling degree, to its progress. It began as a manual art simply, and so it remained, practically unchanged, until the opening of the modern era. In every country, and in each district of all large countries, rules were gradually worked out which were found to serve in practice; and these were handed down from generation to generation. Intermingled with them were many superstitions—unfounded beliefs in regard to the action of certain supposed or real forces, natural or supernatural, upon the growth of crops. But it is a singular fact that the part played by these superstitions was but slightly, if at all, unfavorable in their effect upon results. They often made the work difficult and tedious; but men in all ages have had such an eye to the main chance that superstitious notions, while they might and did cause the expenditure of much needless work, were not of sufficient force to greatly lessen results. They did as much good, probably, in restraining waste of effort in vague experiment, as they did harm by inducing needless operations. Numbers of old agricultural maxims, superstitious as they now seem, were really well based, and embodied the observation of many in a pithy saying that endured, because it was in a way true. Slowly a body of facts was collected and transmitted that enabled well-trained farmers to so regulate their operations as to achieve success. As yet, our modern science has done more in recognizing and explaining ancient rules, and placing them upon intelligible bases, than in discovering valuable additions to them. It is only just now that the systematic collection and comparison of well observed and skillfully recorded facts have begun to lay the foundations of a new agriculture, in which a sound reason for doing a needed thing will supersede a grotesque or fanciful one.

When the activity of European effort was transferred across the Atlantic to America, new conditions were encountered that have not yet been rightly understood or surmounted. The eastern parts of North America much more closely resemble Eastern Asia than Western Europe. The consequences have been unfavorable to our agriculture. The maxims of European agricultural art did not fit American conditions; and the result has been that the wisdom of the ancients has seemed like folly among us. Setting aside the slight and slowly acquired knowledge of scant two centuries, under these strange conditions, it may be said that, as compared with the older nations, American farmers hardly possess any true art of agriculture. The European dogmas mislead us and we have worked out very few sound ones to replace them. This is both an injury and a benefit. It harms us to have no good empirical rules transmitted from father to son; but it benefits us to be comparatively free

from obstructive beliefs, which very slowly admit the clear light of demonstrative science.

The shifting character of our population, in its efforts to over-spread and occupy a vast virgin continent, acts continually to hinder the foundation of agricultural art. Our bountiful soil prevents our blunders from doing us the injury that otherwise might end in destructive and fatal loss; yet in the settlement of many new States the settlers have crept very close to the verge of starvation, for want of an acquired art of agriculture, adapted to their special conditions. Situated as we thus find ourselves, American farmers stand, in default of art, deeply in need of science, not only of general scientific knowledge, but of highly specialized knowledge, as made needful by local conditions. What will do in Dakota will not do at all in North Carolina. What is right for Florida is exactly wrong for Oregon. The essentials in Iowa are pernicious errors in Maine. Now, mankind seems, under some ill-recognized influence to have always builded more wisely than it knew; and have we not done so here in America in the foundation of agricultural colleges and experiment stations in every State and Territory of our Union? The plan has been much divided, and as a fact it has been yet but poorly carried out. But having no art, do we not, here in America, stand in especial need of a Science of Agriculture, and having the beginnings of these institutions, will not our needs, now being so rapidly realized, force their development, and drive us on to insure their success?

Everywhere.

LONG ISLAND NOTES.

FOREIGN MARKET-GARDENERS AND FARMERS SUPPLANTING AMERICANS.—The farms and market gardens in the close vicinity of New York City and Brooklyn are passing from the hands of their original owners, chiefly descendants of the English, into the hands of foreigners. This is due chiefly to the fact that Americans are unable to live as they have been accustomed to, and compete with the immigrants. Americans work themselves and hire all the labor they can pay for, while their families keep their houses in order; the children attend school and live and dress comparatively well. On the other hand, not only do their competitors work themselves, but they keep their whole families in the fields from early morning until late at night. Housework is neglected and school is not thought of during the busy season. What will be the final result of this evolutionary process? Will the level of farm labor go down, down, until it is on the same plane as that on which the tenant farmers of England and the peasantry of the Continent slave for a hard-earned and scanty livelihood, or will the foreign element become Americanized? The Germans, accustomed to hand labor, do not take kindly to the American way of doing things. A plow and a hoe seem to be about all the implements they require, and it is really suprising how clean they keep their ground with these tools. The secret of their success is persisent, continuous hard work.

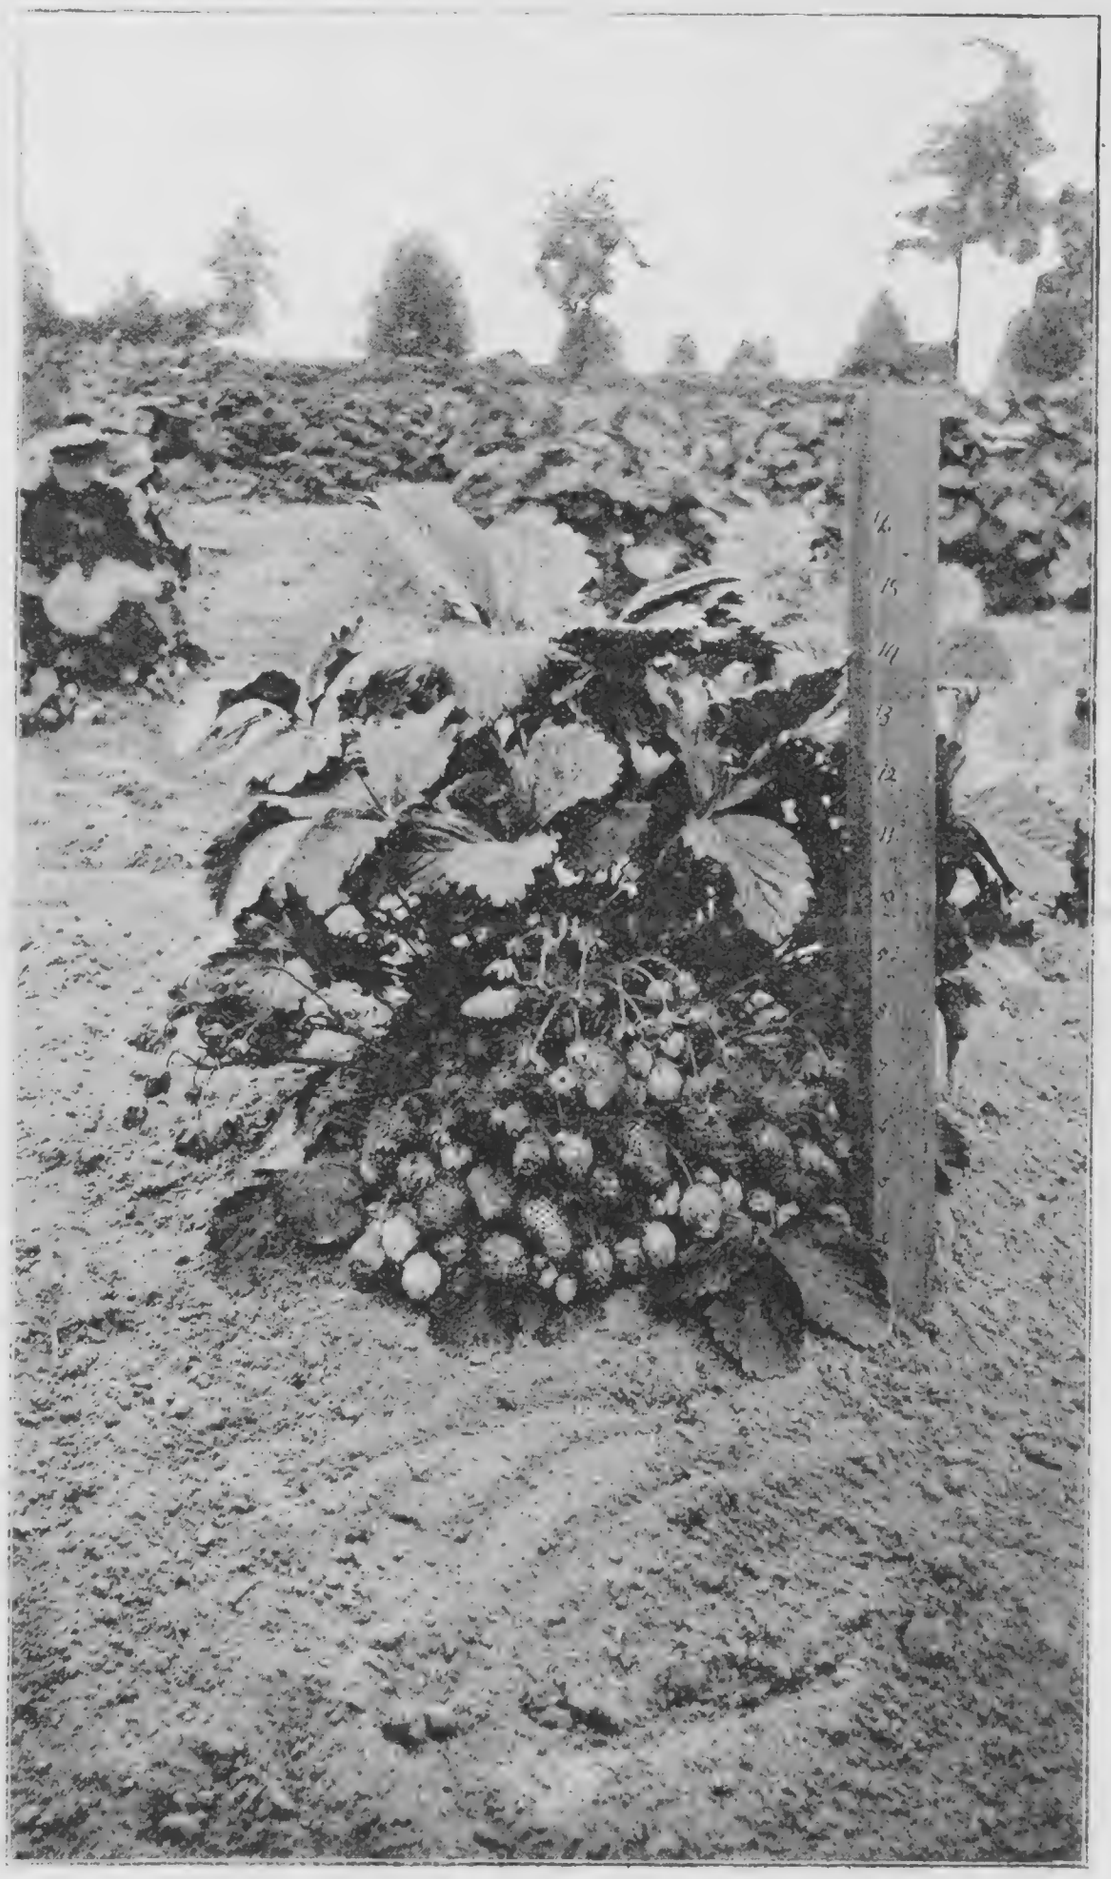
SCARCITY OF POTATO BEETLES.—For some reason the potatoes raised by the local market gardeners are comparatively free from potato bugs. It must be that early planting on very rich soil, causes so rank a growth as to make the vines distasteful to the pests. It may be that the application of London-purple very soon after the vines are up, with persistent hand-picking, is the secret of the scarcity of the bugs. At any rate, they are not nearly so troublesome in the market gardens as they are on the farms.

ASPARAGUS, for many years a profitable crop, has not brought enough in the city markets this year to pay the cost of cutting, bunching and marketing. The high prices of previous years had induced the planting of large quantities of this important vegetable, and the low prices will prove a great disappointment to the younger market gardeners. As usual when there is an over-production of anything, the large crop has glutted the market and the price has been hammered down to ruinous figures.

NEW VEGETABLES.—One of the effects of the introduction of foreign methods in market gardening has been a demand for vegetables not formerly grown to any great extent on Long Island. It is strange how quickly the city customer learns to appreciate a new vegetable. Leeks, cauliflower, kohl-rabi, salsify, Brussells Sprouts and a great variety of other vegetables now in common use, were seldom raised by the farmers of 20 years ago.

A BAD PRACTICE.—What is to prevent a potato grower from selecting some of the best tubers raised from any of the older varieties and calling it a new potato? I recently saw a plate of potatoes exhibited as a new variety. They were very large and handsome, but to the casual observer they did not differ in any respect from the Thorburn. This practice of giving a name to a mere variation of a well known and distinct variety and introducing it as something novel, is doing an immense amount of harm. It is carried to an extreme and should be stopped.

CROPS.—It may be news to some of the readers of the R. N.-Y. that on Long Island there are fields of grain a mile or more in length and that the harvesting methods of the West are followed here. I recently saw five mowing machines at work in one field, all mowing together. In an adjoining field five horse rakes were going. This was on the plains at Garden City. The crops this year seem very good. Corn, however, is an exception; it seems to have suffered from the wet and cold.



THE PARKER EARLE STRAWBERRY. From Nature. Fig. 181.

STRAWBERRIES.—Has there been any real improvement in these since the introduction of the Sharpless? Many of our leading growers have tried nearly all the new seedlings, only to return to the Sharpless as their chief market berry. I have a friend who picked 32 quarts of Sharpless from a small patch in a short time while he could not have gathered 10 quarts from all his other varieties put together.

THE SEVENTEEN-YEAR LOCUSTS have again appeared on the north side of the island. It is impossible to describe the condition of the forests after a visitation from these horrible pests. At times the trees seem fairly alive with them. The damage, however, is not as great as would at first appear. They eat off all the leaves and the trees turn yellow and look as though they were dead, but they come out the next season as fresh and green as ever.

THE FARM HELP PROBLEM.—The larger farmers on the east end of the Island are trying to get along with less help. They would solve the "farm help" problem by using the latest and best labor-saving implements. The Aspinwall potato planter and the Hudson Bicycle cultivator have taken the place of hand labor in the cultivation of potatoes. The result has been larger crops, produced at a much less cost than by the old methods.

A NEW POTATO DISEASE, if such it may be properly called, is known in some parts of the island as the "black stem." Opinions differ as to whether it is caused by wire-worms or by some sort of rot or fungus. Should it increase to any great extent, it will prove far more damaging to the potato crop than either the flea beetle or the potato bug.

RAVAGES OF THE ROSE-BUG.—The wholesale destruction of the foliage of the cherry trees by the rose-bug is likely to nearly or quite ruin the crop of cherries, and the pests may do even the trees irreparable injury.

GOOD WORK OF YE OLDEN TIME.—Mr. C. L. Allen of East Hinsdale, the well known horticulturist, has one of the finest libraries in this country. Among his books are works on horticulture printed in the Seventeenth Century. The illustrations in these ancient books are wonderfully true to nature; more so, Mr. Allen says, than the average drawings of the present time. It is rather humiliating to find that after two centuries of supposed development in floriculture and the engraver's art, we can find so few points of superiority in our modern books on the subject. RAMBLER.

RURAL SPECIAL REPORTS.

Kansas.

PARSONS, Labette County, July 2.—After a very wet spring and considerable loss from floods on the Neosho river and its feeders, we have had 10 or 12 days of warm weather which, while injurious to oats (causing rust) has given us time to finish the cultivation of crops and reap the wheat and oats. The crops of wheat, oats, small fruit of all kinds, vegetables, and grass will prove better than ever before known. We were just beginning to call for rain, when this morning, it came, and is now coming down—one of those rare rainfalls in Kansas, which fall gently and quietly and become absorbed as they fall. Early apples and peaches are just coming into market and selling at very low prices—apples and peaches at 30 to 40 cents per bushel.

Field corn will probably prove a big crop, even though some has been "laid by" in a weedy state. Kansas crops promise well in the aggregate, and low prices will be the rule if similar conditions prevail in other States. Corn is just beginning to tassel and may be considered somewhat earlier than usual, though there is great difference in the growth, some of it not being over two or three feet high, while some is eight or 10 feet. Many of our farmers consider that no particular benefits come to them from big crops, as such crops are followed by low prices, while small crops are followed by high prices. But it is certain that benefit will inure to the consumer. J. B.

Ohio.

BRISTOLVILLE, Trumbull County, July 5.—Hereabouts some depend upon the flax crop as the best crop for cash, as it brings ready pay for both seed and straw. The seed is mostly sold at Warren, Ohio, our county seat, where it is worked into oil, and the oil-cake is sold for feed. The seed has brought $1.10 per bushel, but the company has agreed to pay $1.50 per bushel for seed delivered before the 17th of August this year. The straw is bought in two places, each about eight miles from here. The price paid last season was $8 per ton. Wheat is raised to a considerable extent also, and is shipped on the railroad passing through this town. It brought $1 per bushel last fall and winter, but now it brings only about 90 cents per bushel. These are the most important crops that are raised around here, although some farmers raise some others on a small scale to sell for cash. Most farmers raise some stock for sale—hogs, cattle and sheep—but prices are very low at present. I do not know of any farmers around here who get better prices than those obtained by their neighbors. Prices of almost all products are lower than they were a few years ago, and the tendency seems to be downward, and the prospects are not very bright for farmers, as prices are low and money pretty scarce. The farming of this section has not changed very much within a decade. Farmers, however, do not keep so many dairy cows as they did a few years ago, while they raise more young stock and wheat. A decrease in the price of dairy products helped to cause the change. Otherwise farmers depend on about the same routine of crops as in the past. The prospects for farmers are not very bright around here, but we must keep on and try to do the best we can and hope for better times. It will not do for farmers to give up, even though prospects may not look very encouraging. J. S. B.

Texas.

DENISON, Grayson County, June 29.—In a journey of about 500 miles, which took me through portions of 13 counties in central northern Texas, I find the most promising crop conditions I have ever seen over the same extent of country.

Corn, with but few exceptions, is now in the roasting-ear condition with plenty of moisture in the soil to fully mature the crop, which will certainly be the largest ever produced in the State. The cotton crop prospects are also above the average. Some complain of too much rain for the bottom lands, which has prevented cultivation in places until the grass and weeds have such a start that some pieces have been abandoned. But farmers in the section referred to certainly have good cause to feel jubilant over their prospects. J. N.

WILL SORGHUM PAY?

Is sorghum a paying crop at $2 per ton of cane? That is, will an acre of land produce

as much money at this price for sorghum as it will in other crops?

FROM H. L. JONES.

Farmers cannot afford to raise and haul sorghum cane for $2 per ton—and it would not pay as well as ordinary farm crops, in the long run.

Salina, Kansas.

FROM D. K. GOODRICH.

There is not much sorghum raised in this section. I do not think it pays. Our main crops are corn, oats and hay. And then we have some creameries as fine as one would wish to look into, and it is through these we get our money back.

West Union, Iowa.

FROM JOHN ENFIELD.

An average of seven to 10 tons per acre is right, though 10 tons are nearer the average, some land bringing as high as 15 tons, as it is weighed at the mill—blades, tops and all. Farmers can afford to raise and haul sorghum, provided they do not have to haul it too far. A team can haul about one to 1½ ton per load. The greatest expense is the cost of hauling. Teams and men are worth about $2 per day. To raise and harvest sorghum costs about the same amount per acre as corn. Corn does not average more than 30 bushels per acre here, one year with another. It is now worth 20 to 25 cents per bushel—$6 to $7.50 per acre. Cane at 10 tons per acre and $2 per ton would bring $20 per acre for the same work needed for an acre of corn. The comparative profit in cane and corn, is represented by the difference between $7 50 per acre and $20, less the cost of hauling. If seven tons made the crop, the difference would be $7.50 to $14. Sorghum cannot be profitably hauled more than three miles, so mills should be located in the center of the cane fields. Cane does not exhaust the fertility of the land nearly as much as corn or any other grain crop. Both soil and climate seem to be peculiarly adapted to the sorghum plant in Kansas.

Mapleton, Kansas.

FROM J. E. MANS.

The sorghum mills located here pay $2 per ton for cane, seed included. The average yield is eight tons per acre. The farmer located within two miles of the mills can raise cane, though there is only one point in favor of doing so—quick returns for labor and money invested, as the cash is paid for the crop as soon as delivered. Last year I raised 23 tons 1,045 pounds of cane, (not for the Sugar Mill Co.,) not including seed, on two acres. This cane was manufactured at a local mill. I received 10 gallons of sirup per ton, for which I received 30 to 35 cents per gallon, at retail. The seed I had thrashed and the yield in all was 70 bushels, and I sold it at 50 cents per bushel. This crop was raised on bottom land. I had to haul it three miles. By keeping the seed I realized a better profit than would be possible with corn, wheat, oats or any other crop, except possibly when Old Hutch runs a corner.

Vidette, Kansas.

FROM J. E. HESTON.

I do not think sorghum pays as well as corn. It is of slow growth, and has to be hand-hoed at least twice, and a crop that would make from seven to 10 tons, would be extra. And an extra crop of corn would be from 60 to 75 bushels per acre, and it would supply fodder enough to keep a cow all winter, and corn at 25 cents per bushel. Then again, the tending can be all done with a plow. I do not think farmers can afford to raise and haul sorghum.

Mount Pleasant, Iowa.

FROM J. J. MARTIN.

Sorghum at $2 per ton would pay well where we did not have to haul it more than five miles and by having plants at different central points, farmers could supply the mills with all they could work up for the season when cane is to be taken care of. Farmers here, generally, are not very busy and what we would make would be almost clear gain, and again, sorghum has been a sure crop here, rain or no rain.

Pratt county is well adapted to sorghum raising and the county would assist and encourage a sorghum plant. It seems as though Secretary Rusk is the right man in the right place and one who means business for farmers.

Iuka, Kansas.

SPONTANEOUS COMBUSTION OF OVER-HEATED HAY IN THE MOW.

A., Westover, Md.—Is there danger of spontaneous combustion of hay from over-heating in the mow? If clover or Timothy hay gets too warm in the mow should air be admitted or excluded? Should the hay be opened or left alone "to sweat it out?"

ANSWERED BY HENRY STEWART.

The possibility of spontaneous combustion of hay is a much disputed question. There is every reason scientifically to disbelieve this possibility, and so far as known there has never been a clearly established fact to prove it in practice. Combustion is caused by active oxidation. This oxidation in a mass of closely packed hay will begin no doubt when the hay is damp, and fermentation occurs, which is inevitable under usual conditions. But the oxidation cannot go further than the supply of oxygen in the substance of the hay will permit, which is no more than to carry the heat up to 120 degrees or perhaps 140 This heat always occurs in the silo, but no silo as yet ever burned by spontaneous combustion because combustion cannot occur at any temperature produced in any moist or damp substance until it has become quite dry and is exposed to a free current of air. Spontaneous combustion may, and often does, occur in oily cotton rags, but the chemical action is then very intense because of the large quantity of oxygen in the stuff, its porous character and the easy access of air which supplies all the oxygen needed for active combustion. These requisite conditions are not present in a mass of closely packed hay, and combustion is easily prevented by keeping the mass pressed down and by not disturbing it. The heat then never exceeds a point of safety or such as will merely discolor the hay and cause it to become brown. This does not injure the hay but makes it more palatable and digestible, in the same way that the heating of silage under similar conditions changes its digestibility and makes it somewhat better for feeding than the green fodder is. Salt is an obstacle to fermentation and a liberal sprinkling of it on the hay when it is unavoidably packed away in a damp condition, will decrease the fermentation and prevent any injurious excess of it.

Spontaneous combustion of hay in the stack or mow, I believe, to be as much a myth as the spontaneous combustion of persons who have soaked themselves with alcohol, and which has been alleged to have occurred in some cases. Ancient stories to this effect have been current but without any evidence other than popular superstition; no medical evidence of any kind has been brought to support this belief which was as common 40 or 50 years ago as the belief of spontaneous combustion of hay is to-day. Cases have occurred in which the hay, especially clover, has been found blackened even, in the stack, but this change is exactly similar to the slow carbonization of leaf mold, or swamp muck or vegetable matter in the damp woods, and not to any actual excessive heating to a point when combustion or charring could have occurred. Where I am now residing the climate is very damp, the annual rain-fall exceeds 60 inches and sometimes amounts to over 100 inches, consequently it is impossible to dry hay in the field and it always goes into the stack or barn, damp and sometimes moist, but although it has heated very much, I have not found it to exceed 140 degrees at the worst, and as it packs closely by reason of the dampness, this heat is retained for weeks; but no case of combustion has ever been known or even alleged here. If hay so heated is left undisturbed it will not burn, but will cool off gradually, the moisture often being deposited in drops like dew on the surface of the mass. Sometimes a sort of mildew which appears like fine dust or white smoke escapes from such hay when it is opened after it has cooled, but as long as the hay is not disturbed and it is kept from access of air in a tight barn even this mildew rarely amounts to inconvenience or injury; while salting will prevent it.

HYDATID OR TUMOR ON THE BRAIN IN CALVES.

H. M. G., Well's Tannery, Pa.—Two three-month-old calves died here lately from some ailment with the following symptoms: They seemed to become blind and walk round and round in a circle. If they came against any object they would push it down if they could, and continue the circular movement. Occasionally they would stop and turn their heads round to the right side, then start and run as though trying to get away from something they feared. One of them ran against a fence, pushed it down and crossed over; then wheeled and came against it again, pushed it down again and crossed over as before; and did the same thing several more times, all the while keeping up the circular motion. During a paroxysm each bawled as if caught by a dog, fell down and was unable to get up again. On examination after death, part of the smaller intestines were found nearly black, and the kidneys were also discolored and one was much larger than the other. They were both large and fat. They had been on grass all spring, and had plenty of skimmed milk and wheat bran. They appeared in good health till the attack became noticeable. What was the matter?

ANSWERED BY DR. F. L. KILBORNE.

The symptoms indicate pressure on the brain, as from a tumor, ruptured vessel, or the presence of a parasite or hydatid, the Cœnurus cerebralis or cystic form of the Tœnia cœnurus, a tapeworm of the dog, the immature form of which lives in a cyst in the brains of sheep and young cattle. The embryo in this cyst when eaten by a dog develops into the tapeworm or mature form. The eggs passed by the dog are eaten by the calf or sheep with its food, the embryo making its way to the brain where it produces the disease commonly known as "gid," "sturdy" or "staggers." This parasitic disease is met with quite commonly in sheep in some countries, and less commonly in young cattle. Killing all stray dogs or worthless curs will prevent a large proportion of the cases of this as well as other similar diseases. In the hands of a skillful operator an operation is sometimes possible by which the parasite may be removed. But the simplest and best course to pursue usually is to send the calf immediately to the butcher, the meat being perfectly wholesome for food.

CHRONIC NASAL DISCHARGE, OR GLANDERS, IN A HORSE.

M. M., Fergus Falls, Dak.—In No. 2042 of the RURAL I got some information about an ailing horse of mine. Since then he has not improved very fast. He has a fastidious appetite and does not seem to get any strength from what he eats. He is fed one feed of oats and one of bran mash, gets once in a while a feed of carrots and has for the last 14 days had the benefit of the new, fresh grass. He is still discharging through the nose a thin slimy stuff, which is, after feeding, mixed with some of his cud, which returns through the nose. Also when he drinks, the water returns through his nose. There is no sore at all in the nose He has a kind of hoarse, deep cough, and when he neighs the sound is hoarse and unnatural. His eyes look bright, he is not inclined to move around except at a walk, but every day he rolls himself in the pasture. His winter hair is shedding, but not as quickly as usual; his coat is hard to groom. Any further advice with regard to him?

ANSWERED BY DR. F. L. KILBORNE.

If there is a veterinary surgeon at hand you had better have the horse examined to make sure it is not a case of glanders. If you cannot well have such examination made, watch for ulceration well up in the nose; such ulceration is a pretty sure indication of glanders, when the horse should be destroyed at once. In the meantime the nose might be injected daily with a solution of one dram each of sulphate of zinc and carbolic acid, with two ounces of glycerine, dissolved in a quart of water. When used the solution should be milk-warm, and injected with a nasal siphon made especially for the purpose, or with a piece of half-inch or inch hard rubber tubing three feet long, and a funnel in one end. Insert the siphon or free end of the tube into one nostril, pack around with cotton, and inject until the solution comes from the other nostril. Repeat on the other side. The general condition may be improved by giving two table-spoonfuls of the following powders in the feed twice daily:—Sulphate of soda and gentian each one-half pound; powdered nux vomica one ounce.

OBSTRUCTION IN A COW'S THROAT; RETAINED AFTERBIRTH IN A COW.

S. L. T., Fairfield, Neb.—1. When one of my cows dropped her calf in the spring of '88 she was thin in flesh, and would bellow as if there was in her throat something which she was trying to get rid of, and this habit has continued ever since. In the spring of this year she had another calf, and is now giving a good mess of milk. Can anything be done for her? 2. What should be the treatment of a cow which doesn't get rid of the placenta soon after calving?

ANSWERED BY DR. F. L. KILBORNE.

1. Apply the following strong liniment over the region of the throat once daily until the skin is quite well blistered: Equal parts of strong aqua ammonia, sweet or raw linseed oil, and oil of turpentine well shaken together. If you can feel any swelling or lump about the throat blister it more severely. 2. If the afterbirth does not come away in 18 to 24 hours it should be carefully removed, before the neck of the womb has closed so as to prevent the introduction of the hand. Grasp the protruding mass of membranes in the left hand and pull gently from side to side. Insert the well soaped or oiled right hand into the womb, and with thumb and fingers carefully squeeze out or separate each attachment or cotyledon (about 50 in number when complete) being careful not to tear the buttons or cotyledons from the womb. When all are separated the membranes will readily come away. After the removal of the afterbirth, wash out the womb with tepid water, and finally, inject a weak antiseptic solution—one dram of carbolic acid or of sulphate of zinc dissolved in a pint of water, may be used for this purpose. A piece of soft rubber tubing three or four feet long and one-half inch in diameter, with a six-inch funnel in one end, will be found very convenient in washing out and injecting the womb. If a discharge continues after the operation, inject the antiseptic solution once daily until the discharge ceases.

HOTEL SLOPS AS HOG FEED.

F. D. P., Asheville, N. C.—I want to feed 125 hogs and have about 100 acres of woodland pasture for them. I can get enough ordinary hotel slops at the town four miles away, to feed from 100 to 150 animals, with the addition of this pasture. To deliver the slops at the pasture would cost $350 a year. Would it be cheaper to haul the slops or spend the same amount of money for corn and oats? I can buy the corn for about 45 cents per bushel and the oats for 34 to 40 cents in the fall. Are slop-fed hogs more liable to cholera than those that are grain-fed, both having a large pasture to run in and plenty of fresh water? Of the 125 head at least 100 would be three months old on February 1.

ANS.—Hotel slop usually contains the best of all food for swine, being composed of both vegetable and animal matter. It consists of about the right proportions of nitrogenous and carbonaceous elements for the production of the best kind of meat, with a proper proportion of lean and fat intermingled and not laid on in alternate layers. Pigs fed upon it have been made to reach a dressed weight of 250 to 350 pounds in nine or 10 months. If the slop costs nothing but the hauling, the expense of food would amount to less than $3 per head which, with the charges for attention, would make the pork cost less than three cents per pound. This is much less than the cost by feeding grain at the prices mentioned, which would be at least five cents per pound under the most careful management. As diseases in swine are chiefly produced by excessive grain feeding and the slop will probably be a much better balanced food in regard to the right elements of nutrition, there should be no danger of cholera (intestinal fever) by the feeding of this slop.

INJURY TO FETLOCK JOINT OF HORSE, FOLLOWED BY BONY DEPOSIT.

W. A. S., Manchester, Iowa.—My six-year old horse injured his left hind leg on a barbed wire fence when a colt. The ankle joint became swollen, but the animal didn't become lame till driven on the road three years ago, when he went lame so badly that I couldn't use him. The swollen ankle became hard, and though fired and blistered still remains in that condition. Can anything remove the evil?

ANS.—A personal examination would be necessary to enable us to advise a very satisfactory course of treatment in a chronic case of this kind, that has been repeatedly treated by such active measures as firing and blistering. From a description we cannot tell whether the present condition is due to the injury itself or to an improper course of treatment when first injured. The latter is very often the case. Firing again by a competent operator followed by an active blister, would probably be the course most likely to produce favorable results. A complete recovery cannot now be expected.

SWELLED JAW WITH ABSCESS IN STEER.

L. S., Prescott, Washington Ter.—Among 220 head of cattle one four-year-old steer has a swollen lower jaw, and emits a yellow, sticky fluid from its nostrils. Some neighbors say I ought to cut open the place and scrape the bone; others think I ought to kill and bury it. What does the RURAL say?

ANS.—If you have reason to believe the animal has "lump jaw" or "big jaw"—actinomycosis—it would be best to destroy him at once because the disease is communicable by inoculation not only to other cattle but to man. Your description of the symptons indicate actino-mycosis, a parasitic fungus, as the probable cause of the disease. It would be a safe precaution to destroy the animal, and burn the head. The flesh of such an animal should not be used for food. If the swelling and discharge are due to an injury the proper treatment would be to open the abscess, scrape the bone if found diseased, and then treat as an open sore.

POLYPUS OR TUMOR IN TEAT OF COW.

D. F. C., Sandwich, Ill.—There's an obstruction in one of the teats of a young cow that dropped her second calf two weeks ago.

It is quite hard and about the size of a grain of wheat and appears to be movable. It drops down in the milk duct and nearly closes the opening, often doing so altogether, so that milking is a tedious business. With a little manipulation it can be gradually forced up the teat into the udder. How can it be removed?

ANS.—Relax the teat in a warm solution of belladonna, and then insert a steel loop or a small instrument with an eye large enough to slip over the tumor and twist it off. Failing in this, an incision may be made through the side of the teat, the tumor twisted off and the wound carefully sewed up. In this case the milk should be drawn through a milking tube until the wound is healed.

THE SILO FOR GRASS.

S. S. M., Rossmore, Ont., Can.—All I have read about ensilage relates to corn silage; isn't the silo a good place for preserving hay, or rather grass, both clover and Timothy? We are having very wet weather here and if it continue there will be little chance of curing hay in the ordinary way.

ANS.—In England grass and clover are used almost exclusively as silo crops. Corn does not do so well in England. This accounts for the difference frequently shown in analyses of English and American silage. Many Western dairymen are using clover in the silo. Prof. Henry, of Wisconsin, has sent us samples of clover silage that were excellent in quality. We have never seen silage made from Timothy, but we see no reason why it should not be good.

PREMATURE SHEDDING OF MULE'S HAIR IN SPRING.

M. R. B., Meade Center, Kan—The hair of a mule comes off every spring so that he looks as if he were shaved. In other respects he is all right. What is the trouble?

ANS.—Probably the general condition of the mule's system in the spring is such that he sheds his winter coat prematurely before the spring coat is ready to appear. If there is no eruption or itching of the skin no treatment is necessary. Possibly a good purging earlier in the spring (with five to eight drams of aloes) followed by alkalies (the carbonate of potash or soda in half-ounce doses daily) might bring the shedding and growth together as it should occur. A restricted diet with little or no corn or other heating agents would also favor a return to the natural method.

WHEN TO PRUNE.

P. S. W., Salem, South Dakota.—At what time in the year should fruit, willow and shade trees be trimmed? How high should fruit trees be pruned?

ANS.—The wounds caused by pruning will heal up as well if the trees are pruned in midsummer as at any other time. As a rule, we should prefer late fall pruning for your climate. The R. N.-Y.'s preference is to prune fruit trees so that the trunks may be protected in a measure from the heat of a midsummer sun. That is, we do not approve of pruning high.

Miscellaneous.

G. L. P., West Farmington, Me.—The value of the rock, of which you inclose specimens, is just what it is worth for building purposes. It is iron pyrites, sometimes called "fools' gold."

L. C. L. J., New York City.—How can I get rid of grasshoppers on trees in a garden? They eat holes in all the plants, but do not touch a mash of bran, sugar and arsenic.

ANS.—We should try spraying the plants with hellebore—one heaping table-spoonful to two gallons of water. Make a paste of the powder by adding hot water. Then stir it in the cold water.

Subscriber (address mislaid).—Is an aneroid barometer good on the farm as a weather indicator?

ANS.—An aneroid barometer is said to be about as good as any. No barometer, however, will forecast the weather with accuracy; such articles are only valuable in connection with observations of the wind, sky and temperature. It does not pay to spend much time in watching a barometer or thermometer. A great many people spend so much time watching for a storm as not to be prepared for it when it does come.

W. E. R., Dover, N. H.—My 20-year-old mare weighs 950 pounds, and is an excellent roadster. She is in splendid shape and condition and apparently good for years. Would it be advisable to try to raise a colt from her?

ANS.—Twenty years is not an extreme age for a mare to breed. The noted Goldsmith Maid was older than that when she had her first colt, and it is more than probable that your mare will be prolific. A horse that has been well cared for is quite likely to live 30 years in useful condition, and is therefore not older at 20 in proportion than a person of 40 years.

DISCUSSION.

THE MOON AS A WEATHER INDICATOR.

J. T. B., HUSTONVILLE, KY.—The weather during the last quarter of the moon is a forecast of that which will prevail during the next three weeks—at all seasons. My observation leads me to place almost implicit reliance on this rule, and I am convinced that it is applicable to neighborhoods if not to farms. Temperature, sunshine, clouds, winds, rains, snows, etc., are relatively proportionate throughout the four phases of the moon, beginning with the last quarter. The variation is of degree rather than of kind One summer four seasonable weekly showers fell on neighboring farms north of me, and not once did enough fall to "lay the dust" on mine. Another year the same thing happened south of me. Each time the first rain to pass me was in the last quarter of the moon. My conclusion from limited notes is that the weather of the last quarter is nearly always the most pronounced. My notes have not been regular or systematic, but they have been sufficient to arouse a lively interest in the weather during the last quarter of the moon. With us the drought of '87 began and closed in the last quarter of the moon. Of the multitude of weather signs current, and the scores of weather prophets the white-caps and fool-killers have skipped, I take no stock unless their predictions are corroborated by the condition of the weather during the last quarter; for the "failure of all signs in dry weather" hinges thereon. Nineteen years ago my wife and I set up house-keeping, and before our garden began to give us anything for the table we discovered that fertilizers and showers of rain on alternate days were necessary to a successful competition with more fortunate and experienced neighbors, and I began the study of weather signs, watching and hoping for the rain while casting about for the fertilizers for the next crop. One afternoon indications of a long-looked-for and much-needed rain were excellent, but evening came and still no rain fell, though a heavy bank in the west sustained hope. I observed to a friend: "We'll have rain to-night." "No," said he, "since my attention was directed to it I have never seen a spell of dry weather broken by a rain at night, however flattering the indications." I have never seen an exception to this rule. Subsequently I was sitting on the front veranda at a neighbor's when a drought was on, and he observed: "We'll have rain within 24 hours." "Why?" I asked; "Why," he answered, "lightning in a clear north sky is a sure sign." I have never known that sign to fail; but I have not watched it closely. When the cloud is visible in the north the indication is uncertain. In an interview with Prof. Tice in the 70's, I was surprised to find so many of our weather signs new to him, and I have concluded that Josh Billings's Almanac was about the best all-round weather maker that I ever consulted. It is astounding to find such abiding confidence in the weather indications of patent medicine almanacs as well as in their claims for their stuff; for, "experience is the school in which even fools are presumed to learn something." Whilst I write, the rain is so heavy north as to obscure the groves a mile away, and 'tis scarcely dripping from the eaves here. This is a repetition of last week's experience during the last quarter of the moon.

BUILDING UP A DAIRY HERD.

G. W. H., ROCHESTER, MASS.—Some months ago I gave the butter record of 12 grade Jerseys—3,777 pounds for 12 months. I am asked to state more about the herd. For the last 25 years thoroughbred Jersey bulls have been used. About 14 years ago a grade heifer was found to make butter of Guernsey yellowness, and she could make two pounds per day. She also held her milk well as she could be milked nearly all the time. She was taken as the mother of the herd, and bred to Jersey bulls. Ten of her descendants are now in milk, and are extra-good butter-makers. Several of them will make fully 365 pounds in a year. One made 17 ounces from six quarts of milk in a day, when due to come in in 30 days—another was put into the barn, and fed upon dry hay in order to dry her off when nearly ready to calve. She is now giving a little over eight quarts of milk per day—enough for more than a pound of butter—and has been in milk over two years, and is due to calve in September. Another is just out of milk, but not dry. She is due to calve in nine days. One two-year-old now in milk bids fair to equal any of them. he is a granddaughter of the old cow her sire and mother being half brother and sister. I have five younger ones which look promising. I have a bull over a year old, son of the old cow, sired by a pure-bred Jersey of noted strain, which I have used as far as I think prudent on account of his near relationship. The blood in the veins of this herd must be nearly all Jersey, and I shall now use a Guernsey bull—a calf from the celebrated Millwood herd of Framingham, Mass.

This bull has an extra butter record back of him, consequently I look for a still further improvement. I am confident that a careful start, intelligent breeding, a vigorous selection of the fittest, liberal feeding, and kind treatment would in 10 years double the butter product per cow of the country. In the account which I gave, the herd averaged about 314 pounds of butter for the year. At that time only nine, including the old mother of the family, were included, else the showing would have been even better. Five more have been added to the herd this year and the record has improved although they are only heifers.

H. C. E., SANDWICH, MASS.—Here is what I believe to be very effectual in driving the flea-beetles off, if it does nothing else. It is the plaster and kerosene mixture recommended for squash vines, viz.: To every quart of the plaster add a great spoonful of kerosene. I have added, however, a one-third more. If this is sprinkled on potato vines it will drive the beetles off. The finer the plaster the better. A very great quantity is not required.

LODGED WHEAT.

W. L. D., CLYDE, N. Y.—From the frequency of extraordinarily heavy rains and much wind, wheat has been subjected to an unusual test of its strength of stem. If grown—constructed—out of a soil where there was an abundance of nitrogen, the structure of the stems is faulty or weak, and the wheat lodges badly. Now, a heavy piece of wheat is usually considered a pleasing thing for the farmer, even if lodged; but it is often a wasteful growth, including wastage of fertility. The straw is weak and soft, seeming to lack in phosphate of lime, and the growth being protuse and quick the cellular tissue is perhaps put together with too little silex. The grain also shrinks so much that its selling price is lowered and indeed it is of poor quality. Wheat which has been down several days from the force of heavy storms at the blooming time or just after, is injured even though it may rise again; while that which does not recover yields shrunken grain equal to that "pungled" by the weevil, if it yields much of anything. Inquiry is always made by millers about the lodging of wheat, and this year in many sections, local millers have declared the prospect is poor for good wheat, and a No. 1 price will not be paid. To be sure there is a loss in over-enriching the soil for some crops—for wheat for instance.

One of the features in this matter is spot fertilizing, from which arise little lodged patches presenting a dotted appearance in a field of grain. This comes from the careless application of barn-yard manure, generally due to drawing and placing it in the field in small piles some length of time before plowing; thus some spots receive too much of the nitrogenous stuff and others not enough. It is quite certain that there would have been less loss by spreading it immediately and, where possible, surface application is the best way of doing so with thorough harrowing; for in this way spot fertilizing of high-grade fertilizers in over-doses, occasions the same results—over-balanced growth, poor grain or no grain. An over-dose of phosphoric acid or potash would not in this respect work the damage that ammonia would. It seems very properly that in almost all formulas for superphosphates, the immediately available mineral constituents exceed the nitrogenous in supply. This is safe. In an extravagant use of fertilizers for good results, there is much danger of over-reaching. One should distribute the fertilizer so as to bring every square rod up to an even standard. Let us try to get a big wheat crop, yet not the biggest. Keep on the lesser side where the growth stands up.

MORE "WEATHER-WISE" FOLKS

F. S. W., DES MOINES, IOWA.—I have no signs for telling the coming weather. I never pay any attention to such things. I have the assurance from inspiration that so long as time lasts, we are to have seed-time and harvest, winter and summer and also wet and dry weather. Now, it has always been my plan to try to have work for all these various conditions of the weather. If I prepare a piece of land to-day to be planted to certain kinds of seed to-morrow, and it rains to-night and makes the land too wet to plant, I do something else until the weather and ground are right for planting. While I am on this subject, let me say that I never plant anything in the moon, as I always plant in the earth. At this busy season to be successful in farming, we must know how to economize every moment. When it is too wet to use the horse cultivator, there are places where the hand hoe can be used, or plants can be set out, or the weedy fence corners and walks can be cleaned up. Pig-pens, barns and tools can be looked after and repaired and cleaned up. When the cold weather comes, there is still plenty to do, wood to chop and haul, manure to be hauled out and other things can be done so that we can be kept busy in all kinds of weather. I am aware of the fact that our Signal Service is enabled by working on scientific principles, by numerous observations over a wide area and constant practice, to tell what the weather will be to-morrow, but to do so is a task too heavy for me. If we farmers could have daily access to the Signal Service bulletins, they might be of great help to us in planning our work ahead; but these bulletins are posted up in the city in the Post-office, and at this busy season there are many farmers who do not get to the city more than once in a week. Until we can have better access to this only source of reliable weather indication, we had better adapt ourselves to the weather, instead of trying to adapt the weather to our wants; paying attention to old signs and moon changes—which do not amount to anything. "Christian Science," "faith cures," and weather signs, or anything else which is not based on scientific reasoning I have no use for.

"ALL SORTS."

S. H. C., HARKNESS, N. Y.—The contest plot of potatoes that my wife planted or helped to plant, as she cut the seed pieces and dropped them, is looking fine. I never saw so many stalks, or larger, healthier-looking ones. I am afraid the tops are too large. The flea-beetles have not hurt them much. They seem to come too early to do much damage. The contest plot was planted May 6, and my field of about five acres on the 10th and 11th. When planting them, if the pieces lay any time, say 20 minutes, before they were covered with earth, they would be covered with the beetles. I was afraid the latter would injure the seed, but now I do not think they did any damage, as the vines are covering the ground and are covered with blossoms. Why is it that I never have any seed-balls? One of my neighbors who planted early, told me that when he cultivated his they were covered with beetles. He had a rather long whiffletree that brushed the vines or tops some, and he could see the little fellows flying off. They seemed to go down on the ground and the cultivator covered them. He has seen only very few since. He thinks that killed them. I have seen very little of their work in my fields and we have not had as many of the Colorado beetles as usual. Perhaps the weather has had something to do with their work as well as with mine. I cut potatoes for planting May 8, and the mercury stood 94 degrees in the shade. Last Monday there was a promise of a few days' good weather and I cut five acres of newly seeded grass, mostly clover and a very good crop. I raked a part, and on Tuesday I finished raking, and drew in one load and found it too green. Tuesday night it rained hard, wet it through and yesterday I spent all day trying to dry it. I got it partly dry and some of it in bunches, the rest in windrows that had been turned. This morning when I woke up it was raining and it is raining now.

EARTH-CLOSET DEPOSITS AS MANURE.

W G. W., TYRONE, PA.—E. S. Gilbert tells us that the accumulation from an earth-closet spread on a piece of meadow produced scarcely any perceptible improvement on the grass growth. The same want of early effect has resulted here, but the ground has yielded very well ever since where an application was made several years ago. Dr. Caldwell says that the earth from the closet has very little manurial value, even when it has been used for the closet two or three times over. It is strange that analysis should give no better account of what is almost the sole reliance of the best gardeners in the world—the Chinese and Japanese. We all know what a close and careful keeper earth is of all manurial matter committed to its keeping. Apparently it gives from its stores year by year only so much of phosphoric acid and potash as the plants in the ground can use during their growth, and this seems to be measured and limited by the amount of nitrogen which the plants get. This, too, is measured out to them, and with even greater strictness, for the nitrogen must pass through a preparatory ferment which can take place only in a rare combination of weather influences on comparatively a few days of each year, and to a limited extent. If the earth could freely give up its means for vegetable growth it would be soon exhausted. Famine and death would soon follow an inordinate feast, and the earth would become the

grave of all that feed and live upon it. Is not this wise ordainment by which first plants and then animals get their daily bread and no more from year to year, the explanation why closet dejections composted with earth give to the vegetation where they are placed, only a moderate augmentation of growth in any one year. The nitrogen has been locked up, to be given out again but slowly. The Asiatics use the manure in a nearly fresh condition and so get more from it the first season.

CATTLE NOTES, ETC.

W. E. R., DOVER, N. H.—I have used sawdust in the stable three or four years, and had rather have dry pine sawdust than anything else. It makes a good bed and can be kept under cows better than other kinds of bedding. It is a good absorbent and with it the cow manure can be handled much more easily and made a good deal finer than when it is not used, and that I think is worth something, as the finer the manure is the better it suits me.

"What will cure warts on cows" is often asked, so I will tell how I get rid of them. A yearling Guernsey heifer had one somewhat larger than a silver dollar on her belly a little forward of her bag. I took a piece of fine strong shoe thread a foot or so long, and tied it close to the belly, in a knot that would not slip, and drew it pretty hard. Every day or so I drew the thread a little harder, and in a few weeks the wart was gone and I could not tell where it was taken off. Sometimes there will be one on a cow's teat; I twist it with my fingers a few times, and it is gone. I can get rid of them in this way without waiting for the cow to be dry.

For seeding down good strong mowing land I use half a bushel of Timothy, one bushel of Red-top and 10 pounds of clover. Can any one give a better mixture? I have sown some in the early fall. Some say that if sown at any time before September, clover will do well, but I get a better stand by sowing in spring with or without grain.

PROTECTING CATTLE FROM FLIES.

A. L. C., CATONSVILLE, MD.—I know of no way by which cattle may be protected from flies while in the field unless they be entirely covered with sheeting or netting, and how short a time this would last if put on I have not had curiosity enough to find out by trial. If there is a wood lot with plenty of underbrush in it adjoining the pasture, the cattle will go there to brush off the flies, rest and ruminate, then go to the field for a fresh supply of feed.

I tried Lawford's Sheep Dip on a bull tethered out, but it did little good; in a short time after applying it the flies would cover him as thickly as ever, although I mixed the dip very strong. While on the subject of flies, I will mention the invention of a friend of mine which he uses while milking. It is in the shape of a large sack ripped down one side and put on the cow coming well down nearly to her feet. Every part except her head being covered, she has no occasion to switch her tail and she couldn't switch it if she wanted, which is a great relief to the milker.

A slit can be cut in the cover opposite the udder so as to allow easy access for milking.

GROWTH OF WHITE CLOVER.

O. S. B., MONMOUTH, ILL.—In the Grass Number of the RURAL in which many of the various kinds of grasses were mentioned and their characteristics, merits and demerits described, I notice "White clover" represented as growing from four to six inches high, and as the opinion of the writer of that article and my own do not agree, I inclose a sample of the aforesaid clover which will illustrate my ideas of it. This sample was taken from my pasture of 200 acres, on which I have pastured, since March 21, 100 head of cattle one year old and over, and 21 head of horses two years old and over. The pasture has never been plowed or cultivated in any manner, and is seeded to a volunteer growth of Blue grass and White clover. The Blue grass stands from two to 4½ feet high. I have seen Blue grass over six feet high. If stock is lying low on level land a man on horse-back must approach within 15 to 20 rods, and many times much nearer, before he can find them. All kinds of grain and fruit in this part of the State are very promising at present.

R. N.-Y.—The bunch of clover stems and heads received average two feet in hight.

W. F. A., EAST HARTFORD, CONN.—The Early Essex potato has again proved its superiority as an early variety, beating the record of this or any other potato. E. E. Gardy, of South Windsor, Conn., marketed fully grown and apparently fully ripe potatoes on June 21, planted April 17, under ordinary field culture, with Bradley's Potato fertilizer alone. These potatoes were dug on the 66th day from planting, which is most remarkable considering that it is in the earlier part of the season. Several growers will begin marketing this variety to-day—June 24. Mr. Gardy says his entire field is ready to be dug, and he estimates the yield at 200 bushels per acre at this date.

What Others Say.

BUTTER FROM JERSEY AND LOW-GRADE COWS:—At the meeting of the N. Y. Dairymen's Association held at Walton, Delaware County, after explaining the objects of the society and making clear the native, chemical composition and parts played by each of the constituents of milk, cream and butter, the object-lesson proper was given. As we glean from the Philadelphia Weekly Press, the cream from 200 pounds of milk, representing four-fifths of one day's milking of 21 grade Jersey cows, was dumped into a rectangular churn, which was revolved at the rate of 48 revolutions a minute for 20 minutes. Then the buttermilk was drawn off, the butter treated with strong brine, again washed with water, the butter skimmed off and placed on the worker. After being worked for a few minutes and salted at the rate of an ounce to the pound the butter was found to weigh 13¼ pounds. It proved to be excellent in color and taste. In the afternoon a similar test was made of the cream from a like quantity of milk from a dairy of 17 low-grade cows, including but a small proportion of the Jersey strain. The churn was made to revolve 56 times a minute, and brought butter in 16 minutes. This lot of butter was good in quality, but it weighed only seven and a half pounds. The difference shown in favor of the Jerseys was a striking demonstration to all present, particularly to the owner of the scrub dairy. It spoke volumes in favor of the special-purpose cows of good breeding. This would have been clearer, however, if the total quantity of milk given by the low-grade cows had been stated, for while 200 pounds of Jersey milk may make twice as much butter as 200 pounds of Holstein milk, for instance, still if the Holstein cows give twice as much milk as the Jerseys, there is an equal quantity of butter and twice the quantity of skim-milk in favor of the Holsteins. Still there is no doubting the fact that the majority of farmers in New York State, as well as in other States, are not living up to their privileges as dairymen and there is a broad field for just such effort as the New York Association is making to place the cold facts before them.

RIPENING CREAM:—Col. F. D. Curtis never churns his cream less than 24 hours old, and he aims to have it 48 hours old, and tries to keep it in such a condition, that it will be 48 hours old. It is then only slightly acid. This helps the process of separating the butter globules. When the cream is properly ripened, it speaks for itself. It looks light-colored, and has a bright, satiny appearance, cracks open on the top, and you can almost see the butter right in the cream. As soon as it reaches this point, it wants to be churned right then and there.

Now the great trouble with the average dairyman is he doesn't observe these things closely enough. He does not skim the milk properly, and the cream is kept too long.

Col. Curtis would not put old cream with sweet cream. Warm your cream up to about 75 degrees, but sourness does not ripen the cream. By a little neglect in ripening the cream, you can not get all your butter. He has no doubt that he has lost 5,000 pounds of butter during the last 10 years by not ripening his cream properly. He would get his cream partially ripened, put his sweet cream in, and let the whole ripen. By repeated experiments he found by these means he had been losing about 10 per cent. of his butter. By ripening his cream together, he has no trouble in getting at least 10 per cent. more butter than he ever did by the old method, and he attributes this loss entirely to the ripening.

SPICE.

FLOWERS OF SULPHUR, retail price about 10 cts. per pound. Tobacco dust, an excellent remedy for lice, etc., also retails at 10 cts. the pound The price of flowers of sulphur by the 100 pounds is about $4 50. Tobacco stems are steeped in water and the water sprayed upon infested plants will rid them of aphidæ etc. These stems are offered at $2.00 per 100 pounds in bales.....

THE Caledonian of St. Johnsbury, Vermont, evidently thinks that farming pays in that locality. It says that beginning at a farm half a mile outside the limits of the village, and following that line all the way to the next town, a distance of 12 miles, there are 11 contiguous farms. On every one of these farms the owner has not only been able to get a living, but all have laid up money, and the owner of every one is now what might be called forehanded. Several of these men are worth from $10,000 to 15,000 each, while one of them is worth at least $30,000, and this has been made off the farms on which they now live.....

THE price of transplanted celery plants is now about $6.50 per 1.000; of cabbage plants $6 00 per 1,000.....

A FRENCH physician, Dr. P. Jacquin, insists that a child that has a cough should always be kept in bed, or at least in a warm room constantly free from drafts, and that there is no safety in any other course. This is reasonable, for as cold is caught from a sudden chill of some local part of the body, while we escape colds if the chill affects the whole body equally, (as when we are at sea, or moving about briskly in all directions during chilly weather on land,) so, to get rid of the cold, and get free blood circulation in every part of the body restored we must remain for 30 hours or more where there will be absolutely even warmth all over the body. Nothing secures this so well as a good bed.....

FARMERS who are interested in the breeding of horses can scarcely have failed to take note of the present popular desire for a useful horse that is equally well fitted for the saddle and for harness, says the N. Y. Times. Comfort in driving is more generally desirable than rushing through the air with the dangerous speed of a locomotive, and the healthful and pleasing use of the saddle is as appropriate for women as for men.....

THIS growth of the public taste is in a legitimate direction and will consequently prove permanent. It is in accord with human nature and as near as we in America can get to the popular English recreation of hunting, which is not possible under our different land system. A jog at the rate of 10 or 12 miles an hour on an excellent country road is a pleasure that is unsurpassed by any other of the many rural delights that are to be enjoyed in "the country," and it is a good thing that the popular good sense has turned in this direction.

MULES for work and horses for profit and pleasure will be the outgrowth of the destined increase in the rearing of pleasure horses.....

THE LONDON AGRICULTURAL GAZETTE says that the women, who milk 10 cows each, night and morning, in the west of Scotland, get only 50 cents a week for their work. This is poor payment for services which include Sunday labor. They work on the land as well, and the time they spend with the cows, night and morning is not taken off the time of a day's work, for which 24 cents are paid. Still, it is not surprising to learn that increasing difficulty is experienced in obtaining women to milk the cows.

ABSTRACTS.

——ORANGE COUNTY FARMER: "During a recent drive through a farming section with a nervous horse, no less than seven ill-bred curs ran out from farmers' houses to yelp at us. Why any farmer will tolerate such a nuisance is more than we can explain."

——COLMAN'S RURAL WORLD: "What is the good of a State agricultural college anyhow? Farmers of Missouri, this question is yours."

——PROF. R. C. KEDZIE: "Shrunken and immature wheat has little value for making flour, and many persons suppose that its food value is of a low order. But young grains are richer in nitrogen compounds than the fully ripened and plump berry. The value of such grains for stock feeding is not to be measured by their flour-producing quality. These wheat screenings are worth more for stock food than the same weight of plump wheat. The value of such materials when ground and fitted for mixing with coarse materials, like straw, etc., is obvious to the intelligent stock feeder. The material should be ground to kill all seeds of weeds, as well as to secure complete digestion."

——BREEDER'S GAZETTE: "Well, sir, it has cost me just $20,000 to find out that the so-called 'nice, neat heads and horns, in beef cattle are a delusion and a snare, and I want to see your herd.' While an ugly 'spike' horn is never to be preferred to one of more desirable proportions, there is no gainsaying the fact that the hardiest and most vigorous varieties of cattle are anything but feminine as regards conformation about the head. The often-admired 'dish-face' in connection with the 'heifer-horn' almost invariably denotes a bull badly deficient in vital power."

——LONDON AGRICULTURAL GAZETTE: "Putting on one side considerations in respect of our native wheat crop now standing on the ground, the absorbing interest of the trade, so far as wheat is concerned, appears to be centered in the promise of unusual abundance in the United States and the damaged outlook from drought in parts of Russia. Supposing results should prove in accordance with present indications in both countries, what then? Well, America can afford to hold a big crop on speculation, and Russia is supposed to have still on hand the greater part of her enormous growth in 1888; the one country may sell or she may not, but the other is sure to sell all she can possibly ship, whatever our times prices may be. Consequently, a big crop in America would not necessarily involve lower rates for export; and, on the other hand, a crop failure in Russia—or in a big portion of it—would not necessarily make wheat cheaper at her ports for more than another year, so that these conflicting elements are pretty evenly balanced."

——HON. H. C. ADAMS: "It is of no direct benefit to me that you should believe a word I say, as to how cheaply I can make cream with a Jersey cow by soiling her, or how cheaply I can grow strawberries per bushel Simply as a selfish individual, I might hope you would not believe a word I say—my market would be more sure than to have you as competitors."

——N. Y. HERALD: "It is with farming as with all else. It is better not to bite off more than you can chew."

Horsford's Acid Phosphate

Makes Delicious Lemonade.

A tea-spoonful added to a glass of hot or cold water, and sweetened to the taste, will be found refreshing and invigorating.—*Adv.*

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lame-back, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

BERCHAM'S PILLS cure bilious and nervous ills.

EMPIRE POWER and SEPARATOR
BEST, CHEAPEST and MOST IMPROVED in the market.

We also manufacture Field Rollers, Plows, Feed Cutter and Crusher Hand & Power Corn Shellers, etc. Send for Illustrated Catalogue & Price List. S. S. HESSINGER & SON, Tatamy, Northampton Co. Pa.

SORGHUM EVAPORATOR

For MAPLE, SORGHUM, CIDER, and Fruit Jellies. Has a corrugated pan over firebox, doubling boiling capacity; small interchangeable syrup pans (connected by siphons), easily handled for cleansing and storing; and a perfect automatic regulator. The Champion is as great an improvement over the Cook pan as the latter was over the old iron kettle hung on a fence rail. Catalogues Free. Mention this paper.

SATURDAY, JULY 20, 1889.

SPECIAL NOTICE.

IN reply to inquiries we may state that the lower portion of the flowers of the potato R. N.-Y. No. 2 is purple. This purplish color covers about *half* the corolla. The outer portion is nearly white. This variety *never bears white* flowers. The stems also are, here and there, *tinted* with purple. They are long-jointed and do not branch as freely as most other varieties

THAT it will not pay to bag grape flowers or buds is the conclusion the R. N.-Y. arrives at from the trials made this season. Most of the bud or flower racemes so bagged failed to set fruit.

IN its account of the system of farming employed near Cranbury, New Jersey, the R. N.-Y. gave the number of head of stock kept by the different farmers. By way of comparison, we would like to have farmers in other parts of the country tell us how many head of stock they keep. Tell us the number of acres and then the number of cattle, horses and sheep. This will make a very interesting comparison.

Two more of the R. N.-Y.'s hybrids between the raspberry and blackberry are bearing fruit. One plant shows in the leaves and stems a resemblance to both parents. The berries, which consist of from one to five or six drupelets resembling those of the blackberry, have yet a decided raspberry flavor. There is not a perfect berry on the plant The other hybrid has large, peculiar foliage different from that of any other raspberry, yet of the raspberry type. It bears yellow fruit about the size of Golden Queen, and of good quality.

THE Umbrella Pine (Sciadopitys verticillata) is bound to become a most popular evergreen tree wherever it will succeed. Why? Because it is exceedingly hardy, exceedingly distinct. It is just as different from other hardy conifers as is the Common Hemlock from the Norway Spruce. It is a slow grower in early life, but each succeeding year the growth increases. Our only specimen is now about 10 years old from the nursery. It is but four feet high, and when we say that it has grown this season 11 inches, its slow growth of preceding years will be understood.

YESTERDAY was a bad day for trusts on the Stock Exchange of this city. Speculators had been investing in trust certificates without knowledge as to the number of such certificates that had been issued. Of course, the value of the securities depended largely on the number on the market. On Thursday five of the trusts are reported to have made a statement on the matter, and though the shadow of doubt has been cast on the truth of this, the vastness of the capitalization given, so frightened investors that there was a stampede to sell out, prices tumbled, and the end is not yet.

WHY not sell live poultry now? When the hens begin to stop laying is the time to get rid of them. Live poultry will bring more money now than at Thanksgiving or Christmas. Consult any year's market record and see if this is not so. The R. N.-Y. believes that 60 per cent. of the people who send live poultry to this market lose the price of the feed given after August. The same thing occurs every year. There is always a glut at the holidays, always dissatisfaction, always loss. Send the poultry now. After they stop laying they will be loafers anyway. Who wants to support loafers?

QUESTIONS involving the rights of railroads and the rights of the public are being discussed with interest just now. Have the railroads any business to encourage law-breaking and ruffianism? The recent brutal prize-fight was rendered possible by the action of the management of the Queen and Crescent Railroad. In the face of the proclamation of the Governor of Mississippi, the fighters and the thugs that followed them were carried into Mississippi and out again, every effort being made by the railroad employés to dodge the authorities and prevent arrests. The R. N.-Y. wants to know why such action does not constitute a punishable offence.

The R. N.-Y. learns of a "Lamb Club" formed by a party of Tennessee sheep men for the purpose of breeding and selling spring lambs to the best advantage. The lambs are sent to the New York market, great pains being taken to secure the best possible specimens as well as to ship them in good condition. By combining and concentrating their business, the members of the club are enabled to secure lowest rates of transportation and to present lambs of uniform grade. Thus far, as we are informed, this club has been quite successful. We know of manufacturers of maple sugar, honey and butter who have done business on much the same principle and in every case with success. There is a lesson here for other neighborly communities.

SHOULD the White Lead Trust succeed in its endeavors to buy or force out all the manufacturers of white lead in the country, paint will be effectually cornered by trusts; for the production of linseed oil has been controlled by one for two years. Marvelous is the precision with which these monopolies pounce upon articles of prime necessity as subjects for extortion and plunder. There's a growing belief that ere long the people, in sheer self-defense, will throw open our markets to the world's competition in products controlled by trusts. The duty on white lead averages 40 per cent.; that on linseed oil, 55 per cent. How unsatiable must be the greed of the combination that seeks to levy an exorbitant tribute from all who use paint, seeing that it is not satisfied with such a margin as that beyond the cost of production and a reasonable profit to outsiders!

THE R. N.-Y. learns of a difference between a Grange in New York State and the Director of the Geneva Experiment Station. One of the conditions to be observed in sending samples of fertilizers to the station for analysis is that the package must be labeled plainly with a copy of the printing upon the bag; that is, a copy of the manufacturer's claimed analysis must be sent. As we understand the matter, the Master of the Grange wanted the station to analyze a sample of fertilizer, but refused to send a copy of the claimed analysis. He proposed to deposit it with a Justice of the Peace and send it to the station after the station's analysis had been rendered. Dr. Collier refused to make the analysis, unless the Grange would comply with the regular conditions. We are not told why the Grange would not forward the claimed analysis. We would like to know why not.

THE R. N.-Y. experimented last fall with buying live pullets in the New York market to serve as winter layers. The purchase was based upon the theory that chickens can be reared in Central New York, shipped to this city and sold at a slight profit for less than it costs in our neighborhood to rear them. This is probably true. We bought some pullets for 35 cents each, that we could hardly have raised for less than 45 cents. The risk came in the impossibility of determining anything about the laying qualities of the pullets. Several of those we bought died soon after bringing them home; one proved the best layer in the yard, while at least half of them did not begin to pay for their keeping. On the whole, the experiment did not pay. This year we put our best layers in a pen by themselves with a fine Dorking rooster, and used the eggs from this pen for setting. We believe this will give far better satisfaction.

THE trade in dressed beef is driving beef cattle away from Eastern farms. What are farmers to do for live stock? Many of them are increasing the size of their dairy herds, but this increase will not go beyond a certain limit. Already we find farmers who prophesy that within five years the dairy business will be entirely overdone. The R. N.-Y. does not believe that good butter will ever go begging for a market. The poorer grades will undoubtedly have to do so. But what we want to say is that many farmers are afraid of dairying and want some sort of live stock besides dairy cows. And the latest plan is to revive horse breeding at the East. In many localities near our large cities, horse raising is almost a lost art. One must travel miles before finding a good stallion. There is a good demand for well-bred coachers and roadsters, particularly for matched pairs. Will such stock take the place of cattle on Eastern farms? We would like to have our readers tell us what they think about it.

Two weeks ago, page 445, the R. N.-Y. called attention to a new method for estimating fat in milk, devised by Mr. Parsons of the New Hampshire Experiment Station. In this notice it was stated that the method depended on a table of figures and also that it was quite similar to the method devised by Prof. Short. On a careful examination, the R. N.-Y. finds that these statements are hardly fair. The table of figures was printed simply for convenience. A formula such as is used in the Short's method, could be used if desired. The method is quite distinct from Short's and appears to have the merit of making a more complete separation, of the butter fat. In fact, the method seems well adapted to the use of creameries or large dairies. Mr. T. A. Hazen, manager of a Vermont creamery, writes us that he has used the method in two testings of the milk furnished by the patrons of his creamery, and is well pleased with it, as it gives better results than either the lactocrite or the oil-test churn, both of which were previously used.

The Canadian Government, through its savings banks, is paying four per cent. interest on deposits. Indeed, owing to the expenses incurred by advertising the business and paying commissions to postmasters, the rate, it is estimated, averages, 4.1 per cent. The Government began to pay this rate at a time when other banks were paying as high as five per cent. Since that time the rate of interest all over the world has moved down; but the Dominion savings banks have failed to respond to the movement. Thus the government banks have become competitors with other banks, and the natural effect has been to keep the interest rates above the natural level. The depositors in the savings banks are gainers by this condition of affairs; but the debtors of the Dominion and those who want to borrow money are losers, as they have to pay a higher rate of interest on loans. Farmers are, for the most part, among the latter class, and the policy of the Government in this line is therefore against their interests. The chief attraction which should be offered by the government savings system should be the government guarantee of the security of the deposits, and in no case should the rate of interest on them be higher than that paid by private institutions.

TARIFF THOUGHTS.

SOME of the figures relating to the trade in tropical fruits are worth repeating here. In 1880 we imported fruits as follows:

Dutiable.	$15,106,551
Free of Duty	5,774,847
Total	$20,881,398

The total value of the orchard products of this country for 1880 was $50,876,154. Of course, the value of these products for 1888 or for 1889 is greater than that of 1880, still it seems evident that we depend too much upon other countries for our fruit supply. The development of Florida orange groves will doubtless result in cutting down our orange bill, and California certainly ought to be able to supply us with more of our raisins.

The discussion of "A Tariff on Bananas" which we give in this issue, strikes the R. N.-Y. as being very fair. The men who discuss the matter are vitally interested, as most of them depend upon the sale of fruits for a good share of their living. The R. N.-Y. would like to give figures showing the quantities of strawberries produced, and the prices paid for them during the years when the tariff on bananas was in force. Such figures are not obtainable. The pith of the matter seems to be that the American people like bananas. Even those who grow their own small fruits, buy and eat the foreign fruit. We cannot supply the trade on our own soil. When bananas are plentiful and cheap the public naturally demands a low price for other fruits. What then are we to do?

HEMP.

LAST year raw foreign hemp to the value of $1,791,941, was imported into this country, against $847,449 worth in 1887. In addition to this, $73,362 worth of hemp tow was imported, against $119,125 worth during the previous year. The duty on raw hemp is $25 per ton; that on hemp tow, $10 per ton. Hemp yarn or twine to the value of $77,990 was imported, against $62,316 worth the previous year. The duty on this is 35 per cent. There was also imported several million dollars' worth of manufactured fabrics consisting wholly or partly of hemp.

In 1879, the year included in the last census, only 5,025 tons of hemp were produced in the United States, against 12,746 tons in 1869. Of the total, 4,583 tons were produced in Kentucky, 209 in Missouri, 78 in Michigan, 72 in Kansas, 20 in Minnesota and two in North Carolina. Lately the growing of Kentucky hemp has been attempted by about 30 farmers in Rensselaer and Washington Counties, New York, where the plants grow to a hight of six to eight feet. The producers say the crop brings in $50 an acre and that the success of the experiment will probably make hemp a staple product of that section. Why is it not grown more extensively in this country? Surely with the protection afforded by the tariff, all we need of the raw material at any rate, ought to be produced at home. Twenty years ago Ohio and Indiana ranked next to Kentucky as hemp-producers, while in 1879 not a pound was raised in either. If hemp raising were tried in many other sections of the country, it would doubtless be found that the crop would thrive as profitably as it appears to do in Central New York.

BREVITIES.

THE R. N. Y. has just planted an acre of fodder corn on oats sod.

DAIRYMEN seem to be settling upon corn silage and clover hay as an excellent bulk ration for dairy cows.

THE HILBORN, as to size and quality of the berry, is the best blackcap at present on trial at the Rural Grounds.

THE R. N.-Y. has a fine field of fodder corn—Thoroughbred Flint. This variety has remarkable suckering qualities and will evidently make magnificent fodder.

WOULD you rid your lawn of plantain? Wait until after a *heavy* rain. Then gather all the leaves of the plantain, taking a hold as near the "crown" as possible. Pull steadily and, in nine cases out of 10, the roots will come up entire. The R. N.-Y. speaks from experience.

MR. F. D. DOUGLAS, president of the Vermont Dairymen's Association and one of the best dairymen in the country, is to write us a series of articles on dairying. Mr. Douglas writes: "I am much pleased with the R. N.-Y. and prefer to write for it rather than for any other agricultural paper."

THE advantages of working a hill farm are most evident in such a season as this has been. Corn on the low lands of the N. J. Farm is poor and sickly owing to too much wet. On the uplands where the soil is warm and dry, the stand is excellent. Give us a dry season and the conditions would be almost reversed. It is hard work to climb the hill, but a sight of this year's crop fully repays one for the journey.

PRIOR to this season the R. N.-Y. has never met with much success in raising Tea Roses out-of-doors, for the reason that they were never properly treated. This year a round bed, 25 feet in diameter, was well enriched with old horse and hen manure, deeply spaded and leveled. In this about 100 Teas, for the most part yellows, were planted, strong, pot-plants having been ordered from the Storrs, Harrison Company, Ellwanger & Barry, Robert Scott & Son, J. N. May, and Peter Henderson, and transplanted about the 20th of May. Well-rooted, stocky plants of this kind soon adapt themselves to the change and in such rich, mellow soil will soon begin to bloom. If little, cheap plants are ordered by mail, they do not begin growth until midsummer and then flowers are few and small. During very dry weather, the bed must be drenched with water occasionally if we would have large, perfect buds and flowers. Insects are readily held in check if the plants are kept in a vigorous growing condition. A little hellebore and pyrethrum water sprayed upon them from time to time is all that is required. Among the roses blooming at this time freely, the following (yellow or nearly so) may be mentioned as the most charming: Perle, Comtesse de Frigneuse, Mad. Jos. Godier (China), Marie Van Houtte, Mme. Welche, Namenlose Schone, Isabella Sprunt, Caroline Custer and Sunset. But if, at this time we were to choose but one, it would be Perle.

Educational.

THE AGRICULTURAL COLLEGES.

PROFESSOR PORTER'S REPLY.

I OUGHT to feel flattered by the abundant attention which has been given to my article published a few weeks since and, doubtless in common with other readers of the RURAL, I have been much interested in the communications of the eminent gentlemen who are connected with the agricultural colleges.

Director Thorne, of the Ohio Agricultural College, believes that the intellectual progress of the age should not stop at the gates of agriculture. I agree with the sentiment fully. Indeed I go further, and believe not only in intellect for agriculture, but more especially in intellect for agriculturists, since the latter implies the former and much more besides. It is true that colleges do not make lawyers and doctors, but there is more need of "bringing together student and teacher and illustrative material" in a college class-room in the case of these than in the case of young men who desire to become farmers. To suppose that there is not, would be a "fallacy." It may be a fallacy to suppose that a college can do much to make a farmer anyway. When the graduates of the agricultural colleges are seen to beat other farmers in the same field and under the same circumstances, and to do this uniformly and unmistakably, there will be no need to vindicate or defend these colleges. But when, instead, some of the graduates withdraw from the field altogether, and others fail to distinguish themselves in a manner commensurate with the advantages they are supposed to have enjoyed, then, surely, some explanation is in order. Director Thorne admits that the agricultural colleges, with some exceptions, "have most lamentably failed to do their legitimate work." I did not think of making so sweeping and serious an accusation as this. But perhaps here my lack of experience is at fault; for I must admit that I have never made an actual investigation into the practical working of these colleges I have simply examined the reports of managers and the courses of study as published in the catalogues, to get what they were *trying* to do; and giving them the credit of success thus far, I have made my criticisms entirely on *a priori* grounds, not being able to see that it would amount to much in the direction of practical agriculture if they succeeded in doing all they were attempting to do.

Director Thorne seems to think the managers of the agricultural colleges are men of too much general culture and teach too much besides farming and connected sciences. He would get the colleges out of what he terms "the ruts of scholasticism," believing that farmers and farmers' sons are not to be caught by the chaff of classical learning. He here raises the old question between different courses of study, upon the discussion of which it is not necessary to enter here. But his position seems to involve the possible "fallacy" of supposing that you can teach or learn in a college much that has a direct bearing on practical agriculture which you cannot learn better and more easily in another way. This fallacy will not become a "folly" unless it is persisted in against reason and experience.

Dr. Beal, of the Michigan Agricultural College, says the leading thought of our best agricultural teachers is to make better and broader men while also training them for the farm; and he finely remarks that the man is more important than the farm, and that we cannot count a man as a successful farmer unless he is a success as a man, with all of which I heartily agree. In fact, I find myself at difference with Dr. Beal only on two points: first, on the question whether the agricultural colleges, as at present conducted, have a tendency to take boys away from the farm, and then in reference to the proposed winter education of farmers' boys. Now, without having any statistics at hand from which to form an estimate, and judging simply from my own observation, I am decidedly of the opinion that more than one-quarter, or even than one-half of the young men who study law become lawyers, and I might say the same of those who study medicine or engineering.

In reference to the second point of difference, Dr Beal apparently mistakes my proposition, perhaps owing to a slight, but unfortunate typographical error. I would not turn the agricultural colleges into academies, but would have them colleges still, and keep them at least up to their present grade. I would have a *college course* of winter terms, with the studies of each year rising above those of the previous year in regular order, so that at the end, the student would have finished a four years' course of study. I would do this because of the great economy both of time and money it would render possible. Dr. Beal is doubtless aware that less than 200 days of study are included in the usual college year, about 120 days besides Sundays being devoted to holidays and vacations. A winter term could be arranged so as to give 140 days of study, or about three-fourths of the present college year, leaving the summer entire for work on the farm.

I cannot think that I have made the mistake in estimating the expense of such a course of study which Dr. Beal supposes. Any capable young man brought up on the farm, can earn an average of $20 a month for six months. There are $120 for his labor during the summer. Board in the college need not cost more than three to five dollars a week, that is, $75 to $120 for 24 weeks. Any one can see that the question of expense would not be serious in case of any capable young man who desired in this way to acquire a liberal education even if he were entirely dependent, as he generally would not be, upon his own exertions. A few could doubtless obtain situations as teachers and earn more during the winter; but probably not more than a quarter as many, as in most parts of the country there are already ten applications for every vacancy in teaching. It is also more manly to take your even chance where there is room for all. Besides, the man who studies in summer and teaches in winter will never be likely to do much on the farm.

It will be observed that nothing is here determined with regard to courses of study. It is simply a question of practicable methods. If it is thought that the student will become more of a man by studying agricultural chemistry and bovine anatomy than by taking the usual course of mathematics, languages and natural sciences, there is nothing in the plan proposed to prevent his doing so. We only ask that intelligent farmers' sons in average circumstances, not simply the wealthy, be given a chance to take some course of study in the colleges and universities endowed for their benefit—a privilege from which they are at present precluded because the arrangement of college terms is not adapted to their opportunities and necessities.

Professor Budd of the Iowa Agricultural College, will see that here is abundant provision for preliminary courses of study which shall equal those of the German gymnasium for those who shall afterwards desire to pursue special courses in agricultural chemistry or veterinary medicine; for the plan is as available for preparatory and post-graduate courses as for a regular college course. The intelligent farmers' sons of America will study and keep studying long enough to attain any desirable end, if they can be allowed to do so without interrupting their productive industry, and so that the expense of college study will not be absolutely prohibitive, as in most cases it is at present. Among the many experiments to solve the problem of education for farmers' boys as mentioned by Dr. Beal, the one here proposed has never found a place. With better natural facilities for liberal culture than any other of the industrial classes, they are still left behind all the rest.

If Dr. Beal's experience shows that young men drift into the agricultural colleges for the same reasons that they drift into other colleges, then the indication would seem to be that education, not agricultural education especially, but general education, is what they are drifting after. To the same intent is Mr. Collingwood's testimony that "a vast majority of his college mates came to the agricultural colleges because they found they could partly pay their way by work on the college farm." If this is the case, how many more would go to the winter college with its more liberal course of study, and the opportunity to wholly pay their expenses by work on other farms. The work of a young man cannot generally be as remunerative on the college farm as on his father's farm, and the opportunity for work at the college is necessarily limited. Let the boys work in summer when their labor can pay and does pay, and when there is opportunity for all, and then with the proceeds let them attend college in the winter when there is little to be done on the farm, and when half of them can be spared as well as not.

Now, suppose that a young man wants to become a competent agriculturist in any of the branches of agriculture; suppose, for example, that he wants to learn market gardening, a branch which has no proper illustration on his father's farm; what shall we do with him? Shall we send him to an agricultural college to study botany and bovine anatomy and kindred sciences for three or four years? or shall we send him for a part of one year to a farm school where he can see the whole thing illustrated, and learn it all by assisting in doing it? If he be a bright young man he will learn the whole business in a single season. It will cost him nothing but his time, for his work will pay his expenses, and he will know how to do the same thing on his father's farm, or his own the next year. He will also learn much about other branches of agriculture, for they will be carried on at the school, and he will have abundant opportunity to observe and make notes of the various operations and methods; and "one lecture a day by the professor" will explain the reasons and principles of all that is done.

I cannot understand Mr. Collingwood's remark that not a corporal's guard of capable young men would attend such a school. The farmers' sons of the Northern States are intelligent, resolute, self-reliant, and capable of earnest work. They are not snobs and dudes, and have given no occasion for such an estimate of them. Perhaps Mr. Collingwood is laboring under some misapprehension with reference to what is proposed. At least his own testimony, as cited above, seems to contradict his opinion.

Since the above was written I have read President Chamberlain's interesting papers, and will notice briefly some of the points which he makes. I do not clearly perceive the distinction he draws between the "college idea" and the "agricultural college idea." A college, as I understand it, is a place where young men go to study for the purpose of general culture or to acquire professional or technical knowledge. Agriculture is learned not so much by the study of books as in other ways. We want the farm school, the experiment station and the agricultural newspaper for that. The three-term or the all-year college, whether agricultural or not, so far as I can judge, takes young men away from the farm. It makes them ministers, lawyers, doctors, teachers, engineers, veterinarians, and professors of chemistry, botany, entomology, etc. So far it is all right. We do not want to keep all the boys on the farm. In our past history, the farm has furnished many of our ablest professional men, legislators and statesmen, and it ought to furnish a no less proportion in the future. There is no place like the farm to give a boy a good "send-off" towards capable manhood, whatever occupation or profession he may choose to pursue.

Now, we want all of these professional men that there is room for, but we do not want any more; and an agricultural college would be doing a very small business if it only furnished veterinarians for its own State and professors for the experiment station of the State. Whether these few professionals are to get ther education in a so-called agricultural college or in a university proper, is not a very serious question. But the question where the hundreds of thousands who are to stay upon the farm are to get their education, and especially the question whether they are to have any chance for liberal culture or not, is very serious. This problem the agricultural colleges and State universities have not helped us to solve so much as they might and ought.

Those who are to stay upon the farm should have the opportunity of education in such form as not to interrupt the continuity of their industrial home life, or slacken their interest in it, or cut off the means of support derived from it. I believe there is nothing which so well answers all the conditions of the problem as the winter college to alternate with the summer farm school. Therefore I say, turn the agricultural colleges into schools of general culture where the sons of farmers can pursue any desirable course of study during the leisure months of winter with great economy of time and at very small expense.

I confess I was not aware of the iniquity lurking in this proposal as involving an unfaithful dispensation of trust funds until President Chamberlain pointed it out. But I should doubtless, at the present moment, be overwhelmed with confusion and mortification in view of it, had not a thought occurred to me which has afforded me considerable relief. Fortunately the testator in this case is not dead, but is still of sound and disposing mind and memory, fully competent to change the conditions of the trust. And doubtless upon the representation of any State that the great purpose of the grant, namely, "the liberal and practical education of the industrial classes" would be best promoted by a larger liberty in the dispensation of the funds, permission to make any desirable change could be easily secured from the national government.

But let us consider for a moment what is meant by the language of the grant as it now stands. Among the "branches of learning related to agriculture" which it must be "the leading object to teach," may be mentioned chemistry, botany and veterinary medicine. The relation of these and of most other "*branches of learning*" to practical agriculture is very remote; and to suppose that any farmer or any farmer's son could afford to spend three or four years' time and some hundreds of dollars in money to learn them merely because of their practical relation to his business, would be nothing less than a "fallacy." But it seems to me that the terms of the grant would be liberally fulfilled if the college develops these sciences in their relation to agriculture so far as they have such a relation, and holds itself ready to teach them so far as such instruction is called for. In this way we should get our veterinarians and professors of agricultural chemistry, botany, etc., and for my own part I do not see why these sciences may not be developed and taught in connection with a large and well equipped university as well as in a special and separate college. But in either case the great object of the grant "the liberal and practical education of the industrial classes" will remain unfulfilled.

President Chamberlain adds his emphatic testimony to that of the other gentlemen to the effect that the young men who go to the agricultural colleges of the West, go for general culture, and in many instances will not take the so-called agricultural studies at all unless they are compelled to do so. And in this connection I may as well admit that, as suggested by President Chamberlain, I had a very inadequate conception of the difficulties under which some of the agricultural colleges are laboring. If he and his coadjutors are trying to teach stock-raising, bovine anatomy and agricultural chemistry to classes who are unwilling to learn them, they are surely undertaking a very difficult task indeed. And if they feel impelled to this attempt through a sense of obligation to a literal fulfillment of the terms of the land grant, I think they would do well to apply to the State legislature and Congress for relief.

The testimony which President Chamberlain gives as to the strong feeling of farmers and their sons in favor of liberal culture, does not seem to me to warrant the confidence with which he predicts that the old and tried courses of study will fall from the position they have so long and honorably held.

At the close of his first paper President Chamberlain proposes to me a dilemma in the form of a syllogism. I beg leave to amend the syllogism. I would state it as follows:

All occupations, whether industrial or professional, are equally dependent upon such knowledge as can best be acquired in a college class-room, or in the lecture hall of a university.

Agriculture is an industrial occupation.

Therefore, it is as important to send a boy to college to learn farming, as it would be to send his brother to college to learn law, or medicine, or theology.

I most emphatically deny the major premise. From what President Chamberlain says in his last paper of the equal importance of a knowledge of underlying principles in agriculture, and in law, medicine and divinity, I should almost expect he would affirm it. At any rate the syllogism in its present form will serve to illustrate the difference in our respective positions.

President Chamberlain's objections to the methods I have proposed do not seem to require an extended reply. It will be seen that in the plan of a summer farm school for "practical education" to alternate with the winter college for "liberal education," there would be abundant opportunity to teach botany and entomology so far as they have any relation to practical agriculture, with the use of insecticides, spraying trees, etc.

President Chamberlain objects to paying the young men for their work. I think that every State in the Union, every Northern State at least, is abundantly able to carry on a farm school at which every branch of agriculture would be properly illustrated. If the young men simply look on they should of course not be paid. But if they take the places of the workmen five hours a day, as proposed, thereby saving so much to the State, I see no reason why they should not be paid as other men would be for performing the same labor. They would earn better by assisting regularly at the work, and would acquire that deftness of hand which President Chamberlain complains that they lack; and the product of the farm should pay for the labor performed upon it, whether by students or others.

So notwithstanding the arguments and objections so ably stated by the distinguished gentlemen who have done me the honor to notice my previous article, I still think we ought to give our farmers' boys the winter college for the opportunity of general culture, the "liberal education" of the grant, and the summer farm school for instruction in practical agriculture, adapting the two institutions, or the two parts of the same institutions to each other as best we may.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

WHIPPED CREAM is one of our favorite summer sauces; we eat it with all sorts of fruit and fruit puddings. It is very easily whipped, so as to be quite stiff, and may then be flavored. If the cream is either too poor or too rich it cannot be whipped properly; in the former case it will not stiffen, and in the latter it turns to butter. We whip ours up with a Dover egg-beater.

* * *

WHIPPED or clotted cream with bread and honey is a dainty approved by many old country people. Thunder and lightning is the old Cornish name for this dainty. Clotted cream is a Devonshire dish, made by standing the vessel of milk on the stove, after the cream is risen, and letting it scald, without coming to a boil. When the cream begins to wrinkle the pan is removed; when cold the cream is skimmed off, making thick clots. It is advisable to stand the pan in another, containing water; otherwise it is liable to burn, and this flavors the cream.

SENSIBLE TROUSSEAUX.

EVERY GIRL who expects to become a bride—and we all expect it, with more or less certainty—feels an interest in the preparations for that important change, and yet it is a matter concerning which we can get little definite information. Even the simplest trousseaux we see described often exceed the allowances of many girls; for example, a recent article on this subject gave the disposal of $210; this sum was chiefly laid out in outside clothes, the underwear being excessively meager, while there was no allowance whatever for household linen. The sum quoted would seem pitiful indeed to Miss Flora Mac Flimsey, but plenty of girls accustomed to both comfort and refinement are compelled to content themselves with a similar amount. The outfit is not shabby, either, but they must give the "must-haves" preference over the "may-wants." The possession of a certain stock of household linen is imperative—very often the lack of this causes the prospective bride to decide upon boarding, a very unsatisfactory substitute for home life, save in exceptional cases.

To begin at the beginning: a girl without means of her own—that is to say, one who has no marriage portion, who marries a young man on a moderate salary—has no right to wear an elaborate wedding gown, with veil and accompaniments. It is out of keeping with her circumstances, although many girls forget this. If the wedding takes place in the summer she may wear a pretty white muslin gown, and the quaint Directoire modes are very bride-like in this simple material, but in the winter, when a white gown means either silk or wool with expensive trimming, it cannot be recommended for an economical trousseau. Simplicity is best, and more befitting to the sacramental rite which is so often turned into a purely secular festivity. A morning wedding obviates this apparent necessity for a white gown, and the bride may then wear her best cloth, which will be called a traveling gown.

If our moderately circumstanced bride can afford two good cloth dresses and one silk, she may surely get along with what she already has in her wardrobe. She should try to have a dozen of all-muslin under-garments; if she has more they will only become yellow in her drawers, and she should have half a dozen each of summer and winter flannels. Three flannel petticoats, two heavy and one light, one flannel dressing sacque, and one of muslin. Coverings for hands and feet must not be forgotten, and get all these things before investing in tea gowns and all such. For the same moderate trousseau get one dozen sheets, one dozen pillow-slips, six table-cloths, two dozen napkins, two dozen chamber towels, two dozen kitchen towels, two bed-spreads (Marseilles) two pairs of blankets, and as many quilts and comfortables as money or industry will procure. A further article will give more details of this "setting out."

COTTAGE MAID.

WHAT TO READ IN SUMMER TIME.

OLIVE F. DANA.

WHY should we think that we can read only stories, and the lightest of them at that, in summer time? And who was the wise man who said he would fain match his book with the season and the weather? These thoughts come as I think of books for summer reading. To the first I am conscious that exceptions may be taken. Some of us do improve our mid-summer leisure with other reading than fiction. And, moreover, there seems to be no good reason why that very ample leisure should not itself be the warrant and opportunity for other books, to be perused leisurely and remembered long and pleasantly.

To the second query, too, I object, in the sense of differing on the ground there is charm and force in contrast. Yet there are some books which savor so strongly of summer fields, and suggest so unmistakably birds and bees and blooms, upland pastures and shady brooksides, that one turns instinctively to them as the bright out-door world opens its doors again. First and foremost among such books are the works of John Burroughs. I don't wonder that the "Journal of Education" has in its editorial columns a plea that teachers and others should learn to "read, know and love him." This genial editor himself notably observant and appreciative, enthusiastically says that "John Burroughs is the one American of to-day whom the schools should know and teach appreciatively and critically. He is the one man who balances science and literature, nature and human nature, fields, forest and studio." And again, "He tells us what we might have known ourselves, and we wonder why we did not see it or tell of it." This last is emphatically true. There are a great host who need no introduction to Mr. Burroughs as an author; there are doubtless many more who may thank the giver of the advice alluded to, learning the value of the books to which it would fain lead them.

And following the principle of contraries, I would recommend not only "Pepacton," "Wake Robin," "Locusts and Wild Honey," and "Signs and Seasons," with the rest of his comely and inviting volumes, but his latest also, which is of "Indoor Studies," and has therefore a more pronounced literary flavor than its predecessors. It seems to me that most readers enjoy Mr. Burroughs most when he discourses on out-door topics. Yet his vision is keen, as well as wide in its range, and the critical instinct is strong and the critical faculty exceptionally well developed in him. And these essays are full of interest, often of a near and very human sort. Especially interesting is the last, an autobiographical, which he names "an egotistical chapter."

Many will regret that this otherwise delightful volume contains that utterance of his, "An Open Door," which is in its spirit and substance so alive to the Christian faith, and wonder again at the belief or unbelief which made such a production possible, which seems, also so unlike the usual animus of Mr. Burroughs's writings. This aside, the book is, like all his works, wonderfully fresh, sane, sound, sensible, entertaining, instructive.

Another book especially fit for summer-time is "Emerson in Concord." It depicts the poet and the author as he appeared and was at home—as father and friend, neighbor and townsman, and so is full of unique interest, and is thought-provoking, as indeed every echo of Emerson's self must be. There was such a solid sub-stratum of reality about the man, and, underlying his most ideal utterances, such a permeating leaven of sense in his most poetic moods and loftiest flights, that every emanation from him is wont to be of an invigorating character. And if we sometimes dissent from his conclusions, opinions, convictions, we have been maybe led only to establish our own on surer basis. The motto at the beginning of the volume, taken from Mr. Emerson's own journal, will bear repetition: "I want to tell you something, gentlemen. Eternity is very long. Opportunity is a very little portion of it, but worth the whole of it. If God gave me my choice of the whole planet or my little farm, I should certainly take my farm."

What a boon to book-loving, impecunious people is the public library! How much comfort comes out of it, and what a large income of profit and pleasure returns from the dollar or two we spend in yearly fees! Let me hope that every RURAL reader has such a privilege and improves it.

OUTINGS IN NEW ENGLAND.

XIII.

MARY WAGER-FISHER.

OUR third summer outing in New England, was again at Marblehead Neck, but only the laddie was with me, Anaximander having gone on a business trip to the North Pacific coast. I went with a good deal of hesitation to that rock-bound place, because of the lad's fondness for rocks and water, and fear of a thousand possible accidents, not one of which happened, uselessly afflicted my worrying capacity. To go out in a dory, to swim, to forage around in the rocks for crabs, to wade out in the sea for star-fishes, to fish and fill the pockets of his knickerbockers with what he caught and forget all about them until next day, or bring them home in his hat, to build on the rocks bonfires of drift wood and roast all heard of and unheard of sea denizens, and eat them, to come in every other day soaking-wet from neck to heels, to have rows of stockings, shoes and trousers always hung up for drying, to buy a new pair of rubber-soled shoes once a week regularly for the busy little feet, formed a large part of my occupation for those six weeks of bliss—for the boy! He had all his bottles of alcohol filled with "specimens," he knew every nook and cranny of those magnificent rocks, knew when the tide would ebb and flow, and so increased his natural passion for boat building, that his den at home has long been dubbed the "Navy-yard." A party of young women from Vassar College, interested in marine studies, were often to be seen out in the water, in bathing suits, and with their trained eyes, were always finding strange and wonderful things, that others did not see. One of them had in her room a coral plant which she had secured a year previous in the water at Nantucket, and it was still alive and thriving. She kept it in a glass turreen in sea water, and fed it upon bits of shredded barnacle, and it was curious to see the tentacles open to take in the food. Its growth was accomplished by putting forth buds.

The veins of greenstone in the porphyry rocks being of a softer texture, had been so acted upon by the beating of the surf as to be worn away in some exposed places inland, to the distance of several yards. When the surf was fine the water would rush in these narrow passageways with great force, throwing the spray up to a great hight. These fissures go by various names—the "churn" being a favorite one. When the surf was fine, the great rocks would be covered with people watching the grand sight, and there is nothing monotonous in the sight of a rough sea. To paint the water in action is the despair of many artists, and I remember one young woman who declared to me one day in accents of despair: "I *cawn't* get it! I cawn't get it!" But she continued persistently to work at it, for I often saw her afterward, working away in the shade of her long-handled, white umbrella, which she planted directly on the beach.

The light-house and the light-house keeper's dog, a *true* Newfoundland as he declared, were always objects of interest, the lantern on the light-house being invariably run up at a certain hour. The dog was long in body, very short in the legs, and bore no resemblance to what commonly passes for a Newfoundland canine.

Another point of romantic interest was the Fountain Inn well, where one could get a drink of water. Agnes Surriage, a very pretty girl, was employed as a servant in the Fountain Inn in 1742, and one of the guests at the Inn, a young English Baronet named Frankland—then Collector of the port at Boston—saw her and became deeply interested in her. She was sweet 16 and barefoot; he gave her money to buy shoes and, later on, took her to Boston and educated her. She seems to have lived with him after that in an illegal way, and went with him a dozen years later to Lisbon, in Portugal, and was there at the time of the great earthquake. Frankland, who was out riding with a lady, was buried in the ruins of falling buildings. Agnes began a search for him, and hearing his voice, at once tried to rescue him. She raised stones and timbers off him with her own hands, working like a demon in his behalf, and finally liberated him. The man, then touched by her faithful devotion which had saved his life, married her and presented her to his friends in England as his wife, the Lady Agnes Frankland. So the story runs, and it has been used as the basis of a novel, called "Agnes Surriage."

Two or three times we went to Salem—the horse-car fare, a distance of 3½ miles, being but seven cents, and a charming ride through the country fields. It is now a city of 30,000 inhabitants, and a very pretty one. It has one of the most interesting museums, called the "East India," in the country. The merchantmen of Salem in olden times brought back from the East exceedingly beautiful things, including the utensils used by the Orientals in their work, and these have been brought together, with a multitude of other curios, forming a unique and extraordinary collection. Not far from this museum is the house where Hawthorne lived—a plain, brown wooden house, directly on the street. Was *ever* a gifted man or woman born in a fine house? Of course, one associates witchcraft with Salem, and we went one day to the Court-house to see the witchcraft papers, which contain full reports of the trials of the accused. The original documents are difficult to read, but very amusing because of the spelling. These papers have all been copied in a legible clerkly hand, and both copies were placed at our service. I looked over the testimony relative to two or three of the accused—especially that of Rebecca Nourse—and more senseless, worthless "testimony" it would be impossible to imagine. And yet, evidently, the various witnesses related what they believed to be the truth!

Such is the amazing power of superstition upon ignorant minds. It seems strange to-day, that there was not enough common sense, and common every-day bravery and penetration to have rescued the victims of that "strange delusion," and I felt astounded that day, more than ever before, that human beings were put to death on such paltry stuff as was offered by the witchcraft witnesses. The house in which Rebecca Nourse lived at the time of her accusation is still standing, and it is nearly 200 years since she was hanged. The frame of the house is of solid oak and the rooms are small and low-studded. Her body was brought home after the execution in the night, and on the following night it was buried in the family burial plot nearby. Four years ago her decendants erected a monument over her grave. On the front is this inscription:

REBECCA NOURSE.

YARMOUTH, ENGLAND.

1621.

SALEM, MASS.

1692.

"Oh, Christian martyr who for truth could die,
When all about thee owned the hideous lie,
The world redeemed from superstitious sway,
Is breathing freer, for thy sake, to-day."—

the lines being by Whittier. We also saw a vial in which were sealed up a dozen round-headed pins called the witches' pins, believed to have been used by the "witches" to torment their victims.

GOLDEN GRAINS.

Happy the man, and happy he alone,
He who can call to-day his own;
He who, secure within, can say,
To-morrow do thy worst, for I have lived to-day.
Be fair or foul, or rain or shine, the joys
I have possessed, in spite of fate are mine.
Not heaven itself on the past has power,
But what has been has been, and I have had my hour. *Dryden*

THE CHRISTIAN UNION says that a courteous man always predisposes people in his favor; he creates everywhere an agreeable impression; makes people willing to serve and anxious to help him. Many a man of very ordinary mental force has achieved striking success in business simply because of the kindliness of his spirit and the courtesy of his manner. Honesty and ability without courtesy lose a good deal of their effectivensss in every-day business life.....

THERE is profound truth in the words of Phillips Brooks, "the only way to flee away from God is to flee into him." The only way to escape the worst sufferings and the deepest anguish of life is to accept the will which is being worked out in us and through us, and co-operate with it.....

AGE resisted means steady growth in artificiality and frivolity; age accepted means deepening experience and widening life. Some one has said, with the deepest wisdom, that the way to get the most out of life is to accept completely each stage of it, to drink to the bottom the cup which youth and maturity and age hold to the lips, and so to take from life all that lies in its hands.....

ONE of the secrets of successful living is the steadiness of aim and the resolution of will by which one bends circumstances or events to the working out of his own purpose; the other great secret of life is hearty, intelligent, and complete submission to its conditions and to all that it brings.....

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria

THE difficult things, if they are inevitable, are the very things which the wise man sets himself to accomplish first of all; the easy things may be done at any time. Submission does not mean, as some of the old anchorites thought, the effacement of self and the surrender of all the joys of natural life; it does mean a deep faith that there is a wisdom higher than ours which has fixed the conditions of our life, and from whose hands come the events which make our history; and that our part is neither to ignore nor to struggle against that which comes to us from the Infinite Wisdom, but to work with instead of against the higher purpose. The prize scholars in the great school of life are not those who evade its lessons, but who learn them the most thoroughly.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOPE.

A GENTLEMAN once said to a little colored boy whom he met by the way:

"Sonny, how old are you?"

"Well," replied the obon youth, "'ef yer gose by wat me muffer says, I'se six yeahs ole; but 'ef yer gose by the fun I'se hed, I'se mos' a hundered."

This is the way we measure our age. The cares and sorrows which come to one add more wrinkles and gray hairs than do the years. My years to some of my readers might seem but few, but when I think of the sorrows which have fallen to my lot, I feel like the little darkey did in regard to his pleasures—almost a hundred. Some time ago while brooding over the past, eating out my very heart in bitterness, my eye fell upon the following lines which were in a paper that had come around a parcel. They seemed to set themselves into my mind and have since helped me over many a rough place. Hoping they may help some one else, I repeat them:

"Has your life a bitter sorrow?
Live it down.
Think about a bright tomorrow,
Live it down.
You will find it never pays
Just to sit, wet-eyed, and gaze
Live it down.

Has your heart some secret trouble?
Live it down.
Useless griefs will make it double.
Live it down.
Do not water it with tears—
Do not feed it with your fears—
Do not nurse it through the years—
Live it down.

Have you made some awful error?
Live it down.
Do not hide your face in terror;
Live it down.
Look the world square in the eyes;
Go ahead as one who tries
To be honored, ere he dies;
Live it down."

How easy it sounds to say "Live it down," but when one thinks of the loved ones lying cold 'neath the sod, is it so easily done? Ah, no! But our grief cannot bring them back—perhaps a loved father, a self-sacrificing mother, a tiny, sweet-faced baby the touch of whose warm little fingers seem almost yet to linger on our breast, a tender lover, or husband—tears are of no avail! We who have given up our loved ones can never forget, but if there are still those living who have a claim upon our hearts, it is unjust to them to spend all our days in weeping. Those who are with us yet, may, before many days go by, pass over beyond, and then we will remember in bitterness what we might have done while they were yet here.

No, we can never forget. In the silent night the loved faces come before our eyes; we see the same old smile, we hear the soft tones, hear the loving words repeated by the dear voices that have been hushed and stilled by death. These are our sacred hours, and then it is that we may weep if we will, but when the day dawns, bringing new duties, we must take up our tasks and do them faithfully, living in hope for the future. We must battle bravely to live down our useless grief and fretting.

"For love of the living we take up our cross,
And strive to be cheerful and brave,
When hopes fondly cherished
Have faded and perished,
And buried our heart in a grave.
For still there are duties for us to perform,
A chance for more generous giving
To those who are left,
And when death has bereft
More closely we cling to the living.

We may feel that there's nothing remains to be done,
That all need for exertion is o'er
When our hands are unclasped
From the dear one's they grasped,
For whom they can labor no more;
But He who sustains in trials like these,
New strength and fresh energy giving,
Provides a swift cure,
And our ills we endure
With patience, for love of the living.

Though deeply our hearts are attached to the dead,
And the past that is always so sweet;
Though the scenes of delight,
So sacred and bright,
Can never their beauty repeat,
Some pleasures in life we can find to enjoy
By comforts and kindnesses giving,
For 'tis true as we know,
That our love we may show
To the dead, by our care of the living."

This is the way we must look at life. When we are very young it seems as if we could not do so, but as we grow older we become more philosophical. If we all give up when Death steals into our homes and robs us of our loved ones, what will become of the world? For is there a home where he comes not? If he has not visited you yet, he will some day. You may be the first one called. Be brave and patient. Do each day what that day brings to be done, then when the messenger does call, you will have no neglected duties to leave behind. DORA HARVEY VROOMAN.

FLORENCE NIGHTINGALE wrote the following to the Band of Hope of the Mayfield Free Church of Edinburg:

"Don't think you can do anything worth doing in a fit of enthusiasm, but train yourselves carefully to any work you are called on to do; and think nothing too small to do carefully, or to train carefully for, that is for the good of your fellow-creatures. For instance, good or bad cooking may make or mar the lives of thousands, and those, too, who are trying to do great things for our race. God sends us real and lasting enthusiasm—that is, the spirit of love and of power, and of a sound mind to carry us through our training and our discipline. It is He dwelling in us. That is His goodness to us."

SOFT SOAP.

HAVING lately read considerable in the RURAL and other farm periodicals on making soft soap, I thought I would give my experience, as it has extended over 40 years of married life and in my girlhood at home we never failed to make our barrel of soap, any more than the "gude mon" failed to put in his spring crops. With one or two exceptions, I have made it in the good old-fashioned way from lye of my own leaching, and shall evermore make it in that way.

We found the same difficulty when using bought lye or potash, that your contributors complain of—that it would not keep. We used Babbitt's extract of lye and while it made nice, white soap it would not keep. In a little while it had a bad odor. Others have used potash with the same results. All the difficulty I ever found in making the old kind (if the ashes are good) is that it will come before the grease is eaten up, if put in the rough, and that necessitates taking the top off and putting the soap away, and then putting back the grease, and adding more lye. But we have obviated that difficulty by never using any grease in the rough. We never put in any more bones, but pick them clean, and then, if we wish, throw them into a low box where the hens can pick them without scattering them around the yard, and where we can gather them up, burn and pulverize for the poultry yard. We keep an old dripping-pan, or spider where it is handy to throw in our scraps of fat meat and the rinds of shoulders and hams, and when it is full enough we put it in the oven and bake until it is crisp and brown. Take out and pour off the fat for soap and break up the refuse for the hens. You will be surprised at the amount of fat that will come out of what you had supposed was already cooked clean. In the same way serve all uncooked scraps of meat or tallow. These and the scraps from lard and tallow rendering are all we use, and the latter being clean and already tried out, can be used without even boiling, if one wishes.

It is true that many farmers in the country do not make their own soap any more, even though they are always wishing they had a few gallons for house cleaning and rough work. They say: "Bar soap is so cheap, and then we do not own a large kettle." It is not a necessity to have a large one, though very convenient. If your keg or barrel for soap is good and strong, put your grease into it, and heat your lye hot and pour it on, stirring it every now and then as you add hot lye. Keep doing so until the lye seems to have eaten up the grease, and the stuff is of the right consistency.

For putting up a leach, we have a frame made three feet long, or more, and two feet wide, and a couple of inches higher at the back than at the front. On this we put a wide board for a large barrel; cut a crease in it outside of the barrel and let the sides come together within a few inches, from which place it should run into a jar or kettle (wood is not fit for that use as it will shrink and fall to pieces afterwards). Bore a few gimlet holes in the lower side of the barrel, set it on the frame and put half a dozen sticks crosswise in the bottom, and on these put a handful of hay or straw. Put a couple of quarts of lime on this, if you have it.

Now put in three or four pailfuls of ashes, pound them down, then add a pail of water, keep on doing so until the barrel is full. Let it stand and soak a couple of days, covered from rain, with a jar under it, or until you are ready to go at it in good earnest. Then keep the ashes covered with water and you will soon have lye enough for your purpose. Watch the jar to prevent the contents from running over and wasting the strongest lye. We always keep our leach standing after soap making so that if at any time we want a weak lye for cleansing purposes we very soon have it by putting on a pail of water. It is nice for hulling corn. Keep the barrel covered, and if at any time the jar gets full from it, throw the contents back into the barrel. A pound of dissolved borax adds a good deal to the bleaching and cleansing qualities of a barrel of soap. It is cheap and will take the place of all fluids and powders for making washing easy and will not in the least injure the clothes. C. R. DAVIS.

GRENADINE is again worn.

FOULARDS are very popular.

MOHAIR (Alpaca) is the goods most used for traveling dresses.

ACCORDEON plaiting is pretty and popular. It is, however, quite expensive and not very lasting.

WHILE the high standing collar is still worn, many dresses are seen cut quite low in the neck and finished with a turned-over plaiting or simple binding A wide linen and lace turned over collar is worn with the last finish.

"Enjoy thy youth, it will not stay,
Enjoy the fragrance of thy prime,
For oh! it is not always May.
Enjoy the spring of Love and Youth,
To some good angel leave the rest;
For Time will teach thee soon the truth—
There are no birds in last year's nest."

WORTH A GUINEA A BOX

For Weak Stomach—Impaired Digestion—Disordered Liver.

SOLD BY ALL DRUGGISTS.

PRICE 25 CENTS PER BOX.

Prepared only by THOS. BEECHAM, St. Helens, Lancashire, England.

B. F. ALLEN & CO., Sole Agents

FOR UNITED STATES, 365 & 367 CANAL ST., NEW YORK,

Who (if your druggist does not keep them) will mail Beecham's Pills on receipt of price—*but inquire first.* (Please mention this paper.)

News of the Week.

HOME NEWS.

SATURDAY, July 13, 1889.

EVER since "trust" certificates have been prominently put on the speculative markets, men have wondered how many certificates had been issued, and what was the amount of their capitalization. On the matter all the trusts were mute. The Stock Exchange here insisted that for the protection of investors, a statement on these points should be made by each of the trusts whose certificates have been on the market. The Exchange possessed similar information with regard to other quoted stocks, and there was no reason why the trusts shouldn't report their standing. After some hesitation, five of them did so last Tuesday. Here are the figures, the amounts of the capitalization being given at par:

NAME OF TRUST.	NUMBER CERTIFICATES.	TOTAL CAPITAL.
Lead.....	830,188	$83 018.800
Sugar.....	498 565	49 856.500
Cotton-oil.....	421,852	42,185,200
Distillers' & Cattle Feeders'.....	307,266	30,726 600
American Cattle....	133,961	13,396,100
Total.....	2,191,832	$219,183,200

As most of them are at a premium, the actual money value of the certificates is considerably more than $219,183,200. The Lead Trust is one of the newest, and less than two months ago its capital was $32.000,000. Since then the monopoly has absorbed six large companies, chiefly in Brooklyn, Philadelphia and St. Louis, and for each of these the managers have issued new certificates and increased their capital stock to a corresponding amount, but it is incredible that they were worth anything near $50.000,000. The general conviction is that at least half the amount is "water" on which the dear public will have to pay heavy money interest. The managers of this trust and those of the Standard Oil Trust, the parent and prototype of all trusts, are the same. The Standard Oil has never applied to the Stock Exchange to have its certificates dealt in, and its affairs are still secrets known only to the managers.....Lately elected Senator W. D. Washburn, of Minneapolis, the most extensive miller in the country next to C. A. Pillsbury, has finally withdrawn from the milling business. He was also largely interested in banking, lumbering, railroading and countless smaller side-issues, like the Minneapolis Stock-Yards Company, and some months ago became temporarily financially embarrassed. Friends came to his aid and he has tided over his troubles with a competency of $500,000, and henceforth will give all his attention to his Senatorial duties..... The Republican New York Legislature, at its last session, passed a demagogic, vote-alluring bill making $2 a day the lowest wages for men working for the State, and Democratic Governor Hill signed it. Correspondingly large appropriations were not made, however, and 500 out of 1,200 hands employed on the canals and large numbers employed in other State works have been discharged, and more will be, because there will be no money to pay them. Much grumbling at the deceptive political boon..... The will of the late Arunah L. Abell editor and proprietor of the Baltimore Sun, gives sums ranging from $300 to $1,000 each to the compositors, reporters and editors of the paper. Peace, oh, peace to his ashes!..... A large cave whose walls are lined with veins of solid silver is reported to have been lately discovered near Hermosa, N. M. "King Solomon's Mines" are nowhere in comparison.....A very fatal type of diphtheria throughout Massachusetts is greatly alarming parents and others..... The capture of the books of the Clan-na-gael has led to the disclosure that 25 members of the notorious camp 20, that tried and condemned Dr. Cronin are on the Chicago police force. Small wonder little progress has been made in discovering the criminals!..... ....Excluding the Pacific railroad bonds of $64,623,512, the interest-bearing debt of the United States is now reduced to less than $830.000,000, with a total annual interest charge of about $41.000,000. On August 31, 1865, the interest-bearing debt stood at the enormous total of $2,381,530,294, with an annual interest charge of over $150,900,000. What a wondrous falling off is there, my countrymen!..... Ex-Beauty Langtry is pretty badly ailing at Long Branch.....Gen. Sherman's eldest son was ordained a Catholic priest by Bishop Ryan of Philadelphia, a week ago.....The compilers of the the New York Directory estimate the population of the city at 1,755,500, on a basis of five to each family, and suppose that 400,000 more who have business in this city but live in Brooklyn, New Jersey, etc., go in and out daily .....The Farmers' Alliance and the various trade-unions of Alabama, which held a demonstration at Birmingham on the Fourth, excluded the colored men. ....There is an organized movement to induce the negroes of the South to emigrate to Oklahoma, where 100,000 are expected by next July. Oh, yes; there'll be a trifle more than standing room for them!..... The Persian Minister at Washington, Hadji Hassein Ghooly Khan, can't see any fun in the jokes attempted by the American press on himself and his august master, the Shah, and is about to leave the country in disgust and anger, amid a paragraphers' chorus of: "Oh, pshaw, Ghooly!" ..... Mr. David Kimball Pearsons, one of the busiest men of Chicago, 69 years old, has given $100,000 to Lake Forest University; $50,000 to Knox; $50,000 to Chicago Theological Seminary; $50,000 to the Presbyterian Seminary; $60,000 to the Presbyterian Hospital; $30,000 to the Young Men's Christian Association, and $20,000 to the Women's Board of Foreign Missions, besides $250.000 in various other ways and in smaller sums. The liberality of such men should be blazoned abroad both as an honor to their generosity and a reproach to the niggardliness of most other rich men..... Tuesday Mr. J. B. Haggin's horse Salvator, won the Lorillard stakes for three-year-olds, at Monmouth Park, near this city: course, 1½ mile; time, 2.37½; value of stakes, $23 450. Salvator is considered king of the three-year-olds, having won, in three weeks, besides the Lorillard stake, the Realization worth $33, 375, and the Tidal worth $7,000, at Sheepshead Bay—a total of $63,825 for his ten-times millionaire owner. "To him that hath shall be given." Haggin's satisfaction must be checked by grave charges made by four of his most prominent competitors of foul play during the race.....The late Simon Cameron's estate is valued at $1,700,000, nearly all of which has been divided among his family..... The President has appointed Horace A. Taylor of Minnesota, Commissioner of Railroads, and Prof. Thomas C. Mendenhall, of Indiana, Superintendent of the Coast Survey—two good appointments..... Shortly after the law was passed providing for a private secretary for each United States Senator at the public cost, Senator Reagan, of Texas, appointed his wife his private secretary. The practice is spreading. T. J. Morgan, the new Commissioner of Indian Affairs, has just appointed his wife his private secretary at a salary of $1 000 a year, and Dr. Dorchester, Superintendent of Indian Schools, has got his wife appointed special Indian agent at $6 per day and expenses A considerable number of Senators and other public officials have their sons and daughters in offices connected with their business; but the wife is now coming to the front as an office getter. Of course, there are loud charges of nepotism; but equally, of course, they all come from the "outs," who jeeringly exclaim: "A public office is a private snap" or "a family perquisite."..... ... Mrs. Charles Kendall Adams, wife of the President of Cornell University, died at Ithaca, N. Y., the other day..... John Norquay, ex-Premier of Manitoba, a Scotch-Indian half-breed, died at Winnipeg a week ago..... After all, it appears that the four new stars which Secretary Tracy ordered to be added to the 38 old ones on Old Glory, should not have been placed there before the Glorious Fourth next year. None of the four Territories has yet become a State, as none has formed a constitution or done any of the several other things prerequisite to admission, and a star is to be added only on the first Fourth of July after the admission of a State. The Treasury Department takes the above view of the matter. The nation at large, however, appears to side with the Navy against the Treasury... There's some nonsensical talk about a syndicate to be called the Irish-American Republican Association, whose object will be to establish an Irish Republic by purchasing the sovereignty of Lower California from Mexico, or of another strip of land or an island from Canada, Chili, Peru or some other government. It is supposed that rich Irishmen will readily drop their money in the enterprise. Of course, the chief object of the Republic would be to serve as a basis for hostile action against England. No recognized government would ever listen to such a project, and nearly every bit of the world is now under some recognized government..... Samuel Latham Mitchell Barlow, the well known N. Y. lawyer and politican, died suddenly of heart disease, at his home at Glen Cove, L. I., Wednesday, aged 63. His fees were always heavy, ranging as high as $100,000!..... .The British Columbia Board of Trade want reciprocity with us..... Miss Gwendline Caldwell, 25 years old, born in Kentucky and educated in New York, who inherited $2,500,000, and some time ago gave $300.000 towards the founding of a Catholic University at Washington, is to marry Prince Joachim Napoleon Murat, Prince of Cleves and Prince of Berg, grandson of Murat, the first Napoleon's great cavalry marshal, and king of Naples, and of Queen Caroline, sister of the great conqueror. Joachim's mother was a Miss Fraser, a school teacher, whom his father married while in exile with his uncle Joseph Bonaparte, ex-King of Spain, at Bordentown, N. J., where the Prince was born 55 years ago. He was a great favorite under Napoleon the Little, and a great spendthrift. He is a widower with three married children, has a fair property in hand and is suing the Italian goverment for $10,000,000, the private fortune of his grandfather, the King of Naples, shot to death by the Italians after the Battle of Waterloo, in 1815 ..... Two fanatics of Lancaster, Pa., have just prosecuted Farmer Joseph Adams for violating the Sabbatarian laws by getting in his hay on Sunday in anticipation of a downpour. .....Gen. Bragg, of Wisconsin, Democratic ex-Congressman and ex-Minister to Mexico, and a brave soldier, has been dropped from the roll of the Fond du Lac Grand Army by a vote of three to one. The trouble began with his opposition in Congress to the Dependent Pension Bill a couple of years ago .....During a big strike at Duluth, Minn., in a conflict between the strikers and authorities, a week ago, three men were killed and a large number injured .....An English syndicate is now hot after the best American restaurants. Delmonico refused an offer of $1,000,000 for his three places in this city the other day..... The second trial of boodler, ex-Alderman McQuade of this city, is under way at Ballston, N. Y., to which it was removed on the ground that people here had formed an opinion in the matter. So have the Saratoga County farmers, apparently, as it has been a difficult job to get a jury. The trial promises to be long, and a fee of $2 a day with board, is a small temptation to farmers at this busy season..... Lord Edmond Fitzmaurice, the middle-aged and impecunious brother of Lord Lansdowne, ex-Governor-General of Canada, and now Governor-General of India, is about to bestow his hand and courtesy title on Miss Caroline Fitzgerald, an heiress of this city, 26 years his junior. She's somewhat of a poetess, a good classical scholar, and a member of the American Ornamental Society.....The Chicago Common Council, 30 in number, has given the Standard Oil Company the exclusive privilege of laying an oil pipe through the city and maintaining it for 25 years. The city gets not a cent for the valuable privilege; but the boodling aldermen, it is charged, get $30,000. The Mayor may veto the measure, however.....Mrs. John Tyler, widow of President Tyler, died at Richmond, Va., Wednesday evening, of congestive chills, aged 69. The following "White House ladies" are still living: Mrs. James K. Polk and Mrs. Harriet Lane Johnson, Mrs. Grant, Mrs. Garfield, Mrs. McElroy, President Arthur's sister, Mrs. Cleveland and Mrs. Harrison.....The Sugar Trust is fast gobbling up all the sugar refineries in the country. Its last bonne-bouche was the refinery at St. Joseph, Mo., the stockholders of which get $18,000 for doing nothing. About 200 hands are thus forced to do the same, but of course, they get nothing for doing it..... At Carnegie's Homestead Iron Works at Pittsburg, 500 more men went out on strike Wednesday, when the new sliding scale, reducing their meager wages, went into force..... .. Constitutional conventions of the four new States, in session at their respective *pro-tem.* capitals, are hard at work elaborating constitutions. Of course, several crude propositions are being discussed by some of them, but it is quite probable that its new constitution will be the best adapted to the conditions of each State, however it may compare with those of the old States in which the conditions are different. Time enough to tell about them when they're completed.....After the expiration of his term, on Jan. 1, 1890, Gov. Fitzhugh Lee of Virginia, will accept the Superintendency of the Lexington (Va.) Military Institute, where Stonewall Jackson was Professor of Natural and Experimental Philosophy and Instructor in Artillery Tactics, at the outbreak of the war..... Grumbling still continues among most of the sufferers in the Conemaugh Valley, Pa. Thus far $1,750,000 have been expended by the Flood Commission. The maximum number of persons provided with board was 31,950, while the regular commissary roll is now 7,000. All immediate necessities have been provided for, and some payments have been made on account of actual property losses. The local doctors put the number of deaths at 10,000; the canvassers who went through the valley put it at 5,000. The property loss is now estimated at $10,000,000. The relief fund was large enough to give $700 to every family hurt by the flood ... ... Heavy rains in Fulton County, N Y. and a cloudburst near Johnstown—name of ill omen!—caused a tremendous flood in Cayadutta Creek, a tributary of the Mohawk, Monday night. Mills, bridges and other obstructions along the banks were swept away and very heavy losses inflicted. Johnstown was flooded and a crowd collected on a stone bridge crossing the turbulent creek to watch the wreckage rush by. Part of it struck the bridge and knocked it to pieces, 15 people being plunged into the torrent. Four bodies were recovered next morning and one since. Fonda, Gloversville and several neighboring places also suffered severely, and a large number of farmers lost heavily by the floods.. Martin Burke, the Winnipeg prisoner, having been fully identified as one of those connected with the murder of Dr. Cronin, is held for extradition, and stands a splendid chance of swinging for his share in the atrocity..... Mr. Roosevelt, the new Civil Service Commissioner, is gaining golden opinions from all sides on account of his manly way of enforcing the law..... There are now 213 cotton-seed mills in the South, with an aggregate capital of $20,000,000, against 40 mills with a capital of $3,500,000 in 1880..... As was feared, the Cotton Oil Trust has virtually secured control of the Southern Cotton Oil Company, which was to be for all time its unapproachable rival..... Last Monday, at Richburg, Miss., 103 miles north of New Orleans, in presence of over 3,000 spectators who paid $10 to $50 for the privilege of seeing the contest, John L. Sullivan, Boston's Pride, showed his title clear to the pugilistic championship of the world, by defeating Jake Kilrain, Baltimore's Pet, in the 24-foot ring, according to the London prize ring rules, after 75 rounds of square, honest, brutal and brutalizing fighting, lasting two hours and 18 minutes.....

The Unfamiliar.

WITHOUT especial reason, except that it is unfamiliar, we are all disposed to avoid good that comes in unusual guise; and it matters not that it is unusual good.

Nevertheless this is natural: it is right to be careful and conservative. It saves a great deal of trouble. In the end, the endorsement of careful people, which is sure to come if the merits of the case demand it, is all the more valuable.

Such, at least, are our views after 20 years experience with Compound Oxygen.

What could be more hearty than the following?

CHICAGO, ILL., April 24, 1884.

"You ask my opinion of Compound Oxygen. Perseveringly and continuously used, it will work wonders."—*Chicago Inter-Ocean.*
WILLIAM PENN NIXON.

OSWEGO, N. Y., Oct. 30, 1885.

"Compound Oxygen has greatly benefited me. Under God it has given me new life."
REV. JOHN C. BREAKER.

FLEMINGTON, N. Y., Oct. 31, 1885.

"I regard Compound Oxygen as nature's strong right hand for repairing bodily waste and damage." REV. J. C. SUNDERLIN.

ALMA, NEB., Feb. 13, 1888.

"I do unhesitatingly say that Compound Oxygen will cure catarrh."
HON. H. C. GRIFFITH.

COLUMBIA, S. C., March 13, 1888.

"I am satisfied that the Compound Oxygen is an excellent remedy."
DR. O. A. DARBY,
President of Columbia Female College.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 312 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, July 13, 1889.

A NEW national organization of which Editor O'Brien is the author and Parnell the President, has been started in Ireland. When Parnell first decided to make use of agrarian agitation for political ends, he joined Davitt in forming the Land League. When that was virtually suppressed as illegal, he substituted for it the National League. When O'Brien originated the Plan of Campaign for the avoiding of rent-payments, he allowed his colleagues to direct the details of the agrarian warfare. When the Pope condemned it as immoral, the tenants gradually lost faith in its virtues, and the landlords combined their forces and established a Landlords' League. This threatens to expel all malcontent Irishmen—nearly the whole population—and replace them with subservient colonists from England, Wales and Scotland. The new Parnellite organization, called the Tenants' Defence League, is meant to protect the tenants and antagonize the landlords' association. It is in reality the old League with a new name, and a distinct agrarian aspect. It has already received the support of Gladstone, John Morely, Minister Egan, and Archbishop Croke, and is hardly open to criticism from the Vatican. It is supposed that it will bring Liberals of all shades of opinion to its support. The Government will no longer deal merely with the "men in the gap," but with the whole Irish race, backed up by all who favor Home Rule, and who are opposed to rack-rentism. Its chief proclaimed object is "to raise a fund for the purpose of giving legal assistance against combining landlords; and not to divert rent from its proper channels." It's the latest and probably the best device for securing support for the Irish cause, and hampering or preventing hostile action..... Wilkie Collins, celebrated for the elaboration of unguessable plots in novels, has had a second stroke of paralysis at his home in London. He is 64 years of age and has been hard at work grinding out novels all along. As with his friend and co-laborer Dickens, the tension is too great, and, like him, he'll probably die of over-work .... Since their European triumphs in 1870, wherever Germans have made settlements abroad, they have carried things with a high and arrogant hand regardless alike of the rights of the natives and of settlers belonging to other nations. They are now practicing, in the Marshall Islands, the same greed and intolerance that led to the explosion in Samoa. Reports are numerous and loud from English and American traders of the oppression and exactions to which they have been subjected; while the condition of the oppressed and overtaxed natives appears deplorable indeed. The Samoan troubles having been settled, with no great glory to the Fatherland, it looks as if the Teutons were determined to excite an indignant geographical interest in another Oceanic island group also.....Under Captain Wissman, too, they've just been trying to civilize

the East Africans about Pangani by slaughtering several hundreds of them, after which they occupied the deserted place..... When in 1882, Arabi Pasha, commander of the Egyptian forces under Khedive Ishmael, rebelled against the grinding taxation imposed upon the peasantry to satisfy the enormous interest demanded by the foreign capitalists who had recklessly loaned extravagant sums to the spendthrift ruler, England and France, whose subjects were the heaviest creditors, started jointly to suppress the rebellion. The lately established French Republic, however, apprehensively withdrew just as Alexandria was to be attacked, leaving England to finish the work single-handed. England having done the fighting, monopolized the advantages, and France has been disgruntled ever since. After the final defeat of Arabi at Tel-el-Kebr, and the occupation of Egypt by the British, England pledged herself to evacuate the country when it could be done with safety to the financial interests of the creditors of the new Khedive and without danger from internal or foreign sources. Since then France has frequently insisted that England should keep her plighted word by withdrawing her troops; but the English government, which since Tel-el-Kebr has spent $200,000,000 in various military expeditions there, has never recognized a time when this could be done. Like Austria's "temporary" occupation of Boznia and Herzegovina, Turkey's Adriatic provinces, during the Turko-Russian war of 1878, England's temporary occupation of Egypt, Turkey's African dependency, was intended to be permanent.. ....Lately the British government made arrangements with the Rothschilds to convert $135,000,000 of the Egyptian $500,000,000 debt, drawing five per cent. interest, into a four per cent. loan, thereby saving $800,000 interest a year. The only gainers would be the wretched, half starved, overtaxed fellaheen, or peasantry, whose taxes would be lighter. All the Treaty Powers acquiesced except France, which insisted that, as a preliminary, England should name a particular date at which she would evacuate the country. This has blocked the project. The French elections are approaching, and a show of resistance to English projects, especially in Egypt, is sure to be popular among the voting masses; hence the fellaheen must continue to bear the crushing weight of their old-time burthens..... ....Some weeks ago the successor of the Mahdi sent an army of 8,000 fanatical dervishes north from his capital, Khartoum, with instructions to annihilate the Khedive and Queen Victoria unless they embraced the true faith. On their march northward along the Nile, they encountered the Egyptian troops under Col. Wodehouse and other English officers, a week ago, 20 miles south of Wady Halfa, the most southern point now garrisoned by the Anglo-Egyptian troops Of the advancing force 900 were killed and 700 taken prisoners, many dying of thirst, as the Egyptian troops and gunboats on the Nile kept them away from water. They are still pushing north, however, 6,000 strong, and English reinforcements are being dispatched from Malta and other near-by garrisons to block their way into Lower Egypt..... Sir Provo William Parry Wallace, G. C. B. Senior Admiral of the Fleet, is living near Chichester, England, at the age of 99. He was second lieutenant of the Shannon in her duel with the Chesapeake in Boston Harbor 76 years ago, and at the close of the engagement was in command of the frigate because all the senior officers were shot down in action. The capturer of the Chesapeake has been bed-ridden for 10 years but always cheerful. ..... Buffalo Bill has been engaged by the French government to teach 100 cavalry officers to ride in the American fashion. The 100 will instruct others. It is said that Bill will soon deturone General Boulanger in the affections of the French people. ..... The venerable French-American Dr. Brown-Sequard, 72 years old, and famous during over 40 years for his supereminent skill in nervous disorders, told the medical world the other day, through the Biological Society of Paris, that after 20 years of close search for some device for sustaining and prolonging life, he had at last found it. He cuts out certain organs or glands from living animals, crushes them at once in a mortar in distilled water, and from the mass extracts an essence which he uses as a hypodermic injection. He first experimented on feeble animals, with marvelous success. He then administered two injections to himself, and immediately felt 10 years younger while his capacity for work was increased threefold. While the best physicians here praise Dr. B.-S.'s great skill, they believe as little in his elixir of life as in perpetual motion or the philosopher's stone.....

AGRICULTURAL NEWS.

SATURDAY, July 13, 1889.

SECRETARY RUSK on Monday established a division for editing reports and bulletins issued by the various Divisions of the Department, and putting them into language that can be understood by the general reader. These synopses will be furnished promptly to all newspapers throughout the country. George William Hill of Minnesota, will have charge of the work .....The 43d Annual Fair of the Burlington County Agricultural Society will be held at Mt. Holly, N. J. October 7—12. Henry Budd, secretary, Mt. Holly.....Australian apples were received in San Francisco in June, and were sold for $3 per box..... The Farmers' Alliance of Mississippi has leased the State penitentiary of Mississippi and will immediately manufacture cotton bagging on a large scale.....That Fourth of July bale of cotton at Albany, Georgia, reached this market Monday. Primus Jones raised it, Carter & Bradley shipped it, C. B. Taintor received it, and Henry Clews & Co. bought it. The price here was 16⅛ cents per pound, the cotton classing as middling. .....Croft's Mills in South Carolina expect to turn out 300,000 yards of bagging made from pine straw by the first of October. This will make the jute trust pine..... ....The Fourth Annual Fair of the Society of Agriculture and Horticulture of Westchester County, will be held at White Plains, N. Y. September 23-28. All articles are entered free of charge. E. B. Long, Secretary, White Plains ..... Col. R. P. Pepper, of Frankfort, Ky., sold his five-year old horse, Acoyte, by Onward to J. S. Corry, of Massillon, Ohio, for $40,000... A curious blight has seized upon the maple trees lining some of the most exclusive streets in Brooklyn, notably Quincy Street and Nostrand Avenue. The blight consists of millions of caterpillars, which have laid their eggs along the under side of the smaller branches and caused the leaves to wither. Although English sparrows are plentiful, they seem to pay but little attention to their fellow pests.. .....Smith Scudder, living near Plainfield, N. J., was killed on Monday afternoon by being thrown from his mowing machine in front of the knives.....State Dairy Commissioner Brown had a conference with the cider-vinegar makers on Tuesday. The question discussed was how best to enforce compliance with the law passed this year prohibiting the adulteration of vinegar, more especially by the whisky-vinegar makers of the Western States, who, it is alleged, sell their adulterated productions in this State. It was stated the Vinegar Trust, which was composed mostly of Western manufacturers, went to pieces about three months ago, and since then the competition has been so great that little if any profit is derived from the vinegar industry .... The ornithologist of the Department of Agriculture has little doubt that the beneficial qualities of the Cedar bird, or Cherry bird, exceed its injurious ones. It does much good by destroying injurious insects .....The New York Hop Growers' Association will have its annual picnic on Sylvan Beach, Oneida Lake, July 27..... A Percheron stallion chased a Pennsylvania man in a dog-cart for three miles, and smashed the cart after the man had escaped to a place of safety. Secretary Rusk has been presented by Gen. Felix Agnus with a milk white percheron horse, 17 hands high, which the Secretary rode at the party at Gen. Agnus's several weeks since. He says he will send the animal to his Wisconsin farm .....Some days ago the State officials of New Jersey notified Secretary Rusk of their intention to raise the quarantine against pleuro-pneumonia. To this the Secretary made a vigorous protest, appealing to the State officials to aid the Department in protecting the export cattle trade of the country against the ravages of the disease, which is now confined to the territory in the immediate vicinity of Jersey City. In case the local quarantine is raised, however, the Secretary gives notice that he will at once establish and enforce national regulations to effect the desired end.....

Market Notes.

SATURDAY, July 13, 1889.

THE supply of fruits of all kinds in this market is abundant, and the quality generally excellent. The shipments of apples fully equal the demand which is only moderate. A variety known as the Hosse from Georgia, opens up well. Peaches are plentiful, and there is a good demand for the best qualities at good prices. They come mostly from Georgia and California. Pears are abundant. Some very fine Le Contes from Georgia, and Bartletts from California are offered. The first car lot of California Bartletts came last Saturday, and were held at $4 to $4.50 per 40-pound box. Cherries are about out of market. Plums and apricots are plentiful.

New York is supplied with the luscious fresh fruits of California through the California Fruit Union, now in the third year of its existence. From May 1 to November 1 cherries, apricots, peaches, plums, pears, nectarines and grapes are sent to this market, and owing to a perfect system of transportation in refrigerator cars are delivered generally in good condition. The fruit is shipped through by express in six days, and is sold by auction on the morning of arrival, so that there is very little delay in reaching the consumer.

The present season opened about June 1, since which time eight or nine car-loads have been received and sold, one of the sales being a full car-load of cherries. E. L. Goodsell offers on Monday, next, at auction 803 boxes and crates royal apricots, 39 boxes peach plums, 360 boxes Bartlett Pears, 88 boxes German Prunes, 132 boxes Purple Duane, Washington, and Magnum Bonum Plums.

Prices for these fruits have generally been satisfactory excepting for apricots which have been very low. Small fruits are abundant and cheap. Red and black raspberries, blackberries and huckleberries retail for 10 cents for the best, and lower for other grades, the price depending upon the stage of decay. The warm, damp weather has been very unfavorable for handling such fruits. As is usually the case, the best grades bring good prices, while much poor trash will not pay shipping expenses.

While tropical fruits are not so much of a dependence as they were earlier in the season, they still form quite an important source of supply. Oranges are not very plentiful, but bananas, pine-apples and lemons are in profusion everywhere. Havana sugar pines may be had for 10 cents, three for a quarter. Hucksters go about with their wagons piled high with lemons, in the same way the farmer draws potatoes or cider apples, and a quarter will purchase 25 fine ones.

The vegetable market is weak, there being heavy arrivals and only a moderate demand. Potatoes are growing more plentiful and the price is constantly declining. Cabbages are very low. Good cucumbers are in demand, but poor ones not wanted; tomatoes, ditto. Very good sweet corn from nearby gardens is offered, and brings fair prices. There is a demand for good egg plant. Some asparagus is still offered, but it meets with slow sale. There is a large supply of beets, carrots, turnips, squashes, etc.

The supply of butter far exceeds the demand, and prices are lower in consequence. Much good butter is being bought for cold storage, but poor grades are not wanted. Eggs are well cleaned up, and prices have advanced accordingly.

Literary.

NECESSITY OF EDUCATING FARMERS' DAUGHTERS.

LAURA A. REINHART.

THE true end of education is the harmonious development of mind, body and spirit. All educating forces which act upon the individual should bring about symmetrical development. Our present ideal of an educated person is so high, so noble, so pure, that the term "educated" can not be applied unless the individual demonstrates this threefold development. Man is endowed with innate powers that are susceptible to all educating forces that are brought to bear upon him. When these powers receive systematic and proper exercise, the progress is greatly enhanced. The age is past in which woman was considered inferior to man in these natural endowments of moral, intellectual and physical powers. Woman has proved o be man's equal in a great many of the arts and sciences; and in the science of practical ethics and in the fine arts his superior; so that the plea of inferiority is no longer accepted by our best critics. What she lacks in physical energy, she more than makes up in moral force. I think that all reasonable persons will accede that woman is endowed with the same faculties as man, and if developed and trained with equal care and attention, she promises the same degree of usefulness. The fact that farmers' daughters have not, as a rule, attained to the same degree of intellectual development as their sons, does not argue that they have not the possibilities; but rather proves that they have been, as a class, greatly neglected. Again, if we compare the average country girl with the average town girl, we must accept the former's inferiority in this one phase of the question—mental training. But do not judge too hastily.

Let us look for a moment at the kind and amount of physical training farmers' daughters receive. Even in early childhood, they are brought under those influences that are conducive to a healthful, bodily growth:—a large scope of territory over which to roam, few desires that are not gratified by the silent, yet persuasive influences of Nature all around, teaching lessons of activity, of cheerfulness and unselfishness. In our rural districts Nature has full sway over child nature. The songs of birds, the babbling of the brooks, the rustling leaves, all produce a harmony sweeter, grander and more perfect than the commotion in cities and towns. In fact, the very environments of children living in the country are conducive to healthful physical growth. It is a fact beyond doubt that farmers' daughters are favored with bodily training, which makes them useful in after life. We are awaking to the fact that the seemingly undue attention which the early Spartans have to their daughters was not a mark of weakness; but rather of an intellectual insight into the true order of development. A mind that resides in a heal hful body has more chances for development than one in an ailing body.

Why is industrial education all the rage the world over? Men are realizing that the mind in too many instances has been educated at the expense of the body. It is, however, not necessary to urge farmers to give more physical training to their daughters. Do we not find that, in many instances, the farmers require of their daughters the same manual work as they do of their sons? Is not a caution in place? Is it right to take your daughters out of their proper spheres and deprive them of the most careful training in household affairs, by obliging them to do work in the fields? I am glad to notice that this practice is on the decline.

It will not be out of place to notice the moral culture farmers' daughters receive. I wish to state, right here, that the conditions of a healthy, moral growth are more generally met with in the country than in cities and towns. Removed from the enticing influences of fashion, which first infatuate, and then ridicule; removed from the frivolous and the gay; from perilous centers of vice and immorality, we realize that we are highly favored when we receive our training in the country. The pure air, the blue, unclouded sky, the shining sun, the springy turf beneath our feet are all we require to make us feel that we are in regions of delight. All these speak in some way to the spirit and raise new emotions of purity. Farmers, as a rule, give much attention to morality, truthfulness and early piety. The lessons of morality which children in country districts receive, are not counteracted by vicious associates and the manifold wicked influences which stunt the keenest sensibilities, dampen the purest emotions, inducing so many young people, coming from respectable families, to lead irreligious lives. How many young ladies who have left their country homes, with all principles of morality and Christian sobriety deeply written upon their hearts, may be with a mother's tears, on coming into towns where they are brought under the vile influence of corrupt society, have yielded and become wrecks on the quick-sands of time! Friends, we need to give the greatest attention to make our daughters morally strong. The future actions and conduct of your daughters proceed from the prevalent state of their minds, as water flows from the fountain. Impure thoughts will lead to impure desires, and impure desires will lead to improper actions. We need to guard the rising generation more than ever, as the tendencies of the age in which we live are toward immorality.

But let us, in the next place, notice a few reasons why farmers' daughters should receive due mental discipline. Is it not in many communities the prevailing sentiment that girls do not need the same amount of education as boys? This is especially true of a great many farmers. While they greatly care for their daughters in providing for them food, clothing, and future legacies, they fail to see how utterly helpless they leave their children by not giving them, at least, a fair education. Is there any reason why country girls should not be polished for society? It is an incontrovertible fact that farmers have the means to do this. Why, then, is this deplorable neglect of allowing so many fair maidens to grow up in ignorance? Is it not because so many farmers have a wrong conception of life? A great many good-hearted, sober-minded and industrious farmers consider the true end of their being reached, when they have provided for their daughters houses and lands. These provisions are right and proper in their place; but without a well disciplined mind, without true Christian courtsey and refined manners, these material things will not lead to true joy and happiness. Make home-life beautiful, and parents will sow seeds of gentleness, true kindness, and fidelity in the hearts of their children, from which they will reap happiness and virtue. But how is this possible where ignorance is supreme? And as the daughters of our farmers promise to become the mothers of future generations; and as mothers have the privilege of giving the first lessons in this triune development of mind, body and spirit, how important it is to properly educate them for this grand and noble work. How many great men give warm tributes for their success to their intelligent mothers? The memory of the happy home of childhood is the grandest legacy any farmer can leave to his children.

The hallowed influences of a home in which there was a strong, social element, and refined manners, will never be forgotten. A home in which there is ignorance is full of darkness and gloom, while a home in which there is culture and refinement, is full of sunlight and joy. Educate your daughters and their homes will be graced with pictures, refined by books, and gladdened with sweet music. You will have homes in which there will not be the blasts of passion, no storms of hate. You will have homes in which the wife and mother shall not lose her charms by unremitting drudgery and toil. Educate your daughters and we will have homes in which happy children shall see the beauty of love and the beauty of holiness. We will have homes of plenty, of sympathy, of self-sacrifice, of devotion. Homes of culture and of love.

MAGAZINE REVIEWS.

A MAGAZINE devoted to the interests of all women, especially those engaged in active pursuits, is the Business Woman's Journal. The July-August number gives a short sketch of Mrs. Ella Dietz Clymer, the new president of Sorosis, of which she was one of the incorporators. A very interesting sketch is given of Clara Barton, "the angel of the battle-field, the pestilence and the flood," who has recently been again brought into prominence through her devoted labors among the sufferers at Johnstown. Senator Sumner once wrote of her: "She has the talents of a statesman, the command of a general, and the heart and hand of a woman." Short sketches and incidents are given of Wi-ne-ma, the Indian woman who saved the life of Col. Meacham, at the lava-bed massacre, Mrs. Emma F. Pettengill, a successful Brooklyn stenographer, and many others. "What Occupation Shall I Choose?" is a very valuable article for the times. The magazine is replete with valuable information for the large and ever-increasing army of business women. Mary F. Seymour, 38 Park Row, New York.

PANSY for July cannot fail to please the little folks for whose benefit it is published. It contains, among many other sprightly stories, several Fourth-of-July poems and sketches. "Margaret's Fireworks," by Pansy, is a bright little story with a moral to it. "A Practical Joke" tells how a naughty boy played a very cruel trick upon a helpless cat, and how he was punished for it. The illustrations are numerous and excellent. D. Lothrop Company, Boston, Mass.

TO FIND a new field for magazine work, in this time of the reign of magazines, would seem almost an impossibility. Yet this honor belongs to the publishers of "The Home-maker," of which Marion Harland is the editor. We have met many of its contributors before, in the pages of other household literature. Christine Terhune Herrick, for instance, who edits the department called "With the Housewife," and Catharine Owen and Anna Alexander Cameron, who write for that department. In the body of the magazine, the current number, which is the fourth of Vol. 2, contains poems by May Rebecca Lenox, Katharine Philips Williams, and Margaret E. Sangster; an editorial on "Advice-giving;" a short sketch of John Randolph, "J. R. of R.," which leaves a new and more pleasing impresssion of him than we have been wont to have; four chapters of "Hope Harding," a serial by Lucy C. Lillie; the concluding portion of a fine description of a fine "Old New York Homestead," by the Editor; "Guenn at Home" written and illustrated by Walter Satterlee. "In Wonderland, No. 3," in which Estella Thomson describes the Home and Harvest of the Fig; "Household Decoration No. 4," by Hester M. Poole; and "A Stranger," a pathetic story by Ella Thomson. The above fill about half the pages. The rest are devoted to the special departments: Our Young People, Our Baby, etc. One would almost say the departments were too many, the articles too short. Among the many very fine illustrations two noticeable ones are: "Guenn" which forms the frontispiece and which, though perfect in its way, doesn't look the least like one's ideal "Guenn," and a copy of the fascinating Gilbert Stuart portrait of John Randolph at 32, which the beholder would swear was the likeness of a beautiful, dreamy lad of scarce 16.

BOOK REVIEWS.

ONE of the most charming of American writers was Hawthorne, and one of the best of his works is the Scarlet Letter. This popular novel is now published in the "Riverside Paper Series" at the low price of 50 cents, which places it within the reach of many who could not afford an expensive binding. Houghton, Mifflin & Co., Boston and New York.

ALLURING ABSURDITIES.—Fallacies of Henry George, is the alluring title of a pamphlet by M. W. Meagher, in which he purposes, first, to overturn erroneous theories and false teachings on the great question of wages, and, second, to suggest practical remedies for existing evils involved in that question. The book deals mostly in theories, and, in common with other theorists, the author has fallen into numerous "absurdities." He would remedy existing evils by statute limitation of wealth, a minimum of wages below which no man shall work, and a graduated income tax, so that the larger a man's income, the more tax he shall pay, proportionally. He very sensibly gives the leading cause of poverty as intemperance, and he admits that this is not a theory, but the result of "observation and experience." There is a large class of persons in this country who imagine that all existing evils can be remedied by legislation. To such, this book will be especially welcome. Price, 25 cents, American News Company, New York.

SEED WHEAT
STRAWBERRY PLANTS, FRUIT TREES, SMALL FRUITS, DUTCH AND CHINESE FLOWERING BULBS, WINTER BLOOMING HOUSE PLANTS, FANCY POULTRY, PEKIN DUCKS, BRONZE TURKEYS, GERMAN HARES, &c. Our annual Fall catalogue, 1889, of Seed Wheat, Plants, Poultry, &c., will be ready by July 20. Samples of 7 new, hardy and productive varieties of Winter Wheat, including the ironclad **RELIABLE** and celebrated **LEHIGH No. 6.** will be sent with catalogue for 10c. in postage stamps. Address, **SAMUEL WILSON, Mechanicsville, Bucks Co., Pa.** Catalogues free on application.

CATALOGUES, ETC., RECEIVED.

PROCEEDINGS OF THE AMERICAN FORESTRY CONGRESS.—The report of the meeting held at Atlanta, Ga., last December, makes a pamphlet of 55 pages. All who are interested in forestry will find something to interest them in this pamphlet.

MINNESOTA EXPERIMENT STATION.—Bulletin No. 7 of this institution contains a number of interesting articles. This station seems to be doing good work. Its bulletins are always readable and plain. Some experiments have been made to try to determine the best varieties of corn for ensilage. This is an important matter in a State like Minnesota where the silo is becoming a recognized feature of stock farming. Most of the silo advocates have urged farmers to plant the large Southern corn for ensilage. Because this corn gave a large, fine-looking stalk, it was supposed to be superior to local corns for the silo. Last year Prof. Porter of the Minnesota Station, conducted some experiments that went to prove that flint corn, such as was ordinarily grown in the State, gave more value in silage than the larger Southern corn. This year's experiments, quite elaborately conducted, indicate the same thing. The fact seems to be that the local corn that gives best results for grain and stalk in any given locality is also the best ensilage corn that can be found. This has been shown at other stations and it seems pretty well settled. Some experiments with warm water for cows show the same results as those of last year. There was practically no difference in effect from the warming of water to 70 degrees or cooling it to 32 degrees or ice-cold when given to cattle which were comfortably warm at the time. There is quite an interesting article on cross-fertilizing corn, which the R. N–Y. will refer to at a later date, as also an illustrated article on washing and salting butter. Some drawings of different methods of constructing greenhouse walls are very well done. As a result of his experiments, Prof. Green remarks that probably the cheapest warm wall for general farm purposes is one made of wood with a four-inch air-space which is filled with dry sawdust or some other good non-conducting material.

When a hollow wall is to be filled with sawdust or similar material, it is all-important that the material should be dry when put in and then be so protected that it cannot get wet either from water coming in at the top or the sides.

In making a dead-air space the sides of the wall should be tight both inside and out, in order to prevent any circulation of air and to have it a true *dead-air space.* Dead air is the best of non-conductors, but its efficiency depends to a great extent upon the number of times it is broken up and multiplied.

While dry sawdust gave very excellent results as a filling for walls in this case, it is probable that dry chaff, cut straw or hay would answer nearly as well for the same purpose.

ALFALFA.—ITS GROWTH, COMPOSITION, DIGESTIBILITY, ETC.—This is the title of Bulletin No. 8 from the Colorado Experiment Station, Fort Collins, Colo. It seems hard for Colorado people to say too much in praise of Alfalfa. Many Eastern farmers have tried the plant, with varying success, but after they have said all they possibly can in its favor, the fact remains that Alfalfa attains its highest state of perfection in the dry, hot regions of the West. Nature designs this wonderful plant to fit in where other plants might fail. This being the case, it is right for the Colorado Station to seek to determine the best modes of culture and handling. We give below the substance of what the station has determined.

For hay use 20 to 25 pounds of seed; for seed, 12 to 16 pounds. For hay on sandy soil, sow the seed alone; on cloddy or clayey soil, sow wheat, oats and barley in small quantity. Timothy and Orchard grass sown with Alfalfa, keep it from lodging, and become a preventive of hoven in the feeding of cattle and sheep. Sow with a drill, as soon as all fear of frost is gone. Cut just before blooming—somewhat earlier than Red clover. When slightly wilted, rake into windrows and then put in small cocks to be cured. Alfalfa is a dangerous pasture for cattle or sheep. When fed green or wet it seems to have a greater tendency to bloat cattle and sheep than any other forage.

Some experiments were made to determine the comparative chemical value of Alfalfa and also its digestibility as compared with other foods. Here are the conclusions:

1. The quantity produced by the many cuttings make it much more valuable than the other clovers or grasses.

2. It is as digestible as clover hay, constituent by constituent.

3. Its chemical composition shows that it is a rich, strong food, when properly cured.

4. Its feeding qualities are excellent, being relished by all farm animals.

5. It is also an excellent flesh and milk-producer. In general, it will do to say that it has about all the good qualities of a forage plant, with very few poor ones. It has shown a tendency to split up, or diverge into several well marked varieties, under careful cultivation.

AMERICAN VETERINARY COLLEGE.—The catalogue of this institution, which is located at 139 and 141 West 54th. Street, New York, is sent by the Dean, Dr. A. Liautard. This is an excellent college, and its popularity increases year by year. Located, as it is, in this great city, it is possible for the managers to secure a vast number of sick or wounded animals for treatment, and this work, of an eminently practical nature, is made a very strong feature of the college course. The R. N.-Y. has frequently pointed out the possibilities open to the skilled veterinarian. We can only say that this college affords excellent facilities for securing a thorough groundwork in the principles of the science.

"MURRAY" BUGGIES AND HARNESS.—Catalogue from the Wilber H. Murray Manufacturing Co., Cincinnati, Ohio. Every reader of the R. N.-Y. ought to be interested in a good bargain. It is also highly probable that 90 per cent. of its readers need a harness or a carriage of some sort. It naturally follows that this catalogue will be apt to give them about as much pleasure as any similar volume ever can. Farmers will be sorry if they do not look into this matter. The prices quoted for harness and buggy are certainly very liberal. The goods, as we are informed, are well-made and durable. "No pool for us" is the firm's motto. If these prices are the result of that decision, what must be the profit on harness and carriages sold by others? Send for particulars to the above-named firm.

WHITMAN AGRICULTURAL CO., ST. LOUIS, MO.—The new catalogue of this excellent house is an elegant affair. The fine hay presses for which the Whitmans are famous, would bring credit enough to any house, yet it appears that there are dozens of other implements made at St. Louis, the making of any one of which would afford business for an ordinary manufacturing company. Horse-powers, wood-sawing machines, corn-shellers, grinders, cider-presses, seed-sowers, harrows, scrapers, trucks, cars, cutters—in fact just about everything. There are 175 or more pictures of implements. This statement gives an idea of the wonderful business conducted by the Whitman Company. This is a fine house to do business with.

THE GREATER HALF OF THE CONTINENT.—This is the title of an article originally written by Mr. Erastus Wiman for the North American Review. It has been reprinted in pamphlet form and quite extensively distributed throughout the northern portion of the United States. Mr. Wiman, as is quite generally known, is an enthusiastic advocate of a "commercial union" between the United States and Canada. His object in preparing this pamphlet was to make a special plea for Canadian resources and possibilities, so that the "Yankees" might understand that the proposed "commercial union" would not be such a jug-handled affair after all. And he certainly makes out a very good case for Canada. Without Alaska, the United States include 3,036,000 square miles. Canada fills out 3,470,392 square miles! We think so much of our own country that we are apt to think of Canada as a narrow strip of land along the St. Lawrence river, forgetting all about the immense areas of undeveloped, yet wonderfully fertile lands that stretch away to the north and west. Another popular American idea, is the belief that Canada is a region of frost and snow—most of it a sterile and inhospitable waste. Mr. Wiman combats this idea, and undertakes to prove that the Canadian climate has, on the whole, as few drawbacks as are to be found in any section. Between the lines of latitude which include the greater portions of the Dominion, he says the development in the United States has been most marked. Nothing in the history of the world can equal the development of the commerce of the great lakes. Another test of climatic advantage is found in the ability of Canadian soils to produce wheat. The steady movement of the wheat-producing regions of this continent has been to the north. Plenty of R. N.-Y. readers can remember when the Genesee Valley in New York State was the great producing region, with Rochester as the "Flour City." The wheat region has moved. The nursery and seed business has made it necessary for Rochester to spell her name differently as "Flower City." Minneapolis is now the center for wheat and flour, because the wheat-producing regions have moved north and west. They must go on in the same direction. Are the "British capitalists" who are reported as buying up flouring mills foolish or do they know that within a few years the natural course of wheat culture will drive the profitable region over the Canadian line? Canada is dotted with lakes and streams. These tend to equalize temperature and at the same time provide an abundance of fish-food. The distance between Hudson and James Bays and the large cities of our Western and Northwestern States is much less than that between these cities and the Atlantic ocean. The fish that fill these bays could be transported to the Western cities much more easily than they are now brought from our coast. Mr. Wiman finds an agricultural advantage even in the intense cold of the Northern Canadian winters. Ages of long winters have produced a frost line in the earth far down below the surface. During the warm Canadian summer, so Mr. Wiman argues, this bed of frost is turned, by the bright sunshine, into a well-spring of moisture, constantly exuding and supplying the delicate roots of the wheat plant with needed food and drink. Canada is also admirably suited for the production of barley for brewing purposes. As for timber, there seems absolutely no limit to the forests of pine and other valuable woods that await the woodman's axe. And these forests are just as conveniently located as regards transportation facilities, as are those of Michigan or Wisconsin. And again with minerals, Mr. Wiman claims that no country in the world possesses so much iron as Canada, in no land is it so easily mined, and nowhere is it quite so easily accessible to manufacturing centers. Copper, nickel, gold and silver are also found, while thousands of square miles of coal deposits are known to be ready for the miner. Add to this the vast stores of mineral phosphates that Canada boasts and we have a dazzling array of mineral wealth.

Now, says Mr. Wiman, "What destiny awaits it all?" His answer is summed up in a few words: "A political union, to those best informed, seems most difficult and distant. To these, however, a commercial union which, so far as trade and commerce are concerned, would be just as advantageous, is among the early attainable possibilities."

In a recent address before the students of Colby University in Maine, General B. F. Butler discussed this question of a "commercial union" with Canada, which is certainly the most important question of the day to those who live along the Canadian line. Gen. Butler referred to the surprise frequently expressed, that Canada did not join with the 13 American colonies in the War of the Revolution. At that time Canada was no more a British province than Virginia or New York. She had a large French population which fact would seem to make her hostile to England. Why did she not rebel? It appears that the Pope refused to allow the Canadian Catholics to take sides against England. His belief was that England would conquer America. In that case, those who remained true to English interest would be surest of reward. The Pope was mistaken as to the result of the war. Suppose Canada had joined the 13 colonies! Would the history of this continent have been different?

INTER-STATE COMMERCE COMMISSION.—The rules of practice governing cases and proceedings brought before the Commission are sent by the secretary, Edward A. Moseley, Washington, D. C. They are handy for reference.

ELLWANGER & BARRY, ROCHESTER, N. Y. Circular of strawberries, naming the best old and new varieties. The pot-grown plants are recommended to all who desire to obtain a good crop of fruit the first season. The Mills grape and Windsor cherry are also catalogued.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

REMEDY AGAINST A PRIVATE NUISANCE.

L. N. L., New York City.—I own a nice house in a country village up in Connecticut within two hours' ride of this city. My neighbor's house adjoins mine, or rather an ell jutting off the back part of it. My neighbor keeps a lot of poultry, and close up to my ell, he has fenced off a hen-pen 30x50 feet, and in this he persists in keeping from 50 to 60 hens and four or five roosters. For about one-third of the pen he used the walls of my basement to the ell as a fence, so that his hens are directly under my kitchen, and but a short distance from my dining-room and bed-rooms in the second story. In warm, damp weather there is a sour, sickish odor coming from his pen, and when the windows are open it comes into my house. I have remonstrated with him twice for keeping his hens so close to my house, to the annoyance of my family, but he always gets mad and abuses me. The Board of Health claim that they have not the power to kill or remove the poultry or make him do so; they can only compel him to keep the pen clean. This they ordered him to do. Ever since he found out that I had lodged a complaint against him, he has been trying in every way to annoy me. Is that hen-pen a nuisance? If so, is it a public one? If so, has the village a right to abate it? If it is a private nuisance, what is my remedy? The hens are nearly as annoying to other families on the street as to mine.

ANS.—The hen-pen appears to be clearly a nuisance. It is not a public nuisance, because that is one which arises from violation of public rights, and produces no special injury to one more than to another of the community If the fact of the nuisance can be established a court of equity will issue an injunction against its continuance, or a suit for damages may be brought in a court of law.

RURALISMS

Notes from the Rural Grounds.

A REMARKABLE VINE.

ABOUT six years ago, the R. N.-Y. received from Ellwanger & Barry, a single plant of this remarkable vine. It was planted on the north side of an arbor already well covered with Clematis, Dutchman's Pipe and Chinese Yam ("Cinnamon" Vine), so that its roots and the growth for a year or so could never receive sunshine either in the morning or afternoon. In this close northern exposure it grew rapidly, endured the winters perfectly and it is now the most notable exponent of a rapid, peculiar growth we have ever seen.

From the roots issue three main stems each of the same diameter—about one and one-half inch. These older stems exfoliate the bark just as does the old Ninebark, Spiræa opulifolia, now changed to Neillia opulifolia by shameless, heartless botanists who are never happier than when they can upset and confuse the lessons which their instructors taught, and which have been learned moderately or fairly well by the average school girl or boy. The stems, before they are old enough to shed their bark, are of a light brown or drab color speckled with tiny dots of light gray. The leaves are of a dark-green color, ovate acuminate, just a trifle inclined to heart-shape at the base, and minutely and sharply serrate. The petioles are about two inches long, of a red color and covered with short hairs.

After this vine, which bears the name of Actinidia polygama, has become fixed in its new quarters, the second or third year let us say, its growth exceeds that of any vine we know of. It is supplied with neither tendrils

ACTINIDIA POLYGAMA. From Nature. Fig. 183.

nor adventitious support. A shoot will start out at a right-angle with the stem and grow almost horizontally or at any angle until it reaches an object. Then it twines, curls itself about the object several times and continues its course until it reaches another twig or branch, when it makes two or three turns about that and still grows on. The stems thus closely encircled are held as if by an iron cord to be choked to death as their growth demands more space.

The specimen of which a section is shown at Fig. 183, has nearly taken possession of a latticed octagon arbor about 10 feet high by five across. It has reached out arms on all sides sometimes extending them horizontally, or nearly so, for 10 or 12 feet without support, until reaching the trunk or branches of the nearest tree it has, serpent-like, climbed up to the top and there as if not half satisfied reached out and circled about for other objects upon which to continue its wonderful growth.

About the arbor above alluded to are four magnolias from 15 to 30 feet high and distant from 10 to 15 feet. The Actinidia sprays wave gaily from the tip-topmost branches of all. Another peculiarity of this peculiar vine is that the many branches are of nearly the same girth whether six or 20 feet from the roots, being from a-half to three-quarters of an inch in diameter. The leaves are sometimes opposite and for the rest irregularly alternate. The leaves vary greatly in size, some of those from the older wood being as large as five inches long by four across.

The white flowers are sufficiently well shown in the illustration not to need any detailed description. They begin to bloom here early in June, continuing about two weeks. They are white, fragrant of a "woodsey" odor and rather fleeting. A few days ago the writer was looking over an illustrated Japanese work recently published. This Actinidia according to it, is found in many parts of Japan. The mystery is that it has not been introduced to this country before. The book states that it becomes arborescent with age.

We have no doubt that, confined to a single stem, it would in a few years make a fine tree. "It often stretches across ravines," the account continues, "or climbs about and entangles the tops of the branches of trees. In June two or three leaves toward the top of the branches become snow-white." This has not occurred in our own specimen. The book says that the "fruit, which is the size of the top joint of the little finger, can be eaten either raw or prepared by drying. When fully ripe it assumes a reddish-yellow color. It contains many seeds." The book states that cats are "exceedingly fond of the stems and leaves and eat it voraciously. They even rub their bodies over upon it. Whenever the leaves or stems are burned, cats follow to the source of the odor, gathering about the fire, rolling upon their backs secreting an abnormal amount of saliva and seeming for the moment as if mad."

The R. N.-Y. cats having been supplied with a lot of the stems and leaves, regarded them with utter indifference. The work says that persons "suffering from cramp, or colic use a decoction of the leaves," and it is said to be a very effective remedy.

Finally, friends of the R. N.-Y., if you want a quick-growing vine that is absolutely hardy; that will grow luxuriantly in a northern, shady position; that will travel from tree to tree, forming pretty arbors and wild entanglements, try the Actinidia polygama.

That this vine has not been referred to by the rural press before, is probably because the editors and writers thereof know nothing of it. It is really a grand plant in its proper place.

OLD RUBBER BOOTS.—Nearly every one on the farm wears leather boots, and also buys a pair of rubber boots for the deep snows and slush of winter and spring, and they do good service in keeping the feet dry and comfortable, so by the time warm weather comes on, by reason of cracks and holes in the feet, they are thrown away 'till the "tin peddler" comes along and carries them off for a cent or two a pound. During the summer season most farmers wear heavy shoes on the farm, because they are more comfortable than boots in warm weather. But to get the cows during a rainy morning in the tall, wet grass, or to catch the horses that have been "turned out" over-night is a disagreeable duty, for one comes in wet nearly to the knees, which is not pleasant. Well, take those old rubber boots that reach to the knees, cut the worn-out feet off and during rains or mornings with heavy dews, just put on these rubber leggings; then put on your shoes, and you will take some comfort, and bid defiance to the wet grass.

THE COLT.

THE FIRST YEAR OF ITS LIFE.

How the Farm Horse Starts.

FEEDING, HANDLING, TRAINING.

PRACTICAL FARMERS TALK.

FROM JOHN M. TRUE.

My experience in the raising of horses has been largely confined to grade draft stock. I have a high-grade Percheron that now, when 20 months old, weighs 1,400 pounds. He is in only fair condition, and in no sense coarse or ill-proportioned. He was dropped in September, ran with his dam through the winter, and was weaned when six months old. He was fed generously on oats, wheat bran and good hay until pasture was good, and then during the summer ran on June Grass pasture without grain of any kind. I consider the care and feed here mentioned well calculated to produce the best results in rearing the young colt.

I am satisfied that the fall colt has many advantages over one born in the spring, especially when the dam is to be worked while suckling the colt, as there is less danger at this season of injuring the colt from overheating the dam. Again, the fall colt after he has been weaned goes at once upon grass feed and there is little danger of checking his growth at this trying period. The spring colt that runs with his dam,—the mother not being worked—until he is about six months old, if he is then well fed with oats, bran, hay and corn fodder during the winter, with a good stable at night and a sheltered yard for a daily run, should do nearly as well as the fall colt. But if the dam is worked during the summer, the colt should not be allowed to follow the mother in the fields or upon the road, but be taught to remain in a roomy stall or paddock while the mother is at work. Care should be taken that the dam be not overheated or excited, rendering her milk unfit food for the colt. During the first month the colt should be allowed to suckle the dam every two or three hours. He should be taught early to eat grain and then be fed liberally. He should also have ample means for exercise. Exercise for the colt the first year is all-important. Plenty of feed regularly given, and plenty of exercise regularly taken insure healthful development.

Handle the colt from birth. Teach him that he has nothing to fear, and he will soon become gentle and easily handled. Halter-break him while young.

The young colt should be fed and handled for continuous growth and development. If stunted during the first year from lack of feed or from exposure, he will never fully recover from the ill-treatment received. I have no confidence in the desirability of any toughening or hardening process in the raising of young animals, by short or improper feed, or by an uncomfortable exposure to the elements; but if from necessity or prejudice, this ordeal is ever to be passed by the colt, he should be spared during the first year.

Sauk County, Wis.

M. H. C. GARDENER.

I consider it just as necessary or important for a farmer to raise colts, as a part of the farm production, as it is for him to raise calves to replenish his dairy, or ducks, chickens, turkeys, etc. They are all insensibly growing into money, something that the farmer of the present day of low prices, sees or rather handles but little of. It costs but little to raise a colt, and no more to raise a good one than a scrub, except a little more in first cost. And it soon grows up to be a three or four-year-old, and the owner discovers that he has an available horse at but very little cost; whereas if he went out to purchase a horse that would suit him, he would find that it would cost him from 150 to 250 hard-earned dollars. That is just the difference between raising a colt and buying a horse—the colt imperceptibly grows into money and very quickly too; while it takes money and plenty of it to buy the horse. I have raised a number of colts, and, when a boy, my father raised a good many, so I have had a fair opportunity to observe how a colt should be treated, to thrive and become available for service when three or four years old.

THOROUGHBRED STALLION, TRUEFIT.

Re-engraved From The London Live-Stock Journal. Fig 184.

I have seen many a young horse by the side of which the owner could stand and pointing to his noble-looking animal could say: "There's a horse that never ate a quart of feed in his life from the time he was weaned until he was broken to work;" but when he puts his noble-looking horse to work he finds that the animal is still a colt, for he has no stamina for work, because he hasn't been braced up with feed during his growing years, to fit him for the activities that fall to the lot of a four-year-old horse. I have seen very many cases where colts had only hay to eat in winter, and where they seemed to thrive on it and fill out in shape, but the muscle-building process did not keep pace with the growth and development of the body. A colt needs good feed and must have plenty of it if the owner expects a four-year-old horse to do road or farm work to a moderate extent.

My way is to keep the mother in a well-fed, healthy condition, and after the colt is foaled, she ought to do no work for two weeks; but this rule is hard to follow, where farmers are short of horses, and during the busy season too. Then when she is put to work she is fed liberally, and the colt is not allowed near her when she comes in from work very much heated. I never allow a colt to follow the wagon when taken off the farm. A colt soon learns to turn around and go into the yard when the mother is driven away. Teach the colt to do this while he is young, and it saves a good deal of worry and trouble.

By the time the colt is ready to be weaned it has learned to eat feed with its mother, so one can give it a small ration of feed—bran, middlings or not very strong feed till cold weather. During winter I keep the colt in a box-stall, and feed three or four quarts of middlings once a day, and after the cattle have been shut up for the night I let the colt have the run of the yard, to be shut up again in the morning. This gives him the necessary exercise and a colt seems to prefer the open yard at night to the stall, no matter how cold the weather is. Be sure to halter-break the colt when a few weeks old. Doing so saves much future trouble. The next season he may be turned out to grass and the following winter he should be well fed on muscle-producing food, and then it is well to make him familiar with harness. Towards spring drive him alongside a trusty horse a few times, but with no load to draw.

With this method of bringing up a colt you will find that when he is three years old you have a healthy, well-developed colt that will do quite a considerable amount of service willingly on the road or farm. But if you expect a three-year-old, or even a four-year-old to work alongside of a 10-year-old, through thick and thin, and not even mind it, you will be greatly disappointed.

Orange County, N. Y.

FROM C. F. WOOLEY.

I like the mother to be of good health, bone, size and disposition, an easy mover, from a sire of good health, size and disposition, and a good, easy mover if not fast. With a good disposition a colt can be broken with much less trouble; if a colt has not that quality it needs much more care to break him and he will be likely to balk, kick or play some other vicious tricks upon slight provocation. With good size and figure if a colt has a good gait and is a free mover, he will bring here from $200 to $500 if fit for a carriage team. If he has not style enough for that, he will pay well for business purposes. I would prefer that the mare should have reasonable work (not excessive) until about two weeks before foaling. By having the advantage of grain feed and exercise the mother and colt will be stronger. When the colt appears let it and its dam run to grass, if the mother doesn't hold her flesh and give plenty of milk. I sometimes feed a little grain. I like to keep the colt growing all the time during the first year. I halter-break it when it is six months old and wean it at from six to eight months of age, and aim to keep it growing nicely by feeding two quarts of oats and bran twice per day. Sometimes for a change I give a feed of corn, and feed hay nights and mornings, and cornstalks at noon, or I vary the feed, according to the supply of each. I always aim that my colts shall have exercise in a lot or out-yard with plenty of light and room every clear day, and box-stall them at night. One should be sure to keep them growing all through the winter by giving them plenty of good feed, but I would rather not give them too much corn, and when they are turned to grass in the following spring they will soon shed their coats and present a pleasing appearance. I value the growth of good colt stock at $50 per year and upward.

Monmouth County, N. J.

FROM J. F. FERGUSON.

I have raised only a few good colts. It has been my practice to purchase sucklings or yearlings in the fall. I never had any good colts from mares I worked. I have raised a few good ones from coupling large Clydesdale two-year-old mares with a line-bred trotter or a Thoroughbred stallion. In this way I have obtained some fine colts which grew up into good, hardy, long-lived horses.

Wean the colt when seven months old; before weaning teach it to eat grain with its dam; feed it one quart of oats and two quarts of bran morning and night until late spring before putting it to pasture. I prefer to put the colt in a box-stall, and in connection with this there should be a yard in which he could run in fair weather in winter. When he is put to pasture look well to it that he has plenty of pure water—one of the main things in a colt pasture.

D. J. Cochran, of Almont, Mich., is the most successful colt-raiser of this section, and this is his rule: "Couple two-year-old mares with a Clydesdale horse in June. Keep the colt and dam at pasture as long as there is any pasture. Wean the colt when the dam is on dry feed, having taught the little thing to eat oats, etc., as described above." He stops breeding the mares when he has to work them, as he thinks the teamsters teach the colts to be ill-tempered before they are born, and he believes that their constitution is broken with high feeding also, before they come into the world.

Almont County, Mich.

FROM S. S. MORDEN.

I aim to have my colts foaled as near the first of May as possible, so as to have pasture for both mare and colt at the start. I usually give the mare bran mashes for a week or 10 days after foaling, and then turn her and the colt into a good pasture with abundance of water, and allow them to feed themselves till cold weather comes on in the fall. Then I put them both in the stable and wean the colt by tying it beside the mare, and allowing it to suck but once or twice per day for a week or more, when I remove it to a separate stable and complete the job of weaning. While weaning the colt, I teach it to lead by putting a collar on the mare and tying the colt to it, and then leading the mare around till the colt gives up struggling and follows along quietly. I have found that this method of breaking to lead saves one a good deal of tugging and jerking, and insures against the possibility of the colt getting away altogether, and learning a bad habit.

After taking the colt from the mare I feed it clover hay, if I have it, or the best hay I have if I don't have clover, and a ration of bran and ground oats three times a day for the first winter. The second and third winters I usually substitute straw for hay and increase the bran and grain ration. I prefer a stable with a ground floor for colts, and after they are thoroughly halter-broken I usually et them loose in the stable—sometimes four to six in one stable. I do not attempt to do more than halter-break a colt till it is nearly three years old, when I break it to harness, both single and double, and also to the saddle; and by kind treatment from first to last I have never had any difficulty in making good, true, kind, serviceable horses. I might add that my experience has mostly been with half-bred Percheron horses.

Prince Edward County, Ont., Canada.

FROM J. D. BRUBAKER.

The first and most essential point in raising good horses is to see that when the mare has foaled, the colt has a sufficient quantity of proper nourishment to insure rapid growth. The food should consist mainly of the nourishment afforded by its dam for at least four weeks; then it should be taught to eat some oats which have been previously soaked for at least five hours, being careful not to give it too much; first give about half a pint and increase the quantity as the colt gets older. The colt should run with its dam in the pasture, when it will not require so much feed as oats; but when the mare is required to work, the colt should be put up in the stable, and fed a little oats and a little green cut grass, and it will thrive better, and it will be better for the mare, than if the colt is allowed to follow the plow, harrow or mower, which might injure it; but during the nights it should be turned out with the mare on grass, as a colt needs, the first year of its growth, all the exercise it can get to develop its legs and form and toughen its hoofs, as well as the other parts of its body.

In localities where for the greater part of the year the weather is wet and the soil rather spongy, the hoofs should be pared off at the points in order that the lower and upper muscles of the legs may be properly developed.

The training of a colt is one of the chief things in making a valuable horse. The colt should be taught to lead and drive single when or before it is six months old. For "breaking," "training" ought to be substituted; but if one does not teach a colt how to work, lead and be dutiful while it is a colt, it will certainly need "breaking" later on. Training colts when they are colts enhances their value one-half or more. Feed colts and teach them at the same time, and do it when they are young, and when they grow up they will regard you as their master.

Cheyenne County, Nebraska.

FROM A. B. TUCKER.

It is as impossible to raise a good colt from poor parents as it is to raise a good crop of grain from poor seed and a worn-out piece of land. In the first place, one should know what he is breeding for. A horse should be bred solely with a view to the labor he is to perform. The first thing for the breeder to do, therefore, is to decide what he wants to do with the horse. Let us suppose that he is to be used as a farm horse; for in these days it is poor business for the average farmer to undertake to raise trotters. In this case, I would recommend any of the draft breeds, as the Clyde, Norman-Percheron, Shire, etc. There are good and poor horses belonging to all the breeds. To raise a good colt both parents should be selected with reference to their individual points of excellence. For ordinary use a mare to breed from should be short-legged, with a deep and roomy chest, small head, wide hips and be so built as to indicate a robust animal, and she should have a good disposition. If possible, always avoid raising colts from a mare with a large head and ears, or from a slab-sided, long-legged animal, or from animals that have diseases such as ringbone, spavin, etc., or from animals with a bad disposition. In case I had such animals and wished to raise colts, I would dispose of them even at a sacrifice, and procure others better adapted to the use I intended to put them to; for in horses, as in other things, "like produces like," or, in other words, the offspring will inherit the general traits or a mixture of the qualities of both parents. We should therefore try to get the best breeding stock that can be procured. There is no profit in raising inferior horses, for it costs no more to feed, shelter and care for good horses than for poor stock, and after one has cared for a colt for two to four years, he likes to have something to be proud of, instead of being disappointed, as he would be, in nine cases out of 10, should he breed from inferior stock.

As to the care of a colt, my mode of treatment is about as follows: After the colt is a week or two old, I generally use the mare at ordinary farm work, taking care not to overwork or over-heat her. The colt is generally left at the barn in a large box-stall, made so tight that the little thing cannot get fast or hurt itself. The mare is fed liberally with all the hay she can eat, and also gets about six quarts of oats at a feed three times a day, except when she is not at work; then she is turned into the pasture. As soon as the colt can be induced to eat it gets all the oats it will eat, and when the mare is out at work I cut an armful of green grass and put it where the colt can get it. I also set a pail of water so that it can always have plenty to eat and drink, and I find that by so doing the colt will soon learn to eat and drink, and will scarcely mind the absence of its dam. The colt is generally allowed to run with the mare until it is from five to six months old, when it is weaned, after which it receives about the same care and feed as before.

During the first winter the colt should have a good warm stable, and plenty of good hay, and two or three quarts of oats twice a day. A couple of ears of corn at each feed also would not go amiss. A handful of oil-meal in its feed, two or three times a week, is also beneficial. Should the colt be inclined to be troubled with worms, a tablespoonful of salt and wood ashes, equal quantities, mixed, and given in its feed twice a week, will keep it in a healthy condition, and even though it may have no worms, the dose will be good for it.

I can give no set of rules for feeding and caring for a colt, that will work well in all cases, for some colts should receive treatment entirely different from that best for others. The great point to be always kept in mind is to get the greatest amount of growth on the animal the first year. I do not say that it ought to be kept "hog-fat;" but it should be kept growing. The grand results are obtained from regularity in feeding, with grain enough to keep the animal growing continually; for a colt that is stunted the first year of its growth will never make the horse that it would have been with proper care.

While speaking of feed and care, we should not forget to give our colt plenty of pure water to drink, and in winter it should not be compelled to drink ice-water, and then stand and shiver for half an hour. But perhaps all farmers have not got their barns as handy as I have. My stable will scarcely ever freeze even in the most severe weather, and my watering trough is right in the barn, and I find it a pleasure instead of a task to take care of my horses in cold weather. Then again, we should give the colt plenty of exercise in the open air. He should be turned out into a lot every day except when it is stormy or bad weather outside, for exercise is essential for the development of the muscles and the general health of the animal. As to the mode of training and handling: When the colt is a week or two old I train him to the halter. Generally two or three lessons will be sufficient, and if it has been done with care and kindness, he will never forget it. From this time on he is handled more or less every day. He soon learns that he has nothing to fear and will come when he is called. A colt should always be treated with kindness, and should never be plagued or tormented, as doing so produces a bad disposition. When a colt is a year old, I generally train him to the use of the bridle, and also to be ridden, and when he is two years old he is trained to be driven, both single and double. All this training goes on step by step, care and kindness being exercised. The whip is an instrument I have very little use for. I haven't a horse or colt that would know what it was for, and were I to show them, they would look at it, and smell at it, and want to taste it to learn if it was good to eat. My neighbors ask me how I manage when I want to drive my steady farm team on the road without a whip to touch them up, and I tell them my horses seem to understand what is required of them and will step off at a lively pace, and instead of my having to "push" on the lines, or touch them up with a whip, I have to hold them back to steady them, or they would go so fast as to overheat and hurt themselves.

Some men think that they will have a picnic or a smash-up when they undertake to break in a colt; but with kind and gentle treatment such as I give mine, they would have nothing to fear. Last season I put in a two-year-old colt to work and the third time it was hitched up, a 12-year-old boy hitched it to my buggy without the assistance of any one. I have never yet raised a colt that after it was a year old, I could not take from the pasture and ride without a bridle or even a halter. Indeed the young things would step around among the other horses, and hold up their heads as though they were proud of the honor of being ridden. This I attribute to kindness on my part, for I consider it no harder when handling them, to speak a kind word, and pat them on the neck, than it would be to give them a kick, and shout at the top of my voice: "Get away there!" Then again, I maintain that a man who has no love for a horse could never raise a good colt, for he would neglect to care for it, and should he undertake to "break it," he would no doubt spoil what might have been a good horse, for his idea of training a colt is, first of all, to let it know what a whip is for, and its second lesson is a continuation of the first, and the third and fourth are repetitions of the others until the colt knows nothing except the whip.

But, to condense my method in the smallest space I would say: Select good, sound and gentle horses to breed from; feed liberally and treat your colts with kindness; for the saying is no more true in the human family, than in the animal, that "love is the cause of love,"

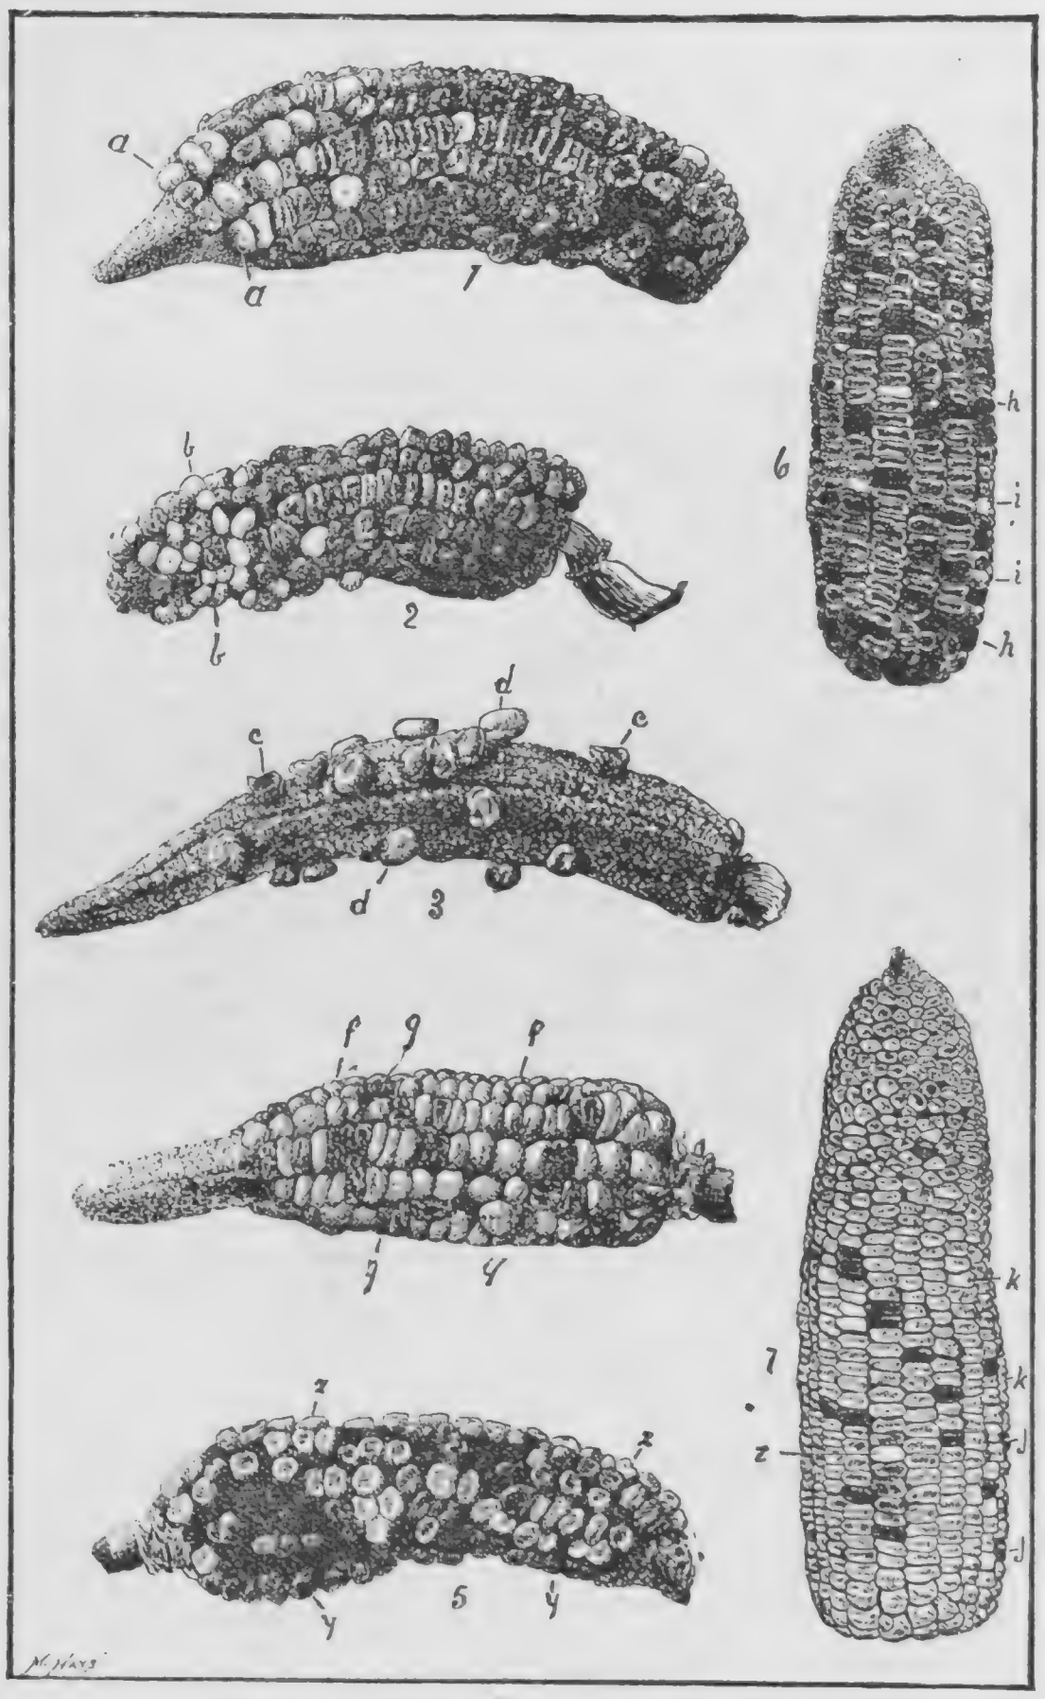
Jones County, Iowa.

FROM H. A. WHITTEMORE.

Before taking the colt from the dam for the purpose of weaning him, prepare a box-stall with a ground floor and a manger which he can easily reach, being neither too high nor too low, with a feed-box for grain. Take him at once from the mother and having previously prepared a feed of fine, well-cured hay, place him in his stable away from the smell or sound of any horse. Give his feed at regular intervals. In addition to the hay give him some roller-process wheat bran. Always scald this with boiling water and after it has cooled feed about one quart at a time twice a day. From the first handle him with gentleness but firmness, and continue until he knows you are his friend. Use the card and brush every day. Water regularly but never give enough to chill him. If you have it you will find much benefit in feeding sweet milk every day, and this you may continue even until he is two or three years old or older. Be sure the feed is sufficiently liberal to keep him growing. Under no circumstances allow him to become stunted, or even cloyed. Always see that his appetite is good and natural. Keep salt where he can always have access to it, for I find it a great promoter of health. Through the weaning process increase his feed by adding a small quantity of clean oats, until he gets at least two quarts a day of oats and bran—always scalded. Let the handling be with that kindness that inspires confidence, but always be the master. If possible give a few potatoes or carrots twice a week; these seem to keep the bowels in a healthy condition.

To halter-break, begin by holding the colt and afterwards tying him for a short time and increase the period until you could leave him in safety for any length of time.

To handle a colt successfully one must be self-possessed and determined. After one has learned the animal's disposition, then kindness should be his rule, but he should punish wrong as well as reward right. Take all gearing or halter off and with a whip begin the lessons in obedience. Tap him gently and speak firmly to him and when he obeys, give him a bit of an apple, a lump of sugar or something he likes, to reward his obedience. If you have made a good point leave him to rest. Next time commence at the place where you left off, but soon try to make him repeat his old tricks, and make these the basis on which to build up success. Whenever you go to his stable, meet him with something to attract his attention, and by doing this you will soon teach him to know his name and come to you.



CROSS-FERTILIZED CORN. Fig. 185.

Then see that he is ready to do for you what you taught yesterday, if he is, then add another lesson.

If you desire a substantial growth and good development you must combine both warmth and comfort with feed. The stable should be free from all direct or cool draughts, and the temperature should be as nearly uniform as possible—never going down to the freezing point. Daily exercise is essential; but if he is left loose in a box-stall or in a yard he will of necessity get considerable; still this is not like that in the open air. You may commence at a very early age to use the bit and lines if you desire; but I am partial to "whip training." I always know I have the complete confidence of my colt; then I take some simple thing, and having made a success of it, leave him, never working him any considerable length of time at first. As one advances, the lessons may be longer. 'Tis an easy matter to teach a colt to turn around, to back, etc., with the whip. You may begin early to teach him to lie down and many little tricks—and certainly if he is of an intelligent nature he will soon commit them to memory and before you are aware of it you have a trick colt.

One of the greatest stimulants to a rapid, healthy growth is regularity in feeding enough to keep up the animal heat and supply Nature's demands; but one should never overload the stomach. Sufficient fresh water is also indespensable, and then thorough grooming. Currying and brushing should never be neglected for one day. One may object to the labor; but if two colts are fed exactly alike, and one goes without the grooming, while the other is regularly groomed, the latter shows an improvement of more than 10 per cent. over the other and the difference between the beauty of the one and the shabby looks of the other will repay all trouble.

Chautauqua County, N. Y.

THOROUGHBRED STALLION TRUEFIT.

Our picture of this animal, see Fig. 184, is reengraved from The London Live Stock Journal. He is an excellent type of a breed of horses that have brought fame and fortune to English breeders. Truefit is now nine years old and has won many battles on the track. He is now used in the Stud of Mr. W. Burdett-Coutts where he gives promise of great success as a sire.

Field Crops.

CROSS-FERTILIZING CORN.

In the last bulletin issued by the Minnesota Experiment Station, Mr. Hays, the assistant in agriculture, gives the result of some experiments on corn. After giving an idea of the possible value of new varieties of corn, he describes the botanical characteristics of the corn flower. This is a subject the R. N.-Y. has had much to say about. The chief point of interest in Mr. Hayes's article is the excellent illustration of the results of his crossing. We give this picture at Fig. 185. The agricultural department at the station was testing about 50 different varieties of corn for ensilage, so that it was possible to secure a wide range for the experiment in crossing. About 100 sets were covered with bags a few days before the silks appeared. Pollen from selected stalks was dusted upon the silks after these had reached the proper stage. The bags were then adjusted and left until all danger of other pollen entering had passed. Cloth bags were thought to be better than those made of paper. Many of the ears that were covered by bags showed signs of being crossed by third varieties. Probably the pollen was mixed before it was applied.

In the picture, Figure 185, Nos. 1, 2, 3, 4 and 5 were covered with bags, while 6 and 7 were allowed to become fertilized in the natural way. Number 1 represents an ear grown upon a stalk of Mammoth Sweet Corn. It was cross-fertilized with pollen from a stalk of large yellow dent corn from seed grown in Australia, formerly taken there from Illinois. The kernels shown to be of light color (*a*, *a*,) are light yellow and as smooth as grains of flint corn. There are only 15 of these grains on the ear, and only one or two show clearly the dent form. These grains vary in color from nearly the deep yellow of the male parent to the light straw color of the female. A few kernels show that Black Mexican pollen from the adjoining plot reached the silks of this ear. All other grains on the ear appear like the grains of Mammoth Sweet Corn.

Number 2 is a cross between a large white dent, White Giant Normandy, and Crosby's Early Sweet. The kernels figured light colored are pure white, nearly as smooth as grains of flint corn, only showing a slight folding of the outer covering, and are hardly as large as the other kernels on the ear, all of which appear like grains of pure Triumph Sweet Corn (*b*.)

Number 3 was produced on a stalk of Triumph Sweet, white, and was cross-fertilized by Smedley Yellow Dent. Nine of the 22 kernels on this ear appear to be unmixed kernels of sweet corn, (*c*, *c*,) while the other 13 (*d*, *d*,) all show signs of the cross. Some of these are nearly smooth, but most of them are more or less wrinkled.

Number 4 grew on a stalk of Crosby's Early Sweet, white, and was fertilized by pollen from a flint variety, Squaw Corn. Two-thirds of the kernels (*f*, *f*,) are light-colored, only slightly dented, and appear much more like flint than like sweet corn. The other one-third (*g*, *g*,) are wrinkled like kernels of sweet corn, with no gradation between the two.

Number 5 represents an ear which grew on a stalk of Mammoth Sweet Corn, white, and the grains were artificially fertilized with pollen from Black Mexican Sweet. Some kernels (*x*, *x*,) on this ear are as light in color as those on ears of unmixed Mammoth Sweet Corn, others (*y*, *y*,) are nearly or quite as dark as any on ears of unmixed Black Mexican Sweet, and there are all gradations of color between these two extremes.

Number 6 grew on a stalk of Long's Early, No. 45, which stood but a few yards from the plot of Black Mexican, and was left uncovered. About one-third of the grains (*h*, *h*,) show the Black Mexican cross in all shades of the mixture of the two colors. The other two-thirds show no Black Mexican cross, but a few nearly white grains (*i*, *i*,) indicate that pollen from another white variety had some influence.

Number 7 was also produced by a stalk of Long's Early and was also uncovered. Besides various grains (*j*, *j*,) showing the Black Mexican cross and others showing a cross with a whiter variety of sweet corn, there is a grain at *z*, which is a typical yellow dent grain and seems to have been produced by pollen of a yellow dent variety at least 10 rods to the eastward. It is proposed to continue these experiments at "breeding corn," and farmers in various parts of Minnesota are requested to send to the station ears of any varieties that are considered particularly well adapted to their parts of the State.

BRITISH DAIRY ASSOCIATION

PROFESSOR J. P. SHELDON.

A visit to the homes of the Galloway and Ayrshire; Cheddar cheese-making; its adaptability to various soils, climates and countries; its great extension in Great Britain; cheese exclusively a "dairy" product; crop rotation in a Scotch dairy district; the Ayrshire the prime favorite in her original home; the best cow for cheese-making; excursions of the British dairy farmers; their advantages.

The British Dairy Farmers' Excursion and Conference, which is now an annual and most interesting feature in the transactions of the association, was this year laid in the Southwestern counties of Scotland,—the classic land of Burns, the home of the Ayrshire cow! This corner of "bonnie Scotland" is often spoken of as Galloway, just as one would speak of the north of Ireland as "Ulster," and of your Northeastern States as "New England;" but in reference to Galloway the name does not indicate a province composed of a number of counties, as is the case in Ireland. Here, indeed, it is that we find, especially in the counties of Dumfries and Kirkcutbright, the Galloway polled cattle in all their sable glory, the home of the Ayrshire being chiefly in the counties of Ayr and Wigton; and here it is that we see as good a system of arable dairy farming, and of Cheddar cheese-making as can be found anywhere in Great Britain.

In this part of Scotland it was that the late Joseph Harding of Somersetshire, the apostle of modern Cheddar cheese-making, implanted the system which, more than any other, has proved its adaptability to various soils, climates, and countries, viz., the Cheddar system. Mr. Harding was employed to introduce into this essentially cheese-producing district the system and method which had already attracted so much attention, and right well he did his duty. Addressing an audience in Ayrshire, in 1854, he said—speaking of different pastures, systems of farming and climates—"I will take the milk from any of them, and make the same cheese anywhere. Cheese is not made in the field, or in the byre, or even in the cow—it is made in the dairy." In this cosmopolitan adaptiveness, then, of the Cheddar system of cheese-making, Harding was a firm believer at and before the time when Jesse Williams started the first cheese factory in America.

There are many large dairy farms in Ayr and Wigton, and the land is to a great extent under arable cultivation. The Ayrshire is the universal cow in these counties, and it is not at all uncommon to find herds of 50 up to 200. The soil for the most part is a rather light, friable loam, and it is managed, generally speaking, on a six-course rotation, viz: one year oats, second year green crops, third year oats, followed by three years' grass. With the second oat crop the grasses are sown, consisting of Rye Grass, Cocksfoot, Timothy and clovers, and they come into pasture the following spring. The land is well farmed, and weeds of all kinds find no quarter there. These temporary pastures, in fact, are cleaner than permanent ones, for all weeds are eradicated at all events once in six years, and fresh grass seeds are sown.

The Cheddar system has completely supplanted the old Dunlop mode of cheese-making, and many of the farm dairies are little factories, equipped with every convenience, and scrupulously clean. The cows on many farms are let to a "bower," who makes the cheese; the farmer receives, in payment for the season's milk, generally about 480 pounds of cheese per cow, the surplus over and above this quantity being the bower's pay and profit. A so-called "hundredweight" of cheese is 120 pounds in this country generally, in Cheshire it is 121 pounds. It speaks well for the milk-yielding capacity of the Ayrshire cow in her own habitat, that, over and above four cwts. of cheese in the season, she will yield sufficient to pay the cost of making the season's cheese, and a profit besides; for to do this, the average yield of milk per cow cannot be far short of 600 gallons. We may admit, indeed, the Ayrshire cow to be the best cow in existence for cheese-making purposes; and, as a matter of certainty, she will—size and weight of cow being taken into consideration—yield more milk than the cow of any other family or breed in the bovine race.

The conference opened on Tuesday, June 11, in the Town Hall at Stranvaer, under the presidency of the Earl of Galloway. First there were an address of welcome and a response thereto; these were followed by a paper on "The best methods of feeding cattle for dairy purposes," and an able discussion. Next came a lunch, and afterwards a drive to the Dunrage Creamery, to the farm of Mr. Frederick, whose Cheddar cheese won the first prize at last year's London Dairy Show, and to the splendid pleasure grounds of the Earl of Stair, at Castle Kennedy. On each of the three following days a paper was read, followed by a discussion, and high-class farms were visited. Two of the four days were spent in Wigtonshire, and the other two in Ayrshire, and the conference was well attended throughout. These excursions into first one and then another of the dairy districts of the British Islands, are doing considerable good amongst dairy farmers. They rouse up our sleepy ones, and set people on to think out the matter and to talk about it. The object is to create a new and active interest in dairy farming as a business, and in cheese-making and butter-making as arts closely allied. Unless this can be done, British dairying will not reach the high position which our soil and climate place within its reach. *But it is being done*, and there is already an advance all along the line, wherever the association has paid a visit. But the work of dairy education is perennial and permanent. Many years will elapse before all the dairying districts have been visited, and then it will be time to visit them over again. And again, new generations are constantly springing up; and these need teaching, like those which have gone before.

Sheen, Ashbourne, England.

DAIRY NOTES FROM A DAIRY RANCH.

CARE OF CREAM.

Why butter doesn't come, and how to make it do so; feeds for quantity and quality of products; treatment of cream before churning; "ripening;" cream from different milkings; temperature of cream all-important in churning; how to regulate it; trouble from faulty thermometer; frozen cream; cream from farrow cows; thick and thin cream for churning.

"Why does not my butter come?" is a question one often sees asked in the agricultural papers during the winter season. Ever since I was strong enough to help bring the butter from the cream in the old-fashioned dash churn, I have had more or less to do with butter-making, and for the last 11 years have superintended the churning of from 1,000 to 1,500 pounds of butter yearly; yet never do I remember a churning of cream that did not eventually come to butter. Now and then a churning has been aggravatingly slow in showing the golden grains; but at last they came and with them a hard-earned experience that helped us to guard against a similar trial of patience and strength in the future.

To begin with, let us presume that the cows are well cared for and fed on a variety of grain, hay and possibly roots, that they get salt and water regularly. All the profit the cow can be expected to yield to her keeper, in milk and butter, comes from the nutriment she can be induced to take over and above what is needed to keep her alive.

This the dairyman understands and he acts accordingly. He also understands that certain articles induce a flow of milk without much improving the quality, and that other articles add to the richness of the milk and improve the quality of the butter. Among the first might be mentioned potatoes and bran, and in the latter class corn-meal and oats. After the milk has been strained and set with due regard to cleanliness, the gathering and treatment of the cream before being put into the churn, will decide how quickly the butter shall come, and what its quality shall be.

Perhaps no cream will churn as quickly and thoroughly as that gathered from shallow pans where the milk has been heated until wrinkles began to show on the top.

When all butter-makers used common milk-pans in which to raise their cream, we heard very little about "ripening"—in fact, the cream ripened as it gathered on the surface, and the one thing to guard against was letting it become over-ripe, thereby injuring the quality of the butter. Sweet cream requires more churning than sour cream; therefore if the cream for one churning is gathered at different times, it is necessary to stir the mass every time a new installment is added, and in case of cream gathered from the deep cans, 12 hours should pass after the last sweet cream is added, to give it time to ripen, else just that amount of cream will go out with the buttermilk, unchurned.

The great thing in successful churning is to have the cream at just the right temperature when commencing—60 degrees in summer; 65 degrees in winter. Should you begin to churn while it is too cool it will foam and swell. When this occurs stop churning at once, and make a test with the thermometer. Cream needs close watching for the first 15 minutes of churning. If it is not right, every turn of the crank increases the difficulty. If it is too cool, it will be another case of "wouldn't-come." If agitation is persisted in; if the cream is too warm, before you have thought of the thing you find a frothy, white, inferior article of butter floating in the churn. Of course, the cream was at the right temperature when you commenced churning, but something has happened. It is a very cold day, and that heavy churn has acted like a block of ice upon the cream. You rinsed it with hot water, but that didn't take half of the frost out of it; you make a test and find the cream several degrees cooler than you expected. Or it is a very sultry morning and your thermometer tells you the temperature of the cream is going up. In this case put fine pieces of clean ice in the cream until it is sufficiently cool. In the other case warm the cream with boiling-hot water.

Hold the dipper of water in the left hand, pour it in slowly and move the dash meantime with the right hand. Use boiling water because it does no harm, and because there is less danger of getting the churn too full. If the churn does become too full, it is a saving of time to divide the cream and make two churnings.

It is an exceedingly tedious piece of work to accomplish a churning when the dash cannot come out of the cream. But suppose the cream has been ripened to the right degree of acidity, the temperature is all right, and still the butter refuses "to come?" There is a chance the fault may be in the thermometer. I once spent hours of hard work trying to bring butter at 65 degrees till, in a fit of desperation, I raised the cream to 70 degrees and soon had as nice butter as could be desired. The trouble was due to a faulty thermometer, but the churning worked well enough after I had learned where the difficulty lay. While ripening cream, keep it as near the temperature desired for churning as possible.

Some think butter cannot be made of cream that has been frozen. One winter when I had only one pan of milk to set night and morning, I scalded it and set it in a summer milk-

room where it sometimes froze before the next morning. Day by day as I gathered the cream, I put it in a stone churn where it froze and remained frozen until I had enough for a respectable churning. Then it was set in a tub of hot water by the kitchen fire, and stirred occasionally until it came to 65 degrees. Then it was colored, and churned as readily and satisfactorily as in the summer time. Thin cream churns more thoroughly than thick cream, so it is advisable to put a little milk or water into very thick cream. You may be sure by the richness of the butter-milk that your cream did not yield a fair amount of butter; yet you can very seldom prove it by churning the butter-milk. Intense cold has the effect of separating the cream from the butter-milk in such a case. One frigid morning I found a large vessel of butter-milk from the churning of the day before covered several inches deep with grainy cream. I gathered and churned it, but got only about half the butter from it that I thought the churning had failed to yield, and this was of interior quality. Cream that is a little sweet, but of the right temperature, will come without growing thick.. Sour cream usually thickens in coming. The length of time necessary to churn depends upon the quantity of cream somewhat. If the butter comes very quickly there is danger that the cream may not be thoroughly churned, or that it was too warm; when all hopes of making a fine article must be abandoned, for in that case the firmness of grain can never be recovered. It is claimed that milk from a farrow cow will not churn; but farrow cows are not profitable so the wide-awake dairyman soon hands them over to the butcher and fills their place with something that will pay for keeping.

BETTER COWS AND HOW TO GET THEM.

J. W. NEWTON.

Beef stock being no longer profitable in the East, more attention must be given to dairy cows; dogs the great hinderance to profit in sheep; 300 pounds of butter per cow per annum the standard; this to be obtained by selection and grading up the herd; how to do so economically; a good dairy bull indispensable.

THE farmers of the East are confronted with a new problem. In the past it paid to fatten beeves. Steers, oxen and other stock could be fed and sold at a good profit. A man could raise a yoke of steers, work them enough to nearly or quite pay for their keeping after they were old enough to work, and then turn them over to the drover for a good round sum. Now men who have oxen to dis pose of feel discouraged. Three cents and a-half or less per pound for them will cause farmers to keep fewer oxen and steers.

But some kind of stock must be kept, at least by the majority of farmers. Some can grow crops with commercial fertilizers and sell what they raise. Many are raising more horses. I think mutton sheep, and especially early lambs would pay as well as any stock, always provided the cruel dogs can be kept away. But the great mass of Eastern farmers are dairymen from necessity or choice.

Here, too, conditions are changed. Those who supply cities with milk are not troubled by Western competition; but those who make butter must compete with the West, with oleo, and with each other. The man whose cows average only 100 to 150 pounds of butter per annum, will learn that his kind of farming does not pay. He will work hard to cut grass, to plow and plant, and sow and reap, and will not earn as much as he could by working out. The progressive farmer has his eye on 300 pounds of butter per cow. He may not have yet reached that mark; some have, but our hopeful farmer is working up to it. Suppose he makes 250 pounds per cow and gets say, 25 cents per pound, he will receive from each cow in butter and the by-products—skim-milk, etc.—about $70. "Dont-pay" farming will get from $30 to $40 per cow. The good cow does not eat much more than the poor cow, often not as much home-grown feed.

It is evident that good cows are going to have a great deal to do with the prosperity of Eastern farmers. The question is: How are farmers to get them? Jersey bull calves were advertised in the RURAL awhile ago at $100 each. The advertisers said that farmers could not afford to buy cheaper ones. That may be true, but it is also true that a great many farmers cannot afford such bulls.

Thousands of farmers could not sell their farms, stock and tools for more than $2,000 or $3,000; some would have to sell for less, and yet they make a living, often a good living. For such men to invest $100 in a bull calf would be very unwise. The calf might die, and the farmer would feel the loss for years. I do not know about other butter breeds, but Jersey bull calves eligible to registry can be got for $25.

But many farmers would think this a great price for a calf, and such can get calves out of registered bulls and from thoroughbred or high-grade cows for lower figures. Men that have large herds or even small ones, are often willing to sell really good calves at very low prices. It all depends on the demand and other circumstances. But there are Jerseys and Jerseys. Some are very poor, and a man who wants to get good cows must take care lest he buy too cheap.

Often it is better to take one's best cows to a good bull if one is within reach. A number of farmers, or a grange, or the patrons of a creamery residing in a neighborhood, could unite to get a bull to improve their cows. It is well to get thoroughbred heifers, if one can do so; but if a farmer doesn't understand feeding and caring for thoroughbred stock, he had better work into better cows by degrees.

But by all means, if you are going to keep cows for butter, get butter cows. To do this is to take a long step towards making the farm pay. Dont spend your time and strength on poor stock, and remember that the bull is half the herd, that like begets like, and that blood will tell. Never use a scrub or common bull if you are going to keep the calves. When a farmer keeps good cows, people will soon find it out, and if he has a cow to sell he can get a better price than the owners of ordinary stock can get. There are a host of reasons why farmers should steadily improve their stock, and yet how few are doing it!

Lamoille County, Vt.

Miscellaneous.

CORRESPONDENTS' VIEWS.

RULES FOR RENOVATING A WORN-OUT FARM.—Never let the stock run over the farm when the land is wet and soft. Never plow or till the land when it is too wet. Return as much fertilizer to the ground as you remove from it each year. Clover your land at least once in three years. Never haul the clover straw off the field. Leave it on either as a protection or mulch. Six years ago I bought a farm so poor that my neighbors said it would not produce seed enough to plant it again. By observing the above rules, it is now producing as good crops as are grown by my neighbors. I used nothing but stable and barnyard manures. Good farming pays. If you treat Mother Earth well, she will treat you well in return. S. H. E.

Medina County, Ohio.

THE FARMER NEITHER A DULLARD NOR BOOR.—It is a great mistake to attribute want of mental culture to the American farmer. He must know more or less of most of the practical sciences in order to take care of his animals, his crops, his machines, to forecast the weather for his seeding and his harvesting, and the prospects of demand for his marketing. He not only reads the papers, but he has undisturbed time to ponder on what seems important, to digest it, and form well considered conclusions. Only his tongue is not so fluent, or flippant, his thoughts not so nimble, his principles not so adaptable, his hands and dress not so free from dust and rents, and his enduring fiber not so supple as among the sedentary room-imprisoned, over-sheltered denizens of the town. CUMBERLAND VALLEY NOTES.

A "happy valley;" a beautiful and prosperous region; thrift; good, convenient markets; crops this year; rotation of crops; prejudice against "fertilizers;" profitable orcharding; extensive use of traction engines, depreciation in price of land; pleasant homes; an abundant water supply; the great Grange picnic; recent floods.

Is there a more beautiful and fertile valley in the world than that which is known as the Cumberland Valley, Maryland, extending from the Blue Mountains on the southwest to the Susquehanna on the north? The land is fertile and well cultivated; it is evenly divided into regularly shaped fields, well fenced; the barns are large and commodious and the houses are comfortable and well cared for. The people are, as a rule, church-going, virtuous, thrifty and apparently as happy and contented as possible. Altogether it is a model agricultural section. One of the reasons why the farmers of the valley are thrifty is because they find an excellent home market for all their surplus products (except wheat and rye and, sometimes, hay) in the local villages, thus saving cost of packages, freights, commissions and the numerous other charges which eat up the profits of farmers less fortunately situated. The prices, too, are usually based upon the quotations in the R. N.-Y. or from some similar sources and are often quite as high as those obtained in the large cities. The markets are never glutted and prices are therefore comparatively uniform.

The wheat crop in the northern part of the valley is not quite up to the average owing to the heavy rains. On the lower meadows the grain is badly lodged and cannot be harvested without considerable loss. In the lower valley the crop is about up to the usual average, and will be harvested without material loss. Corn is backward and the acreage is comparatively small. The wet weather caused it to come up very unevenly. Potatoes, too, have come up unevenly and will hardly be an average crop. No regular rotation of crops is practiced. Each farmer has a system of his own. As a rule, the rotation is a matter of prejudice or convenience. It is not practiced scientifically. Clover is frequently plowed under. Many of the farmers are strongly prejudiced against commercial fertilizers. They say that they value their land too highly to ruin it by stimulants. As a rule, they use special fertilizers, chiefly the lower grades of wheat fertilizers. They are not disposed to pay more than $20 per ton for any they may purchase.

Hundreds of acres of the lower valley, on the northern slope of the Blue Mountains, have been set in peach trees. The orchards which are in bearing have proven very profitable and almost all the farmers have set orchards. One orchard is said to have netted its owner over $40,000 last year. Major Alvord, of the Maryland Agricultural Society, thinks that western Maryland will soon become a great peach-growing section. He is spending considerable time among these orchards and his report concerning them will doubtless be of great interest and value. The use of traction engines is on the increase. The roads and bridges are being made to accommodate the engines, and it is found that for many purposes they are cheaper than horse power. It is estimated that there are several thousand traction engines in use in central Pennsylvania. As a matter of course, they work best on hard, level roads, but they will pass over any ordinary obstruction or climb quite steep hills. Traction engines have superseded the old-fashioned portable engines almost entirely. It is about as easy for a team to do the thrashing as to transfer the engine. It is very much easier and more economical to utilize the engine to move itself and the thrasher from place to place. The sale of traction engines is rapidly increasing. One of the reasons why steam power is becoming popular is the high price and scarcity of good work horses; another reason is the scarcity of good farm help. An engine of, say, 10-horse power will do an immense amount of work. Such an engine consumes from 500 to 700 pounds of coal per day, costing, say, $2.

Notwithstanding the apparent prosperity of the farmers of the valley, the value or at least the selling price of the farm lands is constantly depreciating. A conservative estimate places the depreciation at fully 33⅓ per cent. within the last few years. The worst of it is that the depreciation still goes on. At forced sales there are very few buyers and only nominal prices are obtained. Mortgagees usually buy in the places which are sold under foreclosure. When will farm lands reach a price which will attract buyers who want to follow farming as a business? Until then low prices must prevail. One of the things which make the valley so attractive is the excellent condition of the front yards. In some localities it seems to be the fashion to shut up the front of the house and live in the kitchen; it is not so here. Almost every front yard is adorned with a great bunch of hollyhocks, honeysuckles and other ornamental flowers and shrubs. The farm-house without a handsome front yard does not look complete.

The water supply is unsurpassed. On every side there are springs and creeks, the latter being in many cases large enough to run the local grist-mill. The larger towns draw their supply of water from the adjacent mountains.

The Grange picnic to be held at Williams Grove, beginning on August 26, is looked forward to with eager anticipation. It is expected that it will be the largest combined fair and picnic ever held in this country.

The recent floods carried away many bridges and washed the roads very badly in places, but did no very serious damage. Some of the lower meadows were badly washed, but not seriously enough to injure the grass or corn. RAMBLER.

RURAL SPECIAL REPORTS.

California.

ONTARIO San Bernardino County, July 2.—We have been here nearly three years and are delighted with the climate and country. We have a small fruit farm of five acres and are getting along nicely, and my husband's health and that of many other invalids has improved astonishingly. D. L. B.

Canada.

ST. CATHERINES, Lincoln County, Ont.—Wheat, barley, corn, oats, hay, horses, cattle, fruit and vegetables of all kinds, are our cash products. The wheat is sold to millers here; the barley is sold to breweries and exported. All other products are sold here, except fruits, which are mostly exported to Toronto, London, Ottawa and Montreal. Prices are generally good. Last year's crops of apples, potatoes and turnips, yielded poor returns, however. Future prices seem likely to be fair. Some get extra prices by marketing first-class products. During the past 10 years farming has changed to fruit growing, fruits yielding better returns than other farm products. I would suggest the cultivation of fewer acres and better work. S. D. W.

Kansas.

IUKA, Pratt County, June 28.—We have splendid prospects this year for everything. None of the big stories of Kansas production are over-estimated this year—there are many fields of oats that will yield 100 bushels or more per acre. All kinds of fruit are in abundance, and so is everything else.

J. J. M.

New Jersey.

TITUSVILLE, Mercer County, July 15.—Grass is very heavy; not all harvested yet: much of it has been damaged by rain after it had been cut. Wheat about an average; straw generally short and rather thin. Oats a full average crop; nearly ripe. Corn about an average for this time of the year; a good proportion of it needs more tending to. Constant rains have hurt the prospect for a fine crop, as many pieces are weedy, and the stand is not very good. Potato prospect poor. The crop on many pieces came up badly, and as the ground was too wet to work, weeds grew apace and beetles throve disastrously, and, moreover, the potatoes show signs of rot. J. W.

Pennsylvania.

BINGHAM, Potter County, July 8.—It commenced raining on Decoration Day and rained till the night of July 3d. Orchard fruits are all killed and so are small fruits. Oats are a good stand on high land. Grass is good on new seeding. Old meadows are light on account of the freeze. Potatoes are going to be light on account of wet weather. Of corn there is none. Rye is splendid and bids fair to be a large crop. Spring and winter wheat isn't much raised—only on new land. S. S. C.

ANSWERS TO CORRESPONDENTS

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

INCREASING SIZE AND VIGOR OF JERSEYS.

Several Subscribers.—Are breeders taking any steps to improve the size and general constitution of Jersey cattle?

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies.

Ans.— Messrs Miller & Sibley of Franklin, Pa., are reported to be breeding with this special end in view. They write the R. N.-Y. the following account of their methods:

"We can give no formula for breeding large and rugged Jerseys. We have believed from the first in strong constitutions being necessary to the success of any herd. Without constitution as the first requisite all else will fail. With that end in view, we purchased many individuals that would have been rejected by fanciers who were seeking typical lawn cows. The points in Jerseys which prejudice us against individuals are those external evidences of lack of constitution as indicated mainly in thin, mellow skins, or what has been termed paper skins. We object to fine, delicate limbs and small, crumpled, waxy horns. Although our herd is nearly solid-colored, fawns and grays predominating, yet in our opinion color should never be recognized as a point of merit. [Its chief value is as an indication of purity of strain or breed. EDS.] Our practice is to turn our herd out every day in the year for exercise. This rule is not deviated from except in cases of cold sleety winter rains. In the management of bulls our practice has been to put them on a tread-power properly arranged with a governor, and exercise them half an hour each day. This, in our judgment, tends to increase lung capacity and to strengthen bone and sinew, and under this treatment Stoke Pogis 5, now over 10 years old, is as ready and active as a yearling. In all probability the preferable method would be to have paddocks built where the bulls could have constant liberty in half-acre or acre fields. For the last few years to increase size and vigor we have made it a practice never to breed a heifer until she was two years old or upwards. Time enough has not elapsed to determine fully the value of this plan, but such limited observation as we have had convinces us that it is one of the most important factors in breeding for size and constitution. We believe in liberal but not high feeding with as great a variety of forage as can readily be obtained, and with an abundance of light and fresh air in the stables. In winter our stables are never allowed to get warmer than 45 Fahrenheit or colder than from 38 to 40 degrees. We believe our stables are cooler in the winter than the majority of stables from the fact that the ventilators are always open, no matter how cold the outside temperature may be.

FEEDING FOR EGGS.

H. D. T., Phillipsburgh, Mont.—What quantity of Indian corn will fully feed 150 choice White Leghorn cocks and hens for one year, on a grassy range of several acres? If the hens are fully fed on corn, potatoes and pumpkins, and well housed and cared for, how many eggs can be reasonaby expected from them in a year?

ANSWERED BY P. H. JACOBS.

ANS.—Corn is an unsuitable food for laying hens, being deficient in lime, and containing an excess of carbon, which promotes the laying on of fat, which is not favorable to egg-production. If the hens have a range they should be fed no grain at all in summer, but may be allowed eight pounds of chopped lean meat (liver or other rough portions will answer) at night. In winter they should have all the chopped clover hay they can eat, in the morning. About three pounds of hay will answer for 150 hens. The chopped hay is scalded at night, in a tub, a cloth being thrown over the tub, and in the morning a mixture of five pounds of bran and ground oats may be incorporated with it, the mess salted to season, and fed in troughs. At night a pint of wheat may be fed to each dozen hens. Twice a week give a pound of linseed meal for the 150 hens in the clover, and twice a week feed a pound of chopped meat to 20 hens. On such a diet the hens should lay well if kept warm. The object should be to keep the hens at work scratching. Exercise is the best egg-promoter. 2. Corn, potatoes and pumpkins will answer also, provided the clover and meat are added. To produce eggs the hens *must* have nitrogenous food. If cared for, and not over-fed, each hen should lay 10 dozen eggs per annum. Some will lay 140, and some will lay 100 or less. Much depends on individual characteristics, as no two hens are alike in every respect.

Miscellaneous.

C. W. D., Terrell, Texas.—Is the Taylor Blackberry earlier than the Kittatinny?

ANS.—No, it is later than the Kittatinny.

A. H., Archer's Fork, Ohio.—The R. N.-Y. hopes to give a full description of fish ponds and fish culture with good photographic illustrations.

J. C. M., Pleasanton, Cal.—1. Where can I get a corn-husking machine? 2. Is there a self-feeder and band-cutter manufactured for husking bound grain? If so, where?

ANS.—1. The Keystone Manufacturing Co., Sterling, Ill. 2. We do not know of any.

"A Reader," Hagaman's Mills, N. Y.—What is the weed a specimen of which is inclosed?

ANS.—The specimen sent is Echium vulgare—Viper's Bugloss. It is a most pernicious weed. Being a biennial, it can be exterminated by hoed crops.

H. A. S., Rock City Falls, N. Y.—1. What proportion of nitrogen should go with wood ashes for potatoes? What would be the cost? 2. With about 25 loads of manure per acre for wheat, would it pay to put 10 to 12 bushels of wood ashes?

ANS.—1. To every acre use one bag of nitrate of soda or sulphate of ammonia or half of each. Any fertilizer firm will furnish either. The cost will be about $5 per bag. 2. Yes, decidedly, unless the land happens to be already well supplied with potash and phosphoric acid. Our friend should guard against such an application of manure as would be likely to cause the grain to lodge.

W. L. K., Westmoreland County, Pa. 1. What is a good plan for attaching three horses abreast to a wagon so that the tongue will be properly adjusted between two of them? 2. Is there any danger that hay put into the barn green will burn by spontaneous combustion endangering the barn? 3. What does the RURAL think of Buckingham and Prince Edward Counties, Va., as places where a Northern young man with limited means but a liberal education could settle with fair prospects of success?

ANS.—1 On page 158 you will find two excellent devices for three-horse eveners. 2. This was answered last week. 3. We do not know much about the chances in those counties. Unless one has some capital he may be able to do as well at home.

J. W. W., Ont., Canada.—I send the RURAL a bunch of roses cut from a bush of Hybrid Perpetual Moss Roses which always bore white flowers until last summer when they began to sport. Some of the flowers would have from one to two rose-colored petals, in others from one-third to one-half would be of that hue, while in the same cluster some would be of a deep rose color and others pure white. At present there is in one of the clusters of buds one that is larger than the rest and there is absolutely no moss on it. What is the cause?

ANS.—It is no doubt a case of what is called "sporting" for want of a better word. This is very common with roses and some of our finest varieties have been obtained by propagating the sport. It is known that most of our garden roses are the results of crossing or hybridization. Under peculiar conditions it would seem that the blood of some ancestor, previously impotent, becomes potent and asserts its potency in growth. That is the best explanation the R. N.-Y. can give.

DISCUSSION.

"IS CREAM, CREAM?"

"A COOLEY MAN."—In the RURAL'S discussion on the subject: "Is Cream, Cream?" I see that the correspondents don't keep to the main question, with the exception of Prof. Babcock. The question is not whether cream raised in all sorts of apparatus is the same, but it is whether the cream raised in the Cooley is the same, and the man who asked the question, should have put in, "when raised according to the prescribed rules." The density of the cream varies with the temperatures at which it is raised. What Prof. Collier says, that "the art is a good deal ahead of the science," is true. I know that cream from various sorts of milk raised in the Cooley, when run according to rule and the divisions made by the spaces, comes nearer to yielding all the contents of butter fat in it than that raised by any other device. Anybody who has had any experience, knows that it is not practical to make a division by the chemical test, for every chemist of any experience can tell that more butter always comes out of the churn than the chemical test calls for. The chemical test shows only the butter fat, while butter takes the butter fat, water, a small portion of caseine, etc., and the proportion of this part of caseine depends upon the apparatus in which the cream is raised. In all the analyses made lately cream raised in the Cooley has less caseine than that raised in any other apparatus. The object is to exclude from the cream as much caseine as possible, as caseine is what spoils butter.

Prof. Cooke has written an article on the question of a cream-raiser and where its offices end and where the offices of the churn and of the butter-maker begin. This question arose from the fact that the Cooley Creamer in the New Hampshire test got the fat out of the milk cleaner than any other apparatus; but Prof. Whitcher insisted on having the Cooley cream churned before it was ripe, and consequently by Whitcher's own analysis there was about 15 per cent of the fat that went off in the butter-milk in the Cooley, and Whitcher claimed that it was the fault of the Cooley Creamer, while experienced men, like Prof. Cooke and Mr. Philbrick, the Chairman of the Committe at Hanover, claim that it was not the fault of the Cooley but the fault of the manipulator of the cream.

In discussing this question the disputants got mixed, one claiming that Prof. Cooke said that the cream was cream, while one who reads his article can see that he says nothing of the kind. What Prof. Cooke said was that success in handling the cream and getting the greatest amount of butter fat out of it after it had been taken from the milk, depended upon the skill of the manipulator, and not upon the cream-raiser; but the superficial fellows have got it mixed with the idea that one mess of cream will make as much butter as another mess per space, or gauge or gallon. Prof. Cooke was not discussing that matter at all.

R. N.-Y.—This correspondent sends newspaper clippings of articles written by A. W. Cheever and Prof. W. W. Cooke, of Vermont. Prof. Cooke has this to say:

"In the course of our work we have tested cream from several different processes and from the same process under various conditions. All our results have tended to show that after the skimming is done, that is the end of the influence of the skimming device, and that the cream can be churned thoroughly, that is, without much loss of fat in the butter-milk, no matter what the system of creaming was, provided the person in charge handled that cream properly. The cream from each system of skimming will require its own individual treatment to get the best results. And the butter-maker will have to study the conditions and treat each cream according to its needs, and not think because a certain method of mixing, ripening and churning will get the best results from one cream that therefore it should give equally good results on the cream obtained from other systems. It might be added that the system used in obtaining the cream must be properly used and not abused in order that it should not have an effect on the churning qualities of the cream. Milk may be spoiled before the cream is taken from it, and then no method of churning can get good results. I should lay this down as a general principle: The per cent. of fat in the skimmed milk is the result of the system used for obtaining the cream. The per cent. of fat in the buttermilk is a measure of the skill of the butter-maker."

Mr. Cheever thinks Prof. Cooke's "general principle" is correct. Mr. C. says he does not often trust himself to say that he *knows* anything about dairy matters, yet he is prepared to stand by the following:

"I know that when a dairyman changes from one method of creaming to another method there must be changes in the method of churning in order to obtain equal results. I know that cream taken from scalded milk set in small open pans requires very different treatment in the churning room from cream raised on milk poured into deep pails and set in cold water. I know that some cream requires to be thinned with milk or water before it is churned in order to retard the separation and prevent loss of butter fat in the butter-milk, and that other cream requires a ripening process before going into the churn, and also requires a larger churn for the amount of butter obtainable, and that without the ripening and the large churn there will be a loss of butter, and very likely a serious impairment of quality."

Mr. C. also says that an "inch" or a "space" is a measure of the relative quantity of different samples of cream exactly as a "dozen" is the measure of the quantity of different samples of eggs or as a "quart" is the measure of different samples of milk. The space method of measuring cream is not perfect, but it seems as fair and just as any yet devised. Buying and selling eggs by count is not equitable, yet eggs continue to be sold in this way. It is the same rule as that employed by towns, railroad companies and manufacturers in paying even rates for a day's work when everybody knows that work by one man may be worth a good deal more than that by another. The system may not be quite just, but it seems as just as any other could be. Cream sent to a factory should be treated as nearly alike as possible by all the patrons.

This cream question is evidently of vital importance to creamery patrons. This discussion will be continued next week.

SAND FOR BEDDING; KILLING CATERPILLARS.

M. C. A., EGYPT, MAINE.—In the R. N.-Y. of June 29, a quotation is made from Dr. Caldwell, as follows: "Any bed of muck is worth trying, for it may be a small mine of wealth." Less than a year ago I bought a piece of property which had been seeded with grass. It lies flat. Last March it was concluded to use "sand" for the bedding of one of the horses that had been addicted to eating litter of various kinds. I was delighted with the results. The two white stockings of the horse were kept perfectly clean and he did not get soiled like horses bedded on yellow or red sand. The sand was frozen, so I had to be very sparing in its use and all sorts of schemes were indulged in to get the requisite amount of bedding. In order to get the frost out quickly we put a large, shallow panful in the oven. The odor of sulphurous gas was so pungent that I thought I was poisoned by the fumes, and had recourse to aconitum, the antidote in such cases in homœopathic practice. The silver on the table in the room was discolored. A large pan of water standing on top of the stove formed enough sulphuretted hydrogen to blacken two silver spoons which lay on the bottom of the pan. So very black were they that it required the best silver polish to remove the discoloration. This goes to prove that the sand must have contained alluvial deposits largely charged with sulphur. The roads were in such a horrible condition after the snow, that it was impossible to get sand up, and the bedding that had been used was washed and the water thrown on the grass. Now the places where the water was thrown are very luxuriant with a dark-green grass; while manure, liquid and solid, fails to bring out the vivid green that the sand washings do. Would it pay to haul it over bad roads, as a top-dressing for agricultural purposes? Phosphates that cost $2 a hundredweight, have been thickly applied to the grass by the side of the sand-washings, and I cannot see any difference in the sward, either as to thickness or color, while the horses will go straight up to graze on the grass on the sand-washing spots, of which there are several, so that the grass there must be sweet. I have tried liquid hen manure, also stable manure, from horses and cows, and cannot see enough difference to make one remark a change on this run-down land, while every one will exclaim at the "greenness" of the different varieties of grass grown on the land on which the sand-washings were thrown.

I have not seen in the RURAL any account of the ingenious method resorted to by a Franklin man for killing Tent-caterpillars. On fruit trees, especially apples, it is said to be very effective by all who have tried it. He loads his gun with powder alone, holds the muzzle about two feet from the nest, and the concussion and effects of the powder instantly kill all the worms, and destroy the nest, etc. The limb of the tree is uninjured. The torture of the old methods which are less effective in ridding the trees of these pests, is dispensed with. I think such a quick and easy death to these very annoying insects, should commend itself to the Daughters of the King. For nests high up on branches not otherwise accessible, he ties his gun to a pole or a piece of wood, and discharges it by means of a string to the trigger. The method is not very expensive; as a light charge of powder and common caps are used. The cost is about half a cent a discharge.

R. N.-Y.—Our correspondent should send a sample of this sand to Director W. H. Jordan, of the National Experiment Station at Orono, Maine, for analysis.

DOES INFECUNDITY OF THE STRAWBERRY SEED AFFECT THE BERRY?

M. A. BECKWITH, AGRICULTURAL EXPERIMENT STATION, NEWARK, DEL.—Mr. Proctor's article on this subject on Page 385, is evidently based entirely upon theory. Possibly some of the so-called imperfect-flowering varieties of strawberries will, under favorable circumstances, produce a sufficient number of stamens to fertilize the ovules and insure a full crop of fruit; but such instances are rare. It is a well known fact among strawberry growers that among the pistillate varieties every third or fourth row must be planted with a variety which produces an abundance of pollen; otherwise the small amount of fruit that is produced will be very knurly and imperfect. I have spent considerable time among the fruit-growers of this State and the above opinion has been corroborated by many of our largest growers of strawberries, who have practically demonstrated its truth. During the past four years I have artificially pollenized a large number of the blossoms of different varieties of strawberries as well as other fruits. In no instance where the blossoms were protected so that pollen could not reach the pistils were any fruits formed. While connected with the New York Agricultural Experiment Station at Geneva, N. Y., I conducted several experiments to determine whether the pistillate flowers of the strawberry would produce fruit without the aid of pollen from other blossoms. The flowers in every case were protected by covering them with thin paper or with cloth, so that pollen could not reach the pistils. In one instance a number of plants of the Crescent Strawberry were grown in

pots in the greenhouse and were protected from insects by means of fine netting. All blossoms artificially fertilized produced fruit, while none of the others gave any appearance of fruit. If Mr. Proctor will plant a bed of Crescent Strawberries entirely isolated from all other varieties he will be perfectly convinced that it is necessary to grow perfect-flowering varieties near them in order to obtain even a fair crop of fruit from the Crescent plants. I recall an instance of a small bed of Crescents that was grown at the Experiment Station at Geneva, N. Y., which was nearly 10 rods from another bed containing 15 different varieties. The plants produced an excellent crop of fine fruit that season. The next year the different varieties were all removed and the bed of Crescents, three-fourths of which were young plants and ought to have yielded an abundant crop of fine fruit, produced only a poor crop of small knurly berries.

POTASH IN FRUIT CULTURE.

ELI MINCH, SHILOH, N. J.—I saw in the R. N.-Y. for July 6th, an article on Mr. Hale's peach crop. I have long held to the views expressed in that article, and have advocated them in our State Horticultural Society, as our reports show. The effect of potash is to perfect the pollen and make a perfectly pollenized fruit that will resist cold and frosty weather far better than one poorly pollenized. This has been often confirmed in my experience with potash in peach culture, in the use of which I have been a pioneer. My present peach crop shows the value of potash in making a more perfectly set fruit, being the most promising in my section, where the peach this year is almost a failure from cold, wet and unfavorable weather. The liberal use of potash is, as I have long held, in many cases a preventive of the yellows, and a restorative for many diseased trees that show the symptoms of the so-called yellows. Soils naturally deficient in potash, should have an annual broadcast application of at least 400 pounds of muriate of potash per acre.

L. C. W., CALDWELL, WIS.—A late RURAL gave a description of the potato pests in the Rural Grounds and that neighborhood. The same blight flea-beetle and wire-worm are at work in the stalks of the potatoes in this section. Their ravages are worst among the early varieties, more particularly the Ohios. Three-fourths of all the potatoes planted in this section are early sorts, and according to the present outlook there will not be over one-third of a crop. Potatoes upon light soil are affected worse with blight and also with the flea-beetle and wire-worm in the stalks.

H. A. S., ROCK CITY FALLS, N. Y.—In reply to the inquiry of A. R. Q., Farmingdale, N. Y., relating to the snap-dragons, I would say that a liberal dressing of salt will effectually exterminate the pest. It is impossible to get rid of it by pulling.

S. F. W., ALLENTOWN, N. J.—I have just cut some nice mixed hay from level-worked corn ground. The stubs were cut when frozen the ground was rolled to settle the hills and it has worked well.

What Others Say

WHY is not the power of the wind more often made available on farms for doing light work? asks Henry Stewart in the N. Y. Times. The windmill has long been useful and in many localities has been synonymous with a corn or flour mill, cheaply grinding the farmer's grain and adapting itself automatically to the changeful breezes. And now that these engines have been greatly improved they seem to be vanishing out of use. This is to be deplored. For the light work of pumping water, cutting fodder, grinding grain, shelling corn, thrashing, cutting up silage, or cutting fire-wood, a windmill may repay its cost at least once every year, and with careful usage may last 40 or 50 years, or be replaced piecemeal, as it wears, in that time, and then be as good as new. A windmill attached to a barn or a silo is an evidence of the good sense, thrift, and respectability of the farmer who owns it, and is to be preferred before a great many of those other things over which farmers waste money uselessly.

SAUNTERINGS.

A CORRESPONDENT of the London Farm and Home, writing from Natal, South Africa, tells of a Kaffir fowl which he has owned for 10 years, and which has laid two eggs a day for 20 days out of every month during that time. Shades of Uncle Isaac! where are the Light Brahmas now? The much-vaunted achievements of Leghorns, Minorcas, Hamburgs, and others with their phenomenal records of 200 eggs per annum, sink into insignificance beside the record of this benighted biddy in the "Dark Continent." Should some enterprising American poultry breeder secure such a breed, the birds would be worth their weight in gold, and would pay a high rate of interest on the investment.....

THE experience of the Kansas Agricultural College with a stone silo has been most disastrous. During the two years they used a silo of exposed stone masonry, their loss of silage must have been nearly or quite 50 per cent. of its contents. Even where this stone-work was brushed over with a thick paste of cement and lime, there were found six inches to a foot thick of rotted silage in contact with the masonry. Afterwards the stone-work was sheathed over with inch stuff, leaving a two-inch air-space between the sheathing and the wall. The same silo since has preserved its contents without loss.....

D. M. Dunning of Cayuga Co., N. Y., has expressed the belief, in Popular Gardening, that he has found a remedy for the cabbage maggot. He found the cabbage roots "entirely encased in maggots." To 100 gallons of liquid manure he adds five pecks of quicklime. Stir this for 10 minutes. A pint is poured around each plant, the maggots are killed and the plants grow thriftily.....

ON the fourth of April, Mr. G. W. Robinette sent us several clusters of peculiar apple flowers with the following note:

"I send you some twigs of a wonderful apple tree which bears apples without bloom, without seed and without core. The apple is good, of medium size, and keeps until late winter or early spring." G. W. ROBINETTE.

Flag Pond, Va.

This same apple has several times been referred to in these columns by Dr. Hoskins, we think, and others. A magnifying glass showed that there were petals, though small in size and of a greenish color.

A recent article in the American Garden gives a portrait of these blossoms. Prof. Bailey, the writer, says that the pistils, instead of being five, as in normal flowers, are from 13 to 15 in number. There are no stamens.....

THE HOLSTEIN-FRIESIAN cow, Lady Baker, produced 34 pounds six ounces of unsalted butter in seven days. This statement, supported by a number of affidavits, is made in the Breeder's Gazette by Thomas W. Wales, of Iowa City, Iowa.....

So many varieties of grapes have been brought forward with extravagant and extraordinary claims which have not been sustained, that the careful and practical grape grower views with many grains of doubt, if not of suspicion, the new grape which is offered as "earlier than the Hartford; as healthy and as hardy as the Concord; better than the Delaware; and whose fruit never rots, and foliage never mildews." So says the conservative George W. Campbell. By claiming too much, introducers of new grapes have often misled and disappointed a generous, and perhaps too confiding public.....

WE have been striving, and hoping, and expecting to obtain the perfect grape, with all the excellencies, and at the same time suited to all localities. We have not found it, and we probably never shall. But we have varieties, that with intelligent care succeed admirably in particular localities, and are grown with both pleasure and profit to their owners. The same varieties in situations unsuited to their special characteristics would only result in failure and disappointment. When the fact is fully understood and acted upon, that varieties must be selected with reference to climate, soil and location, disappointment will be less, and success more certain.....

THE R. N.-Y. hears first-rate accounts from the Eastern States of the Early Essex Potato. We are told that it is decidedly earlier than the Early Rose, a heavier yielder and of better quality. This was introduced some years ago, as older readers may recall, by R. D. Hawley, of Hartford, Conn.....

ORCHARD AND GARDEN says that there is a demand for good home-made jellies and jams. This suggests a profitable occupation for some women who are earning money at home in other and more laborious ways. The jellies sold in our stores are mostly artificially manufactured and a brand of natural, home-made goods would soon bring prosperity to the maker.....

BRAN cakes are a French invention. They are largely used by the French government as feed for its cavalry and artillery horses. Two bucketfuls of loose bran can be compressed into a space but little larger than a man's hand. The compressed process consists, first in superheating the bran, and, then, second, in submitting it to a heavy pressure. Bran can be preserved for any length of time by this process. It keeps sound, clean and healthy. Cavalrymen in the French army put the cakes in their haversacks along with their own food and feed it without change of condition directly to their horses, one cake being a big feed, for a horse. Mr. George Bain, as Colman's Rural World reports, says that the invention might be of great practical utility in this country. On account of the bulkiness of bran it is impossible to ship it out of this country, and the saving that could be effected in freight charges and expenses in handling, if the bran were compressed, between points in this country, would amount to a very large sum. Mr. Bain is talking of putting in a plant in St. Louis for bran compression. The cost of the operation, after the machinery is once procured, amounts to about 60 cents a ton. All to whom Mr. Bain displayed the bran cake were charmed with the idea of compressed bran.....

A CORRESPONDENT of Farm and Home says that the cow that suits him best is a cross between the Jersey and Holstein. If pure on both sides at the start and then kept as nearly half-and-half as possible, this will result in cows that will retain the good qualities of both breeds; that is, rich milk and a good quantity of it. The cows will be of medium size, very hardy, quiet and good feeders, and in his opinion they are better adapted for farms than thoroughbreds.....

WORD FOR WORD.

— N. E. FARMER: "WINTER dairying will gradually force progressive dairymen into more intensive systems; better cows, better maintained, and on fewer acres, and possibly with the silo, soiling in some of its forms will take the place very largely of the summer pasture of wide range."

—SOUTHERN CULTIVATOR: "HE who loves home most loves his country best."

—DR. HOSKINS, in the Vermont Watchman: "We truly believe that if it were not for a little lingering shame, and if the State as a whole would permit it, common schools would be abolished by the popular vote in a good many New England towns. This is what we have been brought to, in great part, by 40 years of emigration, carrying off the most enterprising, energetic and pushing portion of our population."

—"OUR grangers have paid out more money to traveling shows and agricultural horse-trots, to demoralize their boys, than would have made the Grange the leading and most useful institution in the State."

—OHIO FARMER: "Despite all the terrible statutes and threats, and invectives, and abuse that have been fired at the dog for years, he grows more numerous, more defiant of law, and more of a privileged character every year. There is a reason for this, founded in the most noble attributes of the human heart. A man loves a devoted, faithful, disinterested friend, and that is what a dog is to his master."

—WESTERN RURAL: "When the mechanic strikes or does anything else to oppress the farmer, he works injury to himself: when trusts rob the farmer they are working ultimate ruin to themselves, for when all the greed that is robbing agriculture has succeeded in bankrupting it, grass will grow in the streets of our cities, the wheels of the factories will stop, commerce will be dead and desolation will be universal. Prosperous farmers make a prosperous people. Bankrupt farmers will make a bankrupt nation."

—AGRICULTURAL SCIENCE: "There are men in stations, who are born politicians, and who do not exercise the proper influence over their fellows. The advancement of science and practice, is, with them, secondary to advancement of themselves; in other words they are not in love with their work. Their influence is pernicious. There is another class of workers, men honest in all things, yet who do their work so carelessly and inaccurately their teaching is damaging. They mean to do well, but they are not capable."

—C. M. DEPEW: "The best lawyer is the one that always keeps his client out of court in a bad case and only goes in with a good one. In every suit one party or the other must be in the wrong and come out unsuccessful. It is the business of a lawyer on the losing side to discover his error before going into court."

—DR. PEABODY: "Science has repeatedly gone off with the fullest assurance on a false scent, and we have no more reason to place undoubting confidence in the theories of the 19th century than in those of the 17th."

—INDUSTRIALIST: "The measured acre which has grown wheat without manuring or rotation for nine consecutive years will this year, on the farm of the Kansas Agricultural College, raise its average considerably above the 23.4 bushels of the previous eight years. Full figures will be given later."

—LONDON AGRICULTURAL GAZETTE: "Sir J. B. Lawes, Bart., having endowed the Rothamsted Agricultural Experiment Station with the sum of £100,000, for the purpose of carrrying on the investigations after his death, has now appointed the trustees, who met at Rothamsted, and elected the following officers: Dr. John Evans (Treasurer to the Royal Society), chairman; Sir John Thorold, deputy chairman; Dr. Hugo Mueller, treasurer; and Mr. Herbert Cox, secretary. The trustees were conducted over the experiments by Sir J. B. Lawes and Mr. C. B. Lawes and afterwards discussed the steps to be taken for working the trust."

—EDITOR CHEEVER: "So in manufacturing establishments, on railroads and in the trades men are paid even rates for a day's work just as eggs are sold by count, not because the system in either case is quite just, but because the injustice is too small to be worth the cost of adjustment."

—PROF. SHELTON. "In our trials we found the cream a most discordant element. In the case of every cow employed with each kind of feed, the milk giving the largest display of cream often gave the least butter product."

—O. C. FARMER: "The farmer who breakfasts on fried pork, who eats pork and potatoes for dinner and more of the same sort for supper at this season of the year, should not find fault when he discovers himself to be ill. His table should abound with berries and fine vegetables. He owes it to himself and to his family to see that it is thus supplied. We are glad to know that the number of farmers who neglect this duty is steadily diminishing, but there are still enough remaining to make this admonition necessary."

—N. Y. HERALD: "To the Young Graduates—Do not let it out that you know more than your father. No doubt you do, but spare his feelings."

When the Energies Flag

Use Horsford's Acid Phosphate.

Dr. T. C. SMITH, Charlotte, N. C., says: "It is an invaluable nerve tonic, a delightful beverage, and one of the best restorers when the energies flag and the spirits droop."—*Adv.*

Miscellaneous Advertising.

Hood's Sarsaparilla 100 Doses One Dollar

That Tired Feeling, so oppressive, overpowering and difficult to throw off, may be the warning of wearing out or breaking down of the system. It is entirely overcome by taking Hood's Sarsaparilla, which gives great mental nerve, bodily and digestive strength.

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lame-back, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

BEACHAM'S PILLS cure sick headache.

EMPIRE POWER and SEPARATOR

BEST, CHEAPEST and MOST IMPROVED in the market.

We also manufacture Field Rollers, Plows, Feed Cutter and Crusher Hand & Power Corn Shellers, etc. Send for Illustrated Catalogue & Price List. S. S. HESSINGER & SON, Tatamy, Northampton Co. Pa.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
HERBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JULY 27, 1889.

Now, right now! *This* is the time to do it! Read the Rural Grounds sermon under Domestic Economy, ye procrastinators!

FARMERS in lonely districts at the South have long felt that the burial of the dead is made unnecessarily expensive by the extortionate charges of dealers in undertaker's goods. Not long ago an Undertaker's Trust was formed and the result has been to force prices for burial equipments to a higher rate than ever before. In fact, the situation has become unbearable, and the Georgia Farmers' Alliance has come out in open warfare against the Trust. The South is overrun by agents for various tombstone companies who well understand the art of working upon the sorrows and sympathies of the afflicted.

IN England the open air silo has been quite successful. Some of our friends have urged the introduction of the silage stack into this country. Much of their advice was not based upon experience; they simply urged what they thought *ought* to be valuable. Experiments do not round out their claims. In the Northern States the weather is such that silage is much better fed out and handled under cover. A good deal of the out-door stacks have spoiled and the work of hauling to the barn is too much. The American silo should be in the barn. That point seems settled. The plan of curing corn fodder described in the R. N.-Y. by Mr. C. S. Rice is about as close as we are liable to get to an open-air silo.

It is as impossible to raise a good colt from poor parents as it is to raise a good crop of grain from poor seed and a worn-out piece of land.—page 491

IN a late English work on the use of chemical manures, the following occurs:

"Farmers often make the mistake of adding an excess of manures (plant food) to their land. What are the results to ourselves if we go to excess in eating and drinking? Why, disease. It is exactly the same with farm crops. Many crops are spoiled by over-manuring the land."

Not long ago the R. N.-Y. was in doubt as to the wisdom of making a late application of fertilizer to potatoes. A farmer who was appealed to for advice, replied:

"I do not think potatoes are enough like human beings to be made sick by over-eating. They can never take up more plant food than they can digest."

Now which is right, good reader?

IN December last, as noted in the R. N.-Y. at the time, the Department of Agriculture received from the Chief Secretary of Queensland, Australia, a request that the Department should nominate to the government of the colony, a suitable person to be appointed as instructor in agriculture. Last Thursday Secretary Rusk selected our contributor Professor Edward M. Shelton, of Manhattan, Kansas, for the position, and so notified the Australian government. Professor Shelton has been for many years Professor of Practical Agriculture in the Kansas Agricultural College. He has also been connected with the Michigan Agricultural College, and has taught practical agriculture under the auspices of the Japanese government. Secretary Rusk says Professor Shelton is the best man available in the United States for the position, and is confident that he will creditably represent the country. In this opinion the R. N.-Y. fully coincides.

THE R. N.-Y. is glad that Secretary Rusk has established an Editorial Division in the Department of Agriculture. As heretofore stated in these columns, the head of this Division will edit the various reports and bulletins that are issued by the Department, and issue an easily-read synopsis that will take the place of the great volumes to which we have previously been treated. The big volumes will appear by themselves; but we venture to say that very few of them will be read. The need of such work as that proposed by the new Division is pointed out on page 503 of this issue. "Colic in Horses" and "The English Sparrow" are very striking illustrations of the need of an editor. The R. N.-Y. will continue to review the bulletins and reports in its own way. One word of caution. During the next year farmers will be favored with a perfect deluge of information from the experiment stations. This new system of editorial work will provide abundance of "copy" for editors who do not now look inside the reports. The point to remember is that these reports are the results of experiments and must be tested at home before being largely adopted.

For "breaking," "training" ought to be substituted; but if one does not teach a colt how to work, lead and be dutiful while it is a colt, it will certainly need "breaking" later on.—page 491.

FARMERS throughout the country will watch the proceedings of the constitutional conventions of the four new Western States with interest. In forming their constitutions these States will have the advantage of viewing the results and failures of measures tried in older States. On the general principle that it is easier to start right than it is to get into the right rut after running for awhile in the wrong one, we may reasonably expect that the delegates to the conventions in the Dakotas, Montana and Washington, will use the utmost care in preparing their State constitutions. We shall look with a good deal of interest to see what action is taken in the matter of taxing railroads, controlling trusts and corporations and disposing of school lands. In the Dakotas particularly, where farming is the chief industry, the action taken in these matters may fitly represent the views Western farmers have arrived at. Judge Cooley, in addressing the North Dakota delegates, said that one great tendency in forming a constitution was to leave too little to the people. The constitution of an intelligent people should grow and develop, keeping pace with great changes in society and industry. Surely these Western delegates have a wonderful chance to produce model constitutions.

SPECIAL NOTICE.

IN reply to inquiries we may state that the inner portion of the flowers of the potato R. N.-Y. No. 2 is a light purple. This purplish color covers irregularly about *half* the corolla. The outer portion is nearly white. The proportion

of white and purple is shown in the illustration which was carefully drawn from nature. This variety *never bears solid white* flowers. The stems also are, here and there, *tinted* with purple. They are long-jointed and branch less freely than do most other varieties.

THE DAIRY BUSINESS.

THERE is to be a boom in the dairy business. More butter and cheese will be made and more milk and cream will be offered for sale. This will mean over-production and lower prices unless new markets can be found. There is a market for millions of pounds of our butter and cheese in Europe—we mean for millions of pounds more than we now send there. This market never can be secured until every pound of butter and cheese that leaves this country is guaranteed. Only first-class goods are wanted. This relief for our dairy markets will never be found until the quality of American butter equals that of Danish or French butter, and American dealers inaugurate such a system of inspection that goods below the standard cannot be shipped. The R. N.-Y. believes that this system of inspection will, sooner or later, be perfected, and we believe that this will mean a good increase in our dairy exports, but butter-makers must back up the butter dealers.

Does the R. N.-Y. advise the farmers who are driven away from beef making by the dressed beef trade to take up dairying? No direct answer can be given to this question. Too much depends upon the man. Some men are natural dairymen; others never can make good butter. The writer of this enjoys taking care of a cow, while the hired man loves a horse, but can hardly be induced to milk. We regard any general advice to farmers in this line therefore as absurd. One thing is sure—an over-production of inferior grades of butter will improve the chances for disposing of first-class butter. This is a principle of business that has been proved a dozen times. Butter making is a science. In all the history of the world there never was a time when facilities for the study of this science were more easily available. Feed, cow and tools; these are the dairy factors that all must recognize. The three must be perfect—that is best adapted to the local conditions. Recognizing the great importance of the dairy industry and the peculiar interest just now attached to it, the R. N.-Y. will endeavor to give special attention to this department hereafter.

I maintain that a man who has no love for a horse could never raise a good colt. His idea of training a colt is, first of all, to let it know what a whip is for, and its second lesson is a continuation of the first, and the third and fourth are repetitions of the others until the colt knows nothing except the whip.—page 491.

THE GREAT INTERNATIONAL EXPOSITION OF 1892.

IT appears to be the universal opinion that the four hundreth anniversary of the discovery of America by Christopher Columbus, which will occur in October, 1892, should be celebrated by holding, on this hemisphere, a grand international exposition in which the world may be made familiar with American resources, American products, American manufactures, American enterprise and American characteristics and achievements. All agree that the exposition should be held in this country, the most powerful, most populous, most enterprising, most advanced in all the arts and sciences of all the countries in the New World. In what city in this country should it be held? The nearly universal opinion is that New York is the most appropriate place. Washington is the chief rival claimant for the honor, as the capital of the United States. But Columbus did not discover the United States—he discovered America, and New York is the acknowledged commercial, artistic, industrial, scientific, and literary capital not only of this country, but of the whole continent from Point Barrow to Cape Horn. Washington has neither accommodations for visitors nor means of amusing them during their stay, nor even facilities for getting them there. It is on one of the by-ways of the nation so far as the transportation of domestic exhibits and visitors is concerned, and inconveniently sidetracked on it in regard to those from abroad. It is a huge boarding-house for clerks and transients. It is the head-center of the politicians of the country, and the undertaking there would degenerate into a vast political job. It has few public-spirited citizens rich enough to aid the enterprise materially by contributing towards its cost. It lacks executive ability to organize, complete and manage so great an undertaking in a manner worthy of the nation, and it lacks energy, tact and broad-minded liberality to make it successful.

On the other hand, New York has already 215 well-known hotels with ample accommodations for 75,000 people, and minor hotels and boarding-houses that will easily accommodate 100,000 additional; while there is room for 200,000 more in private houses and flats which would be at the disposal of the public during such an occasion. Then there are hundreds of hotels and boarding houses in Brooklyn, with its 1,250,000 population, on one side; and in Jersey City, with its 200,000, on the other, to say nothing of the accommodations in Staten Island, and numerous towns in Long Island, New Jersey and Connecticut, within easy reach of the city by rail and water. Then there is a multitude of restaurants suitable to all tastes and pockets scattered everywhere throughout the city. There would be no difficulty whatever in comfortably housing and feeding from 400,000 to 500,000 strangers in New York and its environs, and this can be said of no other city in the country.

What other city has so many theatres, art galleries, libraries, clubs, churches and other sources of amusement and mental as well as moral improvement for visitors, who must, perforce, pass most of their time outside the Exposition walls? Then, think of the vast resources in this way of the suburbs across the East and North Rivers!

No other city in the nation or in the world has such ample transportation facilities for exhibits and visitors. All the great railroad lines of the country converge to this outlet. There are eight main lines, and 1,750 trains now arrive and depart every day, and the number could be greatly increased if the traffic demanded it. Then there is a multitude of local steamship lines along the Sound and up the North River, and a still greater number to seaboard cities from Portland, Maine, to Galveston, Texas. These lines could run excursions at low rates and furnish food and beds to a million in the course of the season. The more foreigners who can be induced to make displays at the Exposition and to visit it, the greater will be its success, and no other city can approach New York in its transportation facilities with other nations. Official statistics show that over seven eighths of the people who come to this country from all directions land here. There are no fewer than 54 regular lines of steamers that leave this port for the chief seaboard cities of the world, affording transportation facilities for passengers and freight to all parts of the world, even to distant China, Japan, and Australia, while hundreds of "tramp" steamers supplement these to places whose traffic is less.

New York can justly boast of the public spirit, wealth and enterprise of her citizens, and should the great International Exposition be held here, all the necessary capital can be readily subscribed. Then again, New Yorkers are accustomed to handle large affairs, which their great executive abilities render successful. Without derogating a particle from the advantages and virtues of the various other claimants for the Exposition, it is the simple truth that the transcendant housing, feeding, amusing, instructing and transportation facilities of New York, as well as the wealth, public spirit, enterprise and executive ability of her citizens, fit her pre-eminently to make the Exposition a source of instruction and profit to the industries of the country, an honor to the Nation and a beneficial object-lesson to the world.

"To skim off the virgin fertility from large tracts, as rapidly and with as little solid advantage as possible, and to pass on and on, repeating the same process in illiterate and ragged independence, has been a distinguishing mark of American farming, East and West, North and South."—DR. HOSKINS, page 497.

BREVITIES.

CORN will be good property.

PRICES for No. 1 hay promise to be highly satisfactory. The crop has been large but a good deal of it has been injured by the continual wet weather.

SOUTHERN stockmen are a little excited just now over the probable feeding values of cotton-seed hulls. The R. N.-Y. is of the opinion that it will be found that the greatest values of these hulls lies in the ashes used as a fertilizer.

THE dairy worker who colors butter in the churn works on the principle employed by the one who depends upon green grass for a color. They both aim to get vegetable coloring matter into the product. In one case the cow does the work, and in the other the dairy worker does it.

IN all the poultry shows held in England, the Dorkings still lead while Langshans seem to be second. The American breeds do not seem to meet with much favor yet. The R. N.-Y. likes the Dorking fowl and is breeding chickens from a Silver-Gray Dorking rooster for next season's hens.

IT is reported that preparations are being made by large cattlemen to push heavy shipments of live cattle to Europe next month. There is reported scarcity of good cattle in Europe just now. While these shipments will relieve American markets somewhat, it is not probable that prices will be seriously affected.

AGRICULTURE; AN ART, A BUSINESS, A SCIENCE, ETC.

T. H. HOSKINS, M. D.

II.

AS A BUSINESS.

"BUSINESS is business," but American farmers generally have not so recognized their vocation. The old hundred-bale cotton planters, the sugar planters, the great tobacco planters, the hemp planters, the hop planters and the sheep and cattle ranchers have generally looked upon their specialties in a business aspect; but just so far as they did so they have renounced the name of farmer, have tried to claim for their vocations distinctive titles, and have assumed a more important social position, analogous to that of the professional, commercial and manufacturing classes. So long as the possession of systematized knowledge and its useful application are so universally recognized as advancing the title of the possessor to social distinction, the drawing of such lines will have to be recognized, even in the most democratic society. Our distinguished men in America are distinguished not so much by any personal assumption, as by the spontaneous recognition of their importance as citizens by the whole community. We have, in fact, no other basis upon which public consideration of the individual can steadily rest.

Aside from the class of exceptions here indicated, there is no country on earth where the ownership of land confers so little personal importance upon the individual as in America. Until lately, land has been the one thing of which we have had too much; and the term "land-poor" has even become an epithet of contempt. To skim off the virgin fertility from large tracts, as rapidly and with as little solid advantage as possible, and to pass on and on repeating the same process in illiterate and ragged independence, has been a distinguishing mark of American farming, East and West, North and South. Here and there real homesteads have been established by men of a different type; but they have been with difficulty maintained. The trumpeted attractions of this, that and the other new locality, have drawn away the young; and the attempts to fix families, and build up true homes, have been almost universally a dreary failure.

But the era of wide expansion is drawing to a close. Arable North America has been thoroughly explored, and the "moving on" tendency is evidently abating. No one part of the country is found to possess any marked superiority over another. The blessings of Providence have been very evenly distributed, and on the whole one place is about as good as another. If there be any actual superiority, all things considered, it would appear to reside in those parts which have furnished the greatest number of emigrants; for toward those old States there is already a reflux, and to them are constantly being made the appeals for financial aid which they certainly could not grant, were they so inferior in natural resources to the newer sections as they have been represented. They had themselves in the early days no "old States" to appeal to for aid. Their capital has all been developed out of their natural resources by the industry, skill and prudence of their people; and to-day the "great and rich" West is looking continuously, eagerly and successfully to the "worn-out East" for the promotion of that very progress it so loudly vaunts. Nothing is truer than that the East is the "rich daddy" whose dollars enable the West to "spread herself."

It is right in the East, too, that business principles in their application to farming are being most rapidly developed. Many men who in their youth abandoned the farm for trade have, in middle life, returned to the farm, and they have brought back to the work then the methods of trade, which have proved thoroughly helpful upon the land. All through New England (and it is the same elsewhere) are to be found ex-merchants and manufacturers engaged and deeply interested in agriculture. Such men are not content with the old ways. They see at once how slipshod and wasteful those ways were, and they set themselves to improving them. In some respects farmers of this class are apt to be rather fanciful, and not quite mindful of the peculiar conditions which surround all agricultural work. But they have generally learned how to learn; and they take the luck of seasons, and the teaching of mistakes, patiently. They come up smiling at all our agricultural meetings, and while they present the statistics of their farming in clear and convincing figures, they share with the rest of us the knowledge extracted from every failure, as well as from the more and more frequent successes.

One asks "what are these business principles"? Briefly, they consist in the substitution of exact knowledge for guessing; of the application of sound principles for loose inaccuracy, and the use of weights and measures, records and figures, as means of getting at the best way of doing all sorts of work, and the final exclusion of all ways that cannot be justified in the same manner as commercial operations are justified. Every young farmer would be the better for a business education, if it did no more than enforce upon him the importance of system, accuracy, promptness and untiring perseverance. "Well enough," and "about right," are terms that must be dropped out of the vocabulary of the farm.

Farm Topics.

SOME COGITATIONS.

FRED GRUNDY.

ALAS FOR THE CONTEST PLOT!—I have just been looking at a prize patch of potatoes wherewith a certain party proposed to capture a thrashing machine, back-action churn, or some similar implement. As I gazed I smiled. I smiled as I thought of the energy and assurance "she" displayed when those potatoes were planted. How a night-mare of drought sat upon that patch and the tubers remained in *status quo* for five long weeks, while the prospective thrashing machine went glimmering! How they finally came up only to meet the omnivorous cut-worm and be smitten in their youth, while the prize back-action churn disappeared in the haze. How the cut-worm grew corpulent and gouty, and finally withdrew in favor of his co-laborer, the frisky gentleman in the striped jacket, who increased and multiplied and fared sumptuously every day. How the rains fell and the floods came until the patch resembled a submerged forest, which grew paler and paler as the days went by like a Mississippi bottomite afflicted with the shakes. How the back-action churn simmered to an aquapult, then to a book, and finally to a few garden seeds, which are also fading and floating away into the "nevermore!" Thus do bright anticipations attenuate and disappear. Thus does the energetic husbandman—or woman, as the case may be—spit on his hands and roll up his sleeves when he hears the song of the blue bird in the spring time, only to roll them down again when the melancholy days come, and vow a great vow that he'll manage things differently next year.

THE CUTAWAY HARROW AHEAD.—I have seen two farming operations this season, which were new to me. A neighboring farmer plowed 35 acres of wheat stubble last August, intending to put it in wheat again in September. He changed his mind, however, and decided to keep it for corn this spring. He began work on his corn land first, and when he reached this piece the season was getting well along. As there was no trash to speak of on the ground he supposed he could prepare it for planting by going over it with a disk and common harrow, but when he came to try it he soon learned otherwise. The winter rains had run the soil solidly together, and it was now baked so hard that the disk made scarcely any impression upon it. After fooling away a couple of hours, he came to the conclusion that it would have to be plowed, and he set his man at it. A kind neighbor who owns a Cutaway harrow offered to lend it to him, telling him that it would "chaw that land up like a mice." He accepted the offer and tried it, and, sure enough, it did "chaw it up" in style. By going twice over he made a perfect seed-bed without using a harrow. The corn came up evenly and a prettier stand it would be hard to find anywhere. I had seen the Cutaway harrow on exhibition, but had never before seen one actually at work. It is a valuable implement, and for such work as this, is much superior to the disk, because it cuts in deeper and digs up and loosens the soil better.

THE HARROW AGAINST THE CUT-WORMS IN CORN.—The other operation was fighting cut-worms with the harrow. In the early part of May, when the weather was cold and the ground almost as dry as dust, the cut-worm was abroad and hungry. Just across the road a neighbor has 30 acres of corn, and it did seem as though the pests would clean it up for him. He said to me: "I'm not an advocate of harrowing young corn, but this is a desperate case, and I have decided to give the worms a rasp, let the consequences be what they may." It was plain that the worms would get most of the corn if let alone, while if he riffled them up with the harrow a few times there was a possibility that he might save a portion of it. As he harrowed, a flock of blackbirds followed close after and gobbled up every worm that was uncovered, and there were hundreds. The ground was perfectly clear of trash, so but little corn was torn out, while he kept close watch and uncovered all that the harrow covered. As a result he now has a very fair stand of corn—enough to make at least 40 bushels per acre. Sometimes it is advisable to harrow corn, and sometimes it isn't. It all depends upon the condition of the ground.

STRAWBERRIES AND RASPBERRIES.—This is the 17th of June, and just winds up a month of strawberries. My quota has been limited to a heaping big saucerful three times a day, with sundry and numerous "specimens" whenever I passed the patch. We began with the Crescent and by the end of another week will finish with the Jessie. Crescent and Capt. Jack gave us the most berries, Bubach the largest, and Jessie the fairest to look upon. During the very rainy weather the Bubach tasted much like a washed-out turnip The Crescents never failed to be sufficiently acid for all practical purposes. They never needed lemons to give them snap. The Jessie is a pretty berry, but I couldn't find any plant with several quarts on it, *a la* Col. Green.

As the strawberries depart the raspberries come in. The Tyler bushes are now flecked with big, shiny black beads. The Turner is beginning to blush, while the Cuthbert is still blooming. Five or six weeks of raspberries will bring us to blackberries, and the Kittatinny bushes are full. Snyder ditto. Then come grapes, peaches, apples, etc., etc. Who wouldn't own a *modicum* of soil and grow an unceasing stream of fruits, at the fountain-head of which he can feast unvexed? Tra la!!

Christian County, Ill.

Arboricultural.

TWO NEGLECTED SHADE TREES.

IT need not be understood that because I say two, I do not know that there are many of our noble native forest trees the merits of which are too little known; but my attention has recently been particularly called to two of them.

THE TULIP TREE.

Only a few feet from where I write stands a fine specimen of Liriodendron tulipifera, the Tulip-tree, White-wood or Yellow Poplar, now in full bloom; but I know of no other in the vicinity. Perhaps one, and the principal reason why this tree is not oftener seen as a shade tree is the supposed difficulty of transplanting it from the woods; but that difficulty is readily overcome. Take up the tree when an inch or two in diameter, early in spring, or as soon as the leaves drop in the fall, shorten the tap-root and cut off the stem about a foot above the root; then plant properly, and at least 90 per cent. will grow and do nicely. These trees may be raised from the seeds, which, if planted soon after they ripen in October, will germinate and send up fine shoots the next spring; but if planted in the spring they will not make a showing until the next year.

The Tulip-tree belongs to the Magnolia family, and is common in the Atlantic States from Canada south, but is often found beyond the Alleghanies. It likes a moderately good, light loam or sandy soil, moist, but not wet, and in favorable locations grows to an enormous girth and hight. Downing mentions a specimen whose stem, five feet from the ground, measured 22 feet and a-half in circumference, and was 130 feet high. The flowers are large and beautiful, tulip-shaped; but they are borne so high as often to escape notice. The leaves are large and peculiar in form, rich and glossy. The tree is seen to its best advantage when standing alone. Differences in soil and situation change the color of the wood, that is, white or yellow, as circumstances determine, but make no difference with the general appearance of the tree. Among its other merits as a shade tree is its freedom from insects, only a few species being attracted to it.

THE YELLOW-WOOD.

The other tree to which I desire to call attention is Cladrastis tinctoria, the Virgilia lutea of Michaux, commonly known as the Virgilia or Yellow-wood, fine specimens of which may be seen in Brooklyn Park; but it is found at its best in Kentucky and Tennessee, though it is not abundant even there. It seldom grows more than 40 feet high. The leaves are pinnated in form, and expand late in the spring. The flowers in this vicinity are seen about the first of June in racemes or clusters, pea-shaped and pure white, reminding one of those of the Honey Locusts, with a slight and agreeable perfume. The bark is smooth, of a greenish-gray color, and the leaves in autumn take on a bright yellow tint. Its heart-wood is yellow and from it a coloring matter is often extracted; hence its common name. This tree is also quite difficult to transplant, as it has many small fibrous roots that are so tough that it is almost impossible to cut them with a spade; but it grows readily from the seeds which ripen in August. It is quite a rapid grower and blooms when 10 or 12 feet high. It deserves to be better known.

L. A. B.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

ONE of the most delightful books for our girls is "The Five Talents of Women," by the wise and witty author of "How To Be Happy Though Married." The five talents of women, according to Mr. Ruskin are: "To please people, to feed them in dainty ways, to clothe them, to keep them orderly and to teach them." Some French author says that a woman's talents are opportunities for doing good—suppose we add that to the other five, and we have the ideal of womanliness. It is worth noting that while the æsthetic Ruskin puts pleasing people first, he puts feeding them next—indeed, the two often go together.

* * *

Now, a good many good women often lose sight of that important matter of pleasing people; they seem to think, as cares and duties thicken, that they may attend solely to material duties, without thoughts of pleasing in other directions. True, some are so situated that any attempt at pleasing, further than attention to thickly-crowding duties, seems impossible; yet many there are who lose opportunities in this direction. We recollect reading somewhere of an epitaph over a hard-working wife in some rural cemetery. It was very brief—after the name and age there were but these words:

"She was so pleasant." Just think how much daily happiness that implied—it was worth a whole column of ordinary praise.

* * *

As for feeding people in dainty ways and clothing them, a good many busy women are apt to do too much of both. But "to keep them orderly," you see that is put as a purely feminine power, and whenever we see a man or boy bang down his hat on one chair, his coat on another, and his boots just anywhere else, we always feel that some woman has neglected her duty. Orderliness doesn't often come by nature, although "order is Heaven's first law," but training will make it second nature. Begin at the beginning; let the children understand from babyhood that what they throw down, that must they pick up; that everything has its time and place, and it will save many an hour of picking up. Disorder leads to dirt, too, as a natural consequence; teach a child to be clean and orderly, both in person and belongings; it is a very good foundation for other virtues.

* * *

THE last talent in the list, that of teaching, seems essentially a woman's prerogative. We don't mean just teaching A, B, and C, but molding mind, manners and morals to be a harmonious whole. A child's mother is always the first and best teacher, the most natural one, and sad it is to see a mother unfitted for this office. A good and wise mother is the greatest blessing this world affords, and she who exemplifies the five talents quoted, certainly deserves this title. Read the "Five Talents of Women," young women and old, and, if you contemplate the double life, follow it with "How to be Happy, Though Married." The author, Mr. Hardy, is an English clergyman, a Christian, a gentleman, and both wise and witty too. Few can read either book without benefit.

* * *

KEEP COOL. That sounds ironical these dog-days, when there are baking and churning and sweeping to do, everything to be done, and one pair of hands to do it. Yet there is no doubt that calmness of mind does much to produce coolness of the body. If we

could only keep serene and happy, whether everything is done just so or not!

* * *

THERE is no doubt that we do a good deal of unnecessary cooking in the summer. Of course, where there are men doing heavy work it is manifestly impossible for them to live on fruits, vegetables and cereals—we believe that a certain amount of meat is absolutely necessary. But there is no reason why all the fruit should be cooked up into pies and puddings—give it to them in its natural state, or stewed. Stewed fruit, with good bread and butter, is, in many cases, more wholesome than pies, and certainly it does not cause the same amount of back-breaking work. We do like pie, but not when it adds excessive weight to the burden of work, already heavy. Such fruits as blackberries or raspberries are often more wholesome stewed than raw—the seeds are very irritating to many digestions. They are not very desirable for little children.

* * *

A REALLY wholesome dessert for the time of harvest apples is the old-fashioned Brown Betty. It is made in various ways, but we like the English mode. The apples, peeled and cored, are stewed until quite soft with very little water and a bit of lemon peel; when done, they are beaten to a pulp, a little butter and sugar mixed in and then put aside to cool. When cool, two eggs are beaten light, and mixed with the apple; then an equal quantity of bread crumbs. A buttered mold is thickly sprinkled with browned-bread crumbs, this is filled with the mixture, and a layer of crumbs put over it. Bake in a slow oven, then turn out and eat with cream.

OUTINGS IN NEW ENGLAND.

XIV.

MARY WAGER-FISHER.

THE meagerness of the soil and the abundance of rocks about Marblehead, would seem to make the burial of the dead in the ground a difficult operation, as it evidently was in the olden times, as many of the graves were dug in the slender valley between the rocks. It is a custom borrowed from England, to bury about the meeting-house or church, but it is a custom to be deprecated in all localities where dwelling-houses are likely to be built near-by, as I believe it is an established fact that wells drain the land from half a mile around, and it is not pleasant to think of drinking water that has percolated through the remains of our ancestors.

The date of death on the oldest stone in the Marblehead grave-yard is 1681. Quite a number of Congregational preachers were buried there, and it is curious that, next to New England, the stronghold of Congregationalism is on the Pacific coast. A white marble monument commemorates a sad event for the little town, when the entire crews of 10 fishing boats, consisting of 65 men and boys, perished on the Grand Banks of Newfoundland. Not many negroes who were slaves in New England had their graves marked by tombstones, but there is *one* in this old graveyard, and the inscription on it is a curiosity.

Agnes, Negro
Woman Servant
To Samuel
Russel, Aged About
43 years, Dec'd
July Ye 12, 1718.

Another stone to the memory of Mrs. Miriam Grose, testifies to the fact that she left, in the 81st year of her age, "180 children, grandchildren and great-grandchildren"—an appalling progeny! However much it may be considered out of taste to tell tales on tombstones, a loquacious graveyard is, nevertheless, a valuable contributor to history and a great source of entertainment to visitors who feel a mournful interest in that kind of literature. The most conspicuous building in Marblehead is Abbott Hall, named from Benjamin Abbott who bequeathed $100,000 to his native town, and part of the bequest was used in the construction of this building which has a lofty tower, 160 feet and one inch high, and which gives the finishing touch to the pictorial view of Marblehead, as seen from the water. There is a fine reading-room in the hall, a public library and several fine paintings, one of which is Willard's famous "Yankee Doodle," which was shown at the Centennial in Philadelphia.

When the time came for us to leave Marblehead, we went up into New Hampshire to visit friends in Nashua. It had been many a year since I had seen them, and it was with a sense of pleasure at being recognized at once—it seemed indeed but a short time, but with a tall lad at one's side, one cannot help feeling that the years have rolled away in stern reality, and carried with them a sorely begrudged portion of the freshness of youth. Nashua is full of Canadian French spindles and factory girls, but its environs are charming. The trees were in superb autumnal coloring and to see the New England landscape in its glory, is to see it in late September. In our drives, into the adjoining country I saw what I have never elsewhere seen, a lonely building in a lonely field, labeled "Small-pox Hospital."

To see French-Canadian or any other class of laboring foreigners, is to be impressed with the superiority of the good looks of Americans. I never yet saw in even the commonest American—an American of two or three generations—the pitiful lack of intelligent expression, of mental alertness, that so often characterizes the physiognomy of the low-bred European. The consciousness that one has a chance to better his condition very quickly acts upon the countenance, and I believe that one could form a very accurate estimate of the government of a country, by simply seeing the faces of the people.

We returned home by way of Worcester, Hartford, New Haven and New York to Philadelphia, the entire route in New England being one long panorama of gorgeous color, reflected in numberless lakes, rivers and smaller waters. Birches grow in great abundance along the streams, and lean forward in lovely clumps as if to catch a glimpse of their pretty bodies. The Capitol Building at Hartford makes a brave show, and at New Haven the Soldiers' Monument forms a striking shaft against the sky. Hartford in the earlier days in Connecticut, was the literary center of the State—Lemuel Hopkins, Trumbull, Theodore Dwight, Mrs. Sigourney, and Noah Webster lived there. Mrs. Stowe has made it her home also, living there with her twin daughters. But so great has been the clock-making glory of Connecticut, that in riding through the State one half expects to hear everything vibrating with the "tick-tock" of time-keeping machinery. Wooden clocks of the high old pattern were made at Waterbury 200 years ago; but in 1821 the manufacture of brass clocks was begun, and in less than 20 years the State produced clocks to the value of more than a million dollars annually, and for years the world has been supplied with Connecticut clocks and watches. The Connecticut Yankee has a strong natural bent for mechanical pursuits, and his ever-present idea is, not to work but invent some machine that will do the work for him. English visitors to work-shops of New England are surprised at the intelligence of the mechanics, and their use of tools and methods, that are so exceptional in the shops of England. When Dr. Howe of New York invented his machine for making pins at one operation, he could find the kind of workmen he required only among the Connecticut brass-clock workers, and so it came about that the manufacture of pins was established in Connecticut, and to make pins, brass wire mills had to be established; in such wise Yankee cleverness has turned New England into a vast manufacturing center. It doesn't pay to farm, the men say; for they can't compete with Western products. But if the "surplus women" were to turn their attention to horticulture, they would undoubedly give to the soil a new value. Some one has said that the Pilgrim Father had an amazing faculty for settling on the most unpromising localities to be found in the new world—which is in a way true. The Yankee of to-day has a thousand times his shrewdness—he would have "gone West" at the beginning! But with all the money-making possiblities of the West and South, there is a charm about New England that appeals to the mind and heart as no other section of our country does. It is to the nation much what one's birth-place is to the individual, and people from every State in the Union come in the summer outing season to her rock-bound shores.

A PICK-UP DINNER.

COTTAGE MAID.

AN oft-recurring spasm of economy was chiefly responsible for Mrs. Brown's determination to make a dinner without any extra marketing, and she went through ice-box and pantry, fully resolved that she would make their contents do, whether scanty or the reverse. A family of three was to be provided for—a task often more difficult, as far as economy is concerned, than where there are more. Young Mrs. Brown took the various "left-overs" from her ice-box and surveyed them with critical disapproval.

"One scrag of beef-steak and two cups of gravy—that means soup," and the fragments were soon simmering, to the surprise of her school friend, who regarded such things as a legacy for the ash-barrel. A bowl of stewed tomato from yesterday's dinner next appeared, so it was decided that the simmering compound should become tomato soup. A little dish of cauliflower in white sauce, a few cold potatoes, and part of a cold roast chicken were severally revealed.

"The chicken is too much dismembered to be eaten cold, so it becomes a mince," observed the housekeeper. The dressing was removed and put aside, while the fowl was separated and put on to stew slowly until the flesh parted readily from the bones. This took about an hour and a half. When thus cooked, the bones and meat were removed from the gravy. Skin and bone being put aside, the meat was minced and returned to the gravy together with the dressing which gave an agreeable flavor to the whole. This simmered for half an hour; 15 minutes before it was served it was thickened with a teaspoonful of flour smoothly dissolved in milk. Half an hour before dinner-time the soup, in which a spray of parsley and bit of celery had been simmering, was strained, and returned to the stove. The tomato was warmed and then strained through a sieve before being added to the stock, and seasoned. Fifteen minutes before dinner, it was slightly thickened with a tea-spoonful of cornstarch dissolved in milk; after boiling five minutes it was lifted to the back of the stove.

"How much tomato do you use in a dish of soup?" inquired Mrs. Brown's schoolmate.

"I cut my coat according to my cloth," said that culinary artist with a laugh. "Really, I think the proportions are nearly equal of stock and strained tomato, but I use just what I happen to have, without reference to exact proportions."

"What becomes of the cold potatoes?"

"Why, a salad. Here is half a lettuce, dish of cold potatoes, and a few pickled beets,—and a bit of parsley—we will have a fine salad. Here is one forlorn poached egg left from breakfast, which we will boil hard, and use in the dressing."

Mrs. Brown took her oval glass salad-boat, and put a border of crisp lettuce leaves all around it, with here and there a slice of crimson beet nestling in the soft green. The cold potatoes were sliced as if for frying, sprinkled with chopped parsley, and piled in the center of the dish. Over all a dressing was poured, made as follows: The yelk of one egg, boiled hard, was rubbed into a smooth paste. To this was added one salt-spoonful of salt, half a salt-spoonful of pepper, and a little mustard. Two table-spoonfuls of olive oil were slowly stirred in, until thoroughly mixed, and to this were added two table-spoonfuls of vinegar. A few drops of onion juice are by many considered an improvement. In the meantime some smooth, well-scrubbed potatoes were baking, while the left-over cauliflower in its sauce, was warming in the double boiler.

For dessert, Mrs. Brown made an old-fashioned Brown Betty, after an English recipe, as follows: Stew half a dozen cored and peeled apples until quite tender, with a piece of lemon rind, a little water, and sugar to taste. When reduced quite to a pulp, mix in a piece of butter, and let it stand till cold. Beat a couple of eggs, and mix them and the apples together with an equal quantity of grated bread. Have ready a buttered mold, sprinkle it very thickly with baked bread crumbs, fill up with the apple, etc., and then add a layer of crumbs. Bake in a slow oven, turn out carefully, and serve with cream.

When dinner-time came, pieces of toasted bread were laid in a tureen, and the soup was poured over them, a bit of the bread being served in each plate. The minced chicken was garnished with triangular pieces of toast, and the baked potatoes, cracked open on leaving the oven, to avoid soddening, were brought to the table wrapped in a napkin. The toast garnishes and the Brown Betty made a tasty and economical means of using stale bread. The table was prettily set, and the dinner, being carefully cooked and well served, gave no idea of being a "left-over," but, then, careful cooking and tasteful serving will make the plainest meal appetizing.

GOLDEN GRAINS.

Lyman Abbot compares doctrines with trellises, to which vines may cling if the vines be living.....

Ruskin says if you want knowledge you must toil for it: if food, you must toil for it; and if pleasure you must toil for it. Toil is the law. Pleasure comes through toil, and not by self-indulgence or indolence. When one gets to love work his life is a happy one..

Carlyle said that when he gazed into the stars, they looked down upon him with pity from their serene and silent space, like eyes glistening with tears, over the little lot of man. Thousands of generations, all as noisy as our own, have been swallowed up by time and there remains no record of them any more; yet Arcturus and Orion, Sirius and the Pleiades are still shining in their courses, clear and young as when the shepherds first noticed them in the plains of Shinar!.....

Marion Harland talks to mothers in a motherly way when she says that she who would be the mother of heroes, must bear herself heroically in their sight. Our little tempers, polite prevarications, lapses from the right, line of honor, or of Christian charity, our faults which are many, and our foibles which are legion—these tell for us upon our clear-eyed babies tenfold more powerfully than do the neat didacticisms we reckon as precept upon precept, the strong measures we classify as line upon line.....

The Germans have this good proverb, that thefts never enrich; alms never impoverish; nor prayers hinder work.....

It is said that the greatest pleasure is to do good by stealth and have it found out by accident.....

Beecher said that he loved little people. It is no slight thing when they who are so fresh from God love us.....

The reason, why so few men are made on a large pattern is that it is not safe to trust a man out in the world with large brains. There is a great economy therefore in that direction!

Colton says that, to look back to antiquity is one thing, to go back to it another. If we look back to it, it should be as those who are running a race, only to press forward the faster, and to leave the beaten still further behind.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

Ah, many a one is longing

And many a heart goes hungry
For something better than bread.
—JOSEPHINE POLLARD.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

"*Now is the accepted time*," not to-morrow, not next week, not any time but *now*, and that means the present moment.

Accepted time—what is it? The time to be taken—for what?

For whatever we have to do. If "procrastination is the thief of time," then *now* is the bolt that will prevent it from stealing the best from our lives. The Spanish "manana" "manana"—to-morrow, to-morrow,—expresses too often the unconscious thought that influences what we do, until, without realizing that we are doing so, we live out the motto—"Never do to-day what can be put off till to-morrow." And then we wonder how so much work could have accumulated.

There is no time but the present. *Now* is all we have. Yesterday *was now then*. To-morrow will be *now* when we come to it. But *this* moment is the *now* that should be the accepted time if we would have the best and most from life; and secure successful results in whatever we undertake.

When I was a girl, I found that procrastination and I were becoming too good friends for my good. I procrastinated in the most dangerous way—that of *thought*. Whatever I had to do or to learn, the unconscious tendency of my thought was this: next time I will do it better—next time I will learn it perfectly. But gradually I awoke within myself to realize that the next time never came for what had been neglected: other things demanded the *now* and unless I made *that* the accepted time for doing thoroughly what was my duty, my life would be a tangle of imperfections. Of course, I could not realize the importance of *now* as I

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

do to-day. My present convictions on the subject are the outgrowth of the experience and discipline of years. But if I have succeeded at all, in accepting *now* as *the* time of my life for whatever I have to accomplish, I owe it in a great measure to the example of my mother, who never procrastinated in any duty, and I hope she understands now how grateful I am to her. I believe that we must begin to accept *now* in our thoughts before we can show by our lives our appreciation of its meaning. Concentration of thought into the works of the present moment means life to us. Diffusion of thought results in worry and that means wearing out in an unnecessary way, sooner or later.

We have a task to perform. Instead of putting the mind into it *now*, and getting all the good we can from doing it well, we allow our minds to drift to other things. Our work is consequently half done and we are tired and dissatisfied, we know not why, all because *now* has not been the accepted time in our minds.

We feel depressed and miserable and think that *some time* we shall feel happy again. Why not be happy *now*? Isn't there just as much happiness in the world at the present moment as there can be at any future time? Isn't the unhappiness in our own thoughts? Why not make *now* the accepted time for facing about and smiling? Be like the old woman who thought on her mercies—because she had two teeth and they met. I often think of B. G. when he was a little boy in S. A. He had a violent temper and when unable to have his own way would throw himself on the floor and kick and scream. His mother talked with him about it and tried to teach him the meaning of self-control. He promised to control himself next time. But when the next time came and he could not do just as he pleased, he waited a second and then threw himself on the floor kicking and screaming in the usual way. When his mamma reminded him of his promise, he said: "I am not going to control myself *now*; I am going to wait till next time." The older we grow the more fully we shall realize that there is no next time; *now* is the accepted time. We are half listening to a conversation or a lecture or perhaps reading very hurriedly something that we should like to understand if it were not so much trouble *now*. Some other time will do as well we think, but before the other time comes some one may ask us the very questions we ought to be able to answer, but we cannot do so, because we did not make *now* the accepted time when we had an opportunity.

Men and women in this busy world often feel the absolute need of a little rest *now*, but they are perhaps anxious to finish some work begun, and, instead of saying, "I will rest awhile and then be able to work all the better for it," they put it off until they are obliged to rest on what is sometimes called "a bed of sickness." Fifteen minutes of rest *now*, when needed, is surely more economical than 15 days later on. A lady who retained her strength and youthful looks to a great degree, was once asked how she managed to keep in such good condition and she replied that every day she took ten minutes for absolute rest, and no matter what the pressure was in her family affairs, she would not allow her mind to dwell on the thoughts of anything that worried her. She dropped everything unpleasant from her mind. In fact, she tried to drop everything and become as nearly like an oyster as possible. In all that she did she took what she called short views of life; that is, she made *now* the accepted time and never had cause to worry. If some of the tired over-worked men as well as women, could adopt this into their lives, we should all be worth more to ourselves and each other, and our duties would not become such burdens. In his conversation last night Mr. Carman probably meant that a breakfast, dinner or supper was an accepted time to eat, not to talk.

There are so many places in life where now is the accepted time that it seems to be almost the hinge upon which our actions swing. The stitch in time that saves nine, means taking the stitch *now*. "Order is heaven's first law." Putting things away in their places *now*--not accepting any other time. A little book could be written called "Now" as a companion to "Don't."

Now is the time to be glad.
Now is the time to speak a kind word.
Now is the time to be polite.
Now is the time to be orderly.
Now is the time to be patient.
Now is the time for self-control.
Now is the time to be loving.
Now is the time to be brave.
Now is the time to get wisdom.
Now is the time to improve.
Now is the time to keep well.
Now is the time to be true.
Now is the time to be neat.
Now is the time to be earnest.

Now is the time to remember that the material things of this life are not lasting, and that our thoughts *now* are leading us either up or down, making us noble or unworthy for eternity. Therefore in all that we think, say or do, let us remember that now is the accepted time for all that is noblest and best in our natures.

Simple gowns—straight skirts, gathered waists, full sleeves—are growing in favor.

"DIAMONDS IN THE ROUGH."

MUCH generous praise has been bestowed on the class of mankind that come under the description of diamonds in the rough. I wonder if there is a diamond field in the world where cut and polished diamonds are picked up? And I wonder how much value would be placed upon a rough diamond if it were certainly known that all the work of the most skillful workman could never polish it or bring out any greater beauty than it chanced to possess in the rough state? There has been a great deal written about true hearts under rough exteriors, kind hearts behind rough manners, and a contrast has been made with the polished paste of false hearts under faultless manners, graceful selfishness, and there is truth in it; but it has led some to despise the true polish, that brings out in a diamond its great beauty and value. The Christian Union in an editorial, says: "We never value social training more than when we see people of broad sympathies and pure motives entirely misrepresented by their lack of manner."

Before any beautiful effects can be produced by drawing, a great deal of work uninteresting perhaps, tedious certainly, discouraging often, must be patiently gone through with. Before inspiring, invigorating social effects can be produced, a great deal of practice and training in the details of forms, with seemingly useless care, must be intelligently followed. Many insist that the spirit of kindness is enough, but if the well of brotherly love never failed it could not be understood at all times without its usual forms of expression. A man who declares that the spirit of the beautiful is all he needs to make him an artist, is no more foolish than the man who says a spirit of kindness is all he needs in society to make him an inspiring power there. In both cases the spirit is the great transcendent necessity, but can a man really possess this spirit in its strength and not be urged by its power to reach the needed forms, through no matter how much of drudgery.

A good workman appreciates good tools, and will not work without them if he can get or make them. It is the shiftless workman who hates his work, who does not care whether his tools are fit or not. Our manners are our social tools. They are no more politeness than a hoe is a clean garden, or than the plow is a mellow field; but it is easy to see the connection between them. In beginning an untried work the first question is naturally, what tools have others used in this work, and after faithfully trying the tools others have approved, and having grown skillful in their use, the workman has then reached the point where he can intelligently invent other tools for the work. If he has genius enough they will be better than the old ones; if he has not the genius, and is a wise man he will discard his own imperfect inventions and go back to the tools others have perfected.

Men may experiment in certain lines in social intercourse after mastering the forms long usage has proved good, but to cling to peculiar ways of their own, that are not agreeable or that fail to show the heart's kindness, limits the man's power as the use of a cradle in the wheat field limits the man who scoffs at the self-binder his neighbor uses.

Prof. Heber Holbrook, in an address on politeness to his students, giving them some of the well-tried laws of social intercourse, said: "Treat people in such a way as to put them at their ease; be respectful to others and they will respect you. Be appreciative. Irving needed applause to enable him to play well, an irresponsive audience cheats itself; so we cheat ourselves when we do not respond to the efforts of those who talk to entertain us. We must strive to acquire the power to make our neighbors comfortable. What man is going to be jolly, generous, attractive to you if you meet him with sour, insulting manners. The treatment we receive from our friends comes from our own actions. Those who are surrounded with friends do not think of self, do not struggle to be entertaining; they are thoughtful of the mind of their neighbor. We know ourselves that we can talk freely to a genial person when we cannot to others. We cannot sit stolidly and think the whole world is going to come to us. Expect the highest and keep expecting it, and give of your highest and best."

Will any one who follows these directions, forever remain a "diamond in the rough?" Appreciate the unpolished gems, weigh the paste at its true value, but do not deliberately reject all polish because some cannot tell the difference between a finished gem and worthless imitations.

Many men and women of the truest, kindest thoughts, give no pleasure to others in a social gathering, and get very little perhaps suffer keenly for lack of the polish they affect to disdain. The lack of such an entirely outside and superficial thing as suitable dress may make the wearer and his friends uncomfortable and mar their pleasure—destroy the very aim of the gathering. Dress should be so in harmony with the occasion that it will not obtrude unpleasantly upon any one's notice, least of all on the wearer's, and it may be safely forgotten. Such dress is the hight of comfort as well as elegance.

Such things as phrases, motions, harmonies of action and of dress, are only tools, but ought always be the most suitable for the social object in view. By their use the true "diamond," though "in the rough," will become the polished, cherished stone, or, better, will become the man or woman of ready, timely sympathy for grave, or gay, for trying occasions, and for the moments of overflowing fun and harmony in social intercourse at home and abroad. ALICE BROWN.

BLACKBERRIES were never more plentiful in Bergen County, N. J., and we are going to conserve some of the juice for medicinal purposes in this way: Put well-ripened fruit into a preserving kettle and place over a slow fire until the fruit is thoroughly scalded. Remove and when cool strain and press out all of the juice. Pass this through a flannel bag and to each quart allow a half pound of rock candy pounded fine. Return to the fire and simmer 15 minutes. When cold add a pint of the best brandy you can get to every three pints of the juice. Bottle and cork. Excellent for summer complaints.

THE CHRISTIAN UNION gives some excellent advice to the woman who is going to the country—whether farm-house or hotel—as to what she shall wear. It says that every year the fact is being recognized that the people who dress elaborately at the summer resorts are those who have limited social opportunities at home, or who are vulgar, consequently without a sense of the fitness of things, or who have recently come in possession of money that makes costly belongings possible.

It also sensibly says that it is a mistake for people of moderate means to concentrate all the resources of purse and taste on "dress-up" dresses. Common sense and refinement are on the increase among us, and laces and frills are things of the past, except for the vulgar and ignorant. Flannels, not laces, occupy the foreground, they give the stamp of social position.

ICE CREAM AT HOME!
Made cheaply and quickly by using a Triple Motion
WHITE MOUNTAIN FREEZER.

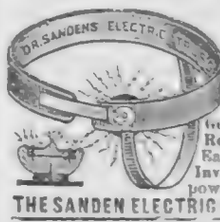
Will freeze in half the time of any other Freezer and produce cream of the finest quality. Inquire for the "White Mountain" of your local dealer in house-furnishing goods.
"Frozen Dainties,"
A book of Choice Receipts for Ice Cream, Sherbet, Water Ices, etc., packed with each Freezer this season, or will be mailed upon receipt of ten cents in stamps.
White Mountain Freezer Co., 134 Hollis St., Nashua, N. H.

Practical Hints TO BUILDERS.
A LITTLE BOOK of 100 pages containing solid facts that every man contemplating BUILDING should know before letting his contracts. Short chapters on the kitchen, chimneys, cistern, foundation, brickwork, mortar, cellar heating, ventilation, the roof, and many items of interest to builders. Mailed free on receipt of 10c. in postal stamps
Address National Sheet Metal Roofing Co.,
510 East Twentieth Street, New York City.

EPPS'S
GRATEFUL—COMFORTING.
COCOA

GOLD MEDAL, PARIS, 1878.

W. BAKER & CO.'S
Breakfast Cocoa
Is absolutely pure and it is soluble.
No Chemicals
are used in its preparation. It has *more than three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup.* It is delicious, nourishing, strengthening, EASILY DIGESTED, and admirably adapted for invalids as well as persons in health.
Sold by Grocers everywhere.
W. BAKER & CO., Dorchester, Mass.



RUPTURE
Can be CURED by DR. SANDEN'S Electric TRUSS
Warranted Best Truss made to CURE all Curable cases or Refund Money. Only Genuine Electric Truss in World. Perfect Retainer, Gives instant relief, speedy cure Ease and Comfort day and night. This New Invention combines science, durability and power. Price $3 & $5. Illus. pamphlet free.

News of the Week.

HOME NEWS.

SATURDAY, July 20, 1889.

AFTER a long silence General Master Workman Powderly is out in a long letter bitterly scoring President Corbin, of the Reading Railroad Company, for his course in preventing members of labor organizations from obtaining employment at the Reading Works. He earnestly urges the absolute necessity of ballot reform in the Keystone State as a prerequisite to legislation doing justice to the rights of all sorts of labor against the workings of unscrupulous capital... .The Knights of Labor, whose organization has been losing a great many of its members of late, is going to make an effort to revive interest in its proceedings by holding a mass convention soon... Last Wednesday at the Labor Congress now in session at London, England, the American, English, Belgian, Spanish, French, Danish, Polish, Austro-Hungarian and Portuguese delegates agreed upon a series of resolutions declaring in favor of eight hours as the maximum per diem, a holiday weekly, the suppression of labor for children under 14 years, equal opportunities and wages for the two sexes, etc..... During the past year there has been a very considerable decrease in the number and importance of strikes in this country, whereas the reverse has been the case both in the British Isles and on the continent. Bradstreet's tells us that since January there have been reported 266 strikes, involving 75,110 strikers, against 389 strikes and 111,501 strikers in 1888, and 511 strikes and 212,317 strikers in 1887... ....The vast increase in labor-saving machinery is the chief ground on which the operatives everywhere base their claims for shorter hours. Recent German statistics show that four-fifths of the steam machinery in the world has been constructed within the last 25 years. Full details are given of the steam power in each country of the world, and the conclusion arrived at is that all the steam machinery possesses 46,000,000 horse power. Then it is calculated that the one-horse power of a machine operated by steam is equivalent to the strength of three ordinary horses, and the strength of an ordinary horse is equivalent to the combined strength of seven men. From all this the Statistical Bureau at Berlin draws the conclusion that the steam machinery of the world does the work of 1,000,000,000 men, or twice the working population of the globe. No account is here taken of the tremendous amount of wind-power or water power employed for industrial purposes in the world. Workingmen insist that they should derive some advantage from this enormous substitution of steam power for human labor..... The inhabitants of the Conemaugh Valley, and especially those of Johnstown, have been almost turbulently indignant during the week at the tardiness with which the generous contributions of the country have been doled out for the relief of the needy by the State Flood Commissioners. So far as can be reasonably calculated, $3,500.000 have been contributed in cash through the official receiving centers. Governor Beaver secured what was needed of $1,000,000 more to be used in clearing away the wreckage for sanitary reasons. The Governor values the clothing and provisions sent direct from the donors to the sufferers at $600,000. Large cash contributions have also been distributed by the Odd Fellows, G. A. R. Posts and other associations among suffering members of their own organizations. The total loss of the property in the valley is now estimated at only $9,500,000. Most of this was lost by the Cambria Iron Works and other wealthy companies or individuals who will hardly expect any of the fund. The ordinary sufferers therefore ought to be financially better off after the flood than they were before. Half a million dollars were distributed by checks yesterday to those who needed the money most, and about $1,500,000 more still remain at the disposal of the State Commissioners. The cash distribution is expected to revive business throughout that section as the recipients will be in a position to make purchases and enliven trade..... ..... A Skewer Trust and a Tooth Pick Trust are among the latest.....It is reported that the Government is about to transfer Geronimo and the Apache prisoners in Alabama to the Onalla Reservation in North Carolina—a better plan than to send them back to the demoralizing influences of their old home..... Mayor Cregie of Chicago, has, very properly, nullified the folly of the aldermen in giving for 25 years, to the Standard Oil Trust, the exclusive privilege of running a pipe line through a thoroughly built up and populous section of the city, which would be a continual threat of another conflagration ..The Delaware Breakwater, at the mouth of the Delaware, which has cost the United States millions of dollars, has been declared a failure, and steps are to be taken to have a better harbor made there, at a cost of not less than $5.000,000..... On his way North from New Orleans, triumphant Slugger Sullivan was arrested at Nashville, Tenn., on a telegraphic request from Gov. Lowry, of Mississippi, but was presently released by a Nash. ille Dogberry whose decision was utterly inexcusable, as ignorance of law is no excuse in a judge. Since then both Boston's Pride and Baltimore's Pet, together with their seconds, have been dodging requisitions from the doughty Governor who says he will use his best efforts to punish them and their abettors for violating the laws of his State. He also threatens to take measures to secure the forfeiture of the charter of the Queen and Cresent Railroad for aiding in bringing about the fight. His efforts are worthy of all praise; but half the official fuss would probably considerably lessen the number of murders and other outrages committed every year by pisto., shot-gun and rifle in Mississippi. But, then, the fist is there the blackguard's weapon, the pistol or knife, the gentleman's..... ..... An English syndicate is negotiating for the purchase of the distilleries of Kentucky. Those only that make Bourbon or aging whiskeys are wanted.....The State officers of Indiana have succeeded in negotiating the sale of the $3.900,000 of bonds issued for the purpose of refunding the school fund loan. It is stated that New York capitalists have been found who were willing to take the paper.... ... . Postmaster-General Wanamaker wants to fix the payments for the transmission of government official telegrams during the fiscal year 1890, at one mill per word for all classes of messages, instead of an average of one cent per word hitherto paid. In telegraphing the Signal Service reports alone this would make a difference of $114,-000! Congress appropriated for the work $118,000, but under the new rule it would amount only to about $4.000—or one-thirtieth of the appropriation. Jay Gould's Western Union would, of course, be the chief loser. It appears, however, that it has been doing business for favorite private parties for one mill per word. The government gives very important privileges to the telegraph companies, and the law requires that the government messages shall have priority over all other business, and the lowest rates, in return. The wires of the telegraph companies run into every newspaper office in the country, and the general opposition to the proposed government retrenchment shows that the managers well know what wires to work..... Last Sunday three of the pulpits of Charleston, S. C., thundered against the infamy of murderer McDow's acquittal. At a recent union of the Protestant clergy of the city the aid of the pulpits in the city and throughout the State was invoked to put down such deeds of criminal violence, and the warfare is to be kept up. McDow expected the people would soon forget or condone his "little indiscretion;" but the rascal may find that the citizens of South Carolina are not so lost to all sense of justice and decency as he imagined.....The troubles at Carnegie, Phipps & Co.'s iron works at Homstead, Pa., were compromised a week ago; both sides having made concessions. Had the settlement been delayed, it is probable that the bloodiest labor riot ever known in this country would have occurred, as 10,000 armed workingmen from Pittsburg were ready to march to Homestead to drive off all scabs, and "kill off Pinkertons," as a strong gang of Pinkerton men had been hired to protect Hungarians and others willing to take the places of the strikers..... Far up the St. Lawrence, in the village of Seeley's Bay, tyrotoxicon in ice-cream prostrated 200 church picnickers a week ago, four of whom have died. Ice-cream at festivities seems outrageously productive of this lately discovered poison.....The whole number of officials now protected by the civil service rules is 27,597, of which number 8,212 are in the departmental service, 2,298 are in the customs service, 11,767 in the postal service and 5,320 in the railway mail service.... ..... What an extraordinary number of cloud-bursts there have been this year, with disastrous results always to property and often to life. Few parts of the country can hitherto complain of drought; while many have ample cause to complain of too much rain..... Heaps of testimony are still being taken in this city before the referee in the electric-execution investigation and the more testimony taken the more conflicting it becomes and the harder for anybody to analyze it and come to a decision in the matter. It is lengthened out by the efforts of rival associations interested in the use and manufacture of electric devices.....In spite of frequent denials, the organization of that Salt Trust is now virtually complete. It's to have a capital of $20,000,000, of which $5,000,000 are to be held openly by Englishmen, who will no doubt quietly buy up most of the rest. The stockholders in the English Salt Company at home, have been notified that they have the first chance to invest in the American enterprise which owes its organization to the managers of their own monopoly. All the large salt works in this country are in the "pool," and the rise in the price of salt is to start at $1 per barrel..... F. J. Seymour, manager of the American Aluminum Company, died suddenly of paralysis at Findlay, Ohio, the other day, carrying with him to the grave the secret he had discovered of extracting aluminum from clay. Most of the details of the process were patented; but the most important point of all—the employment of a chemical process at the critical moment—was kept a secret by the inventor. President of the company Gen. Alger of Michigan, and its vice president Senator Palmer, together with the other stock-holders are in a pickle. The works have been compulsorily stopped, as nobody knows how to run them. Investments in blind-pools are always mighty risky..... Sir Julian Pauncefote, the new British Minister at Washington, is becoming extremely popular owing chiefly to his sound common sense and ordinary-good-natured-citizen manners.. A bogus announcement that Secretary Blaine was certainly about to resign from the Cabinet, ostensibly on account of ill health, has greatly helped the papers to fill their columns with denials, reiterations, re-denials, and editorial comments during the week—no unwelcome boon during the "silly season," when legislatures are not in session and other sources of "copy" are uncommonly scarce. Indeed nearly half the "news" in the papers nowadays consists of bogus domestic and foreign announcements to be followed by denials, etc , etc.....The Carpenter Type-setting Machine Company has just been incorporated under the laws of Illinois, with a capital of $1,000,000. Its wonderful machines threaten to drive most of the compositors out of all the printing offices in the country, as the new machines, it is said, can do their work faster, cheaper and—as well..... The circulating medium decreased $17,000,000 in May, and the same in June, but there are $8,000,000 more in the hands of the people than there was a year ago, and $63 000,000 more than there was at this time in 1887..... .....Politicians are regarding with interest and curiosity the conventions of the four new States to form constitutions. At the last elections 164 Republican and 161 Democratic Representatives in Congress were elected. One Democrat who has since died will be succeeded by another. The new States will elect five Representatives, all probably Republicans, except possibly the one from Montana. These with those who may take the place of some Democrats who will probably be unseated by the majority, will give the Republicans a "working majority" in the Fifty-first Congress..... It is stated that an English syndicate has nearly completed the purchase of the great flouring mills at Minneapolis, and also of those at Milwaukee and St. Louis, and is negotiating for the transfer of mills at various other points. It is also said that another British syndicate wants to purchase, for $5,-000,000, Warner's proprietary medicines at Rochester, N. Y. There are also reports of several other English syndicate enterprises here. It is estimated-that $1.000,000,000 of English capital is now invested in this country and that the interest takes abroad $100,-000,000 a year. A large share of English capital invested here, is, however, a total or partial loss, and a good deal more is, for the present at any rate, unproductive. Americans are quite willing that Englishmen and other trans-Atlantic speculators should invest all the money they please here, confident that, in the long run, American shrewdness, enterprise and (often) unscrupulous business tactics will get a fair share of it..... A School Book syndicate composed of all the chief school-book publishing houses in the country, went into force on July 15, when all the traveling salesmen were withdrawn, leaving the sale of school books to be conducted entirely by the producing centers. The syndicate now consists of Van Antwerp, Bragg & Co., and Clark & Maynard, of Cincinnati, Harper & Bro., D. Appleton & Co., Ivison Blakeman & Co., Taintor Bros. & Co., and Ginn & Co., of New York, and the J. B. Lippincott Company, the Christopher Sower Publishing Company, Cowperthwaite & Co., Porter and Coates, and E. H. Butler & Co., Philadelphia. The principal source of their additional profits, will, they say, be the savings made by dispensing with traveling agents. Each firm employed from 15 to 50 of these all the time, and their salaries ran from $1,800 to $3,500 a year besides traveling expenses. It is said that they also spend a great deal of money in "treating" and bribing school trustees in order to secure sales. As all the houses guarantee not to cut the prices of books under certain specified figures, there is little doubt that the syndicate will soon place a thumping tax upon learning even the alphabet..... ..... The officers of the Southern Cotton Oil Company very emphatically deny that their organization has been absorbed by the Cotton Oil Trust. Their Company, they say, is entirely independent and will remain so..... Friends of Senator Washburn of Minneapolis, indignantly deny that he is or has been financially embarrassed. He's all right and has lately sailed for a trip to Europe with his family. As soon as he left his enemies meanly and maliciously spread abroad circumstantial but mendacious reports that he had been saved from utter financial ruin only through the generous interposition of friends.....The grain elevator men of Minneapolis are gnashing their teeth because the city assessor has assessed 8 000,000 bushels of wheat in the elevators. This was never done before. The elevator men claim that the wheat receipts change hands so often that it is impossible to charge the assessments to the right parties. If they can't make these pay, they're sure to saddle the loss on the public by elevating charges..... While the capital and manufactures of New England are constantly drawing heavy profits from every other part of the country, recent statistics show that that section annually buys from the producers of other sections 550,000 tons of grain, 525,000 tons of flour and $50,000,000 worth of meat. It also affords a market for 50 per cent. of the wool product of the country, and for 25 per cent. of the cotton crop. Can any section of the country be really an enemy to any other section ?.... . ..... The Rhode Island Legislature has just met in special session, to enact a license law. The bill puts the wholesale license fee at from $500 to $1,000, the amount to be determined by the License Commissioners. The retail fees run from $400 in Providence down to $250 in smaller towns, according to population..... ..... There's a project on foot for combining all the railroads in a mighty "trust," as the only certain remedy against destructive freight rates warfare in future, and the surest method of wringing from the public big interest on the capitalization of the roads, whether money or "water." It is proposed that the railroads be united in "territorial groups" which again are to be placed under the management of a central board of trustees. In theory the new organization would give to the public the best service at the least cost; while the stockholders would be saved from depreciation of their securities by excessive multiplication of competing lines and ruinous rate-cutting wars. The great obstacles to such a happy consummation are the gambling and intrigues of the inside railroad rings of presidents, diectors and managers, who speculate with the property committed to their care regardless of anything but their own greedy interests. These "wreckers" treacherously and often fraudulently raise or depress the stocks by their reports and rate-cuttings to suit their own ends, and so long as the projected organization is likely to hamper their manipulation of the roads under their control for their own interests, there is little chance of a Railroad Trust. Under the present arrangements hundreds of "wreckers" have splendid opportunities of legally but unscrupulously pocketing the money of others; under a great trust a few great magnates would have wider opportunities of doing so, but the general crowd would be shut out..... The British-American Association of Massachusetts in session at the Hub, fulminates bitter denunciations against Patrick Egan, Minister to Chili, because he is an Irishman suspected by some Englishmen of complicity in the atrocious Phœnix Park assassinations; against President Harrison, for his shameful subserviency to the Irish, shown by appointing Egan; and against Governor Thayer, of Nebraska, for his official insolence, thick-skinned ignorance and gross presumption in venturing to berate members of the association. Thayer's conduct "has caused the name of American citizen to stink" in the metaphorical nostrils of these "British-Americans.".....

The Way Out.

WE have discovered a way out of the narrows. We want to say a great deal about Compound Oxygen, but there is neither the space provided nor the time.

So we will trust to your sagacity to catch the saving suggestions embodied in the following:

JONESBORO, Tenn., June 4, 1888.

About six years ago I had a number of hemorrhages, followed by fever, great exhaustion and nervous prostration; had but little appetite and much insomnia. I was led to try your Compound Oxygen. The hemorrhages ceased, appetite returned, slept well and general health became better than it had been for years. REV. C. A. DUNCAN.
Pastor of Presbyterian Church.

COLUMBIA CITY, Ind , Mar. 19, 1888.

"It is about three years now since I used the treatment to such good purpose for catarrh, and I find it has not lost its value in the least."

HENRY C. MCLALLEN.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, July 20, 1889.

SIR CHARLES RUSSELL and Mr. Ackworth, the two chief lawyers for the defendants before the Parnell Commission, have withdrawn from the case together with Mr. Parnell, on the ground that it would be folly to expect an impartial decision from that tribunal appointed and selected by a bitterly partisan government for partisan purposes. The Court ordered that all the books of the Land and National Leagues and even the private bank-books of Parnell and some of the other defendants should be produced in court and submitted to the scrutiny of the Times Government lawyers, and the order was obeyed. Then the Parnellites insisted on the production of the books of the Loyal and Patriotic League on the ground that they would show that a wicked conspiracy had been concocted by its members to bribe Pigott and other witnesses against the Parnellites to commit forgery and perjury to ruin the reputation and influence of the Irish leaders. The Court decided against them, and their immediate withdrawal from the case virtually involves the collapse of the investigation, though it is still carried on in an uninteresting, one-sided fashion. Many insist that Parnell and his followers should have withdrawn immediately after the exposure of Pigott's forgeries and perjuries, and there is little doubt but that would have been the best move. The Commission was organized on September 17, 1887, and the case was opened on October 24. Ten months have been occupied with testimony and argument. A decision against the Parnellites on several counts at least, is a foregone conclusion, but it will be like the whistling of the wind through the broken rigging of an abandoned hulk on the ocean—nobody will pay much heed to it..... The English are concentrating a considerable force in Southern Egypt, under General Grenfell, Commander-in-Chief of the Anglo-Egyptian forces. Nad-El-Jumi, the Dervish leader, says he has been sent by the Mahdi's successor to conquer the world, and he has about 3,500 brave, reckless, ill-disciplined and ill-armed troops and about 2,000 ragged camp followers to do the little job. They are still pressing northward in parallel lines with the Egyptian troops and gun-boats along and on the Nile.....The marriage of the Princess Louise, eldest daughter of the Prince of Wales, to the Earl of Fife, is to take place on July 27, at Buckingham Palace, London. The Earl has been made a Duke. Instead of making special grants for the children of the Prince of Wales on their marriage, as hitherto proposed, Parliament will increase the Prince's allowance by $200,000 per annum so as to enable him to provide marriage portions for his children .... On June 2, the bursting of water-spouts and terrible tornadoes flooded a wide district in Northwestern China, overwhelming nine villages and destroying 6,000 people. The water

Miscellaneous Advertising.

This Threshing-machine received the two last **Gold Medals** given by the New York State Agricultural Society; and has been selected, over all others, and illustrated and described in that great work, "Appleton's Cyclopedia of Applied Mechanics;" thus, establishing it as the **standard** machine of America. **Straw-preserving Rye-Threshers, Clover-hullers, Ensilage-cutters, Feed-mills, Fanning-mills, and Wood Saw-machines;** all of **the best** in market. The **Fearless Horse-powers** are the most **economical** and **best** Powers built for the running of Ensilage cutters, Cotton-gins, and general farm and plantation use. For free Catalogues, address
MINARD HARDER, Cobleskill, N. Y.

is reported to have been 36 feet deep on the level country! Several great floods have been very disastrous to life and property among the teeming population of China of late. The last calamity, however, is trifling compared with the flood which wiped out 100,000 lives along the Yellow River in September, 1887.... ..A Beet Root Syndicate Bank is to be founded at Brussels, Belgium, with a capital of $15,000,000 and branches and agencies in all the principal cities in the world. It will do no speculative business, but will sell sugar on commission and make loans to manufacturers of beet sugar and also furnish them with news concerning the sugar markets everywhere ..... There's considerable talk about the Pope's leaving Rome and finding a refuge in Spain, hoping for the restoration of the temporal power of the Papacy should Italy be crushed in a general European war. The "temporal power" was first firmly established by Charlemagne in 744. During the troublous times between 1309 and 1377, the residence of the Popes was changed from Rome to Avignon, a town in Provence, southeastern France, now possessing about 40,000 population. Since then the official residence of the Popes has been at Rome except for short intervals. Eugenius VI. was driven out for seven months by a popular insurrection in 1433. Pius VI. was taken prisoner to France (where he died) by Napoleon in 1798, and his successor Pius VII. met the same fate in 1809, and did not return till 1814. Pius IX. escaped from the city in disguise during the revolution of 1848, and remained away nearly a year. The temporal power was abolished 1870 by the occupation of the city by the Italian troops on the withdrawal of the French garrison to take part in the Franco-Prussian war. Though without much material power, the Pope's influence is still tremendous among the 250,000,000, Catholics throughout the world..... The Czar has decreed the total suppression of the Lutheran Church in Russia. There are upwards of 3,000,000 of Lutherans, mostly, if not all, of German parentage, special protégés of the German government which has frequently intervened in their favor. They occupy the western and northern provinces of the empire and pray heartily that they may soon become German subjects. Intense indignation, of course, in Berlin..... The sad but glorious fate of the late Father Damien, the leper martyr of the Sandwich Islands, has roused public attention to the growing prevalence of leprosy in England, to which it is brought from China, British India and other Eastern countries. A leper ward is to be opened in London, and provisions are to be made for the outcasts in other parts of the Kingdom. A meeting presided over by the Prince of Wales, the other day, resolved to erect a fine memorial to Father Damien at Molokai, the barren little island set apart as a leper settlement in the Sandwich Islands..... Tuesday last a Portuguese crank harmlessly shot at the popular, progressive and liberal-minded Emperor Dom Pedro of Brazil. The final abolition of slavery in the Empire went into effect last year, and contrary to the fears of the timid, the freedmen have kept the peace and have been diligent in doing the work for which they were paid on the plantations. Emancipation there was as much of a bugaboo in 1888 as it was here in 1863.....

FIVE HARVEST EXCURSIONS.

THE Burlington Route, C., B. & Q. R. R., will sell, on Tuesday, August 6th and 20th, September 10th and 24th, and October 8th, Harvest Excursion Tickets at *Half Rates* to points in the Farming Regions of the West, Southwest and Northwest. Limit 30 days. For circular giving details concerning Tickets, rates, time of trains, etc., and for descriptive land folder, call on your ticket agent, or address P. S. EUSTIS, Gen'l Pass. and Ticket Agent, Chicago, Ill.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, July 20, 1889

IT seems that a person may be presented with an article, and yet not receive it. Secretary Rusk says that he will not receive the horse recently presented to him, and that he would not receive any present from any body. We need more of this kind of public officers. ..... A Massachusetts inventor has patented a method of baling silage.....California fruit-growers are experiencing considerable difficulty in securing necessary help to gather and dry their fruit at a price which they can afford to pay. Chinese labor has proved the best as well as the cheapest in the past, but this is getting scarce, and a higher price than formerly is demanded ..... Robert Bonner, the dispatches say, has offered $65,000 for Axtell, the three-year-old stallion that trotted the Minneapolis track in 2:15½ the other day, and a Chicago man, acting for unknown capitalists, has supplemented this offer with one of $80,000, both propositions having been refused. The owner of Axtell is C. W. Williams of Independence, Iowa. The horse was sired by William L., a son of George Wilkes. Axtell made a record of 2:23 as a two-year-old, the best record ever made by a stallion of his age, and which created a great sensation. The West seems to be coming to the front in horse-breeding ..... Professor H. M. Wiley, Chemist of the Agricultural Department, has recommended to Secretary Rusk the appointment of the following persons as assistant chemists, to be assigned during the fall to duty at the sorghum sugar experiment stations: T. F. Sanborn, New Hampshire; Ervin E. Elwell, Michigan; Lewis H. Bradford, S. B. Merrill and M. C. Meachem, Kansas. Professor Wiley will come to New York next week to secure apparatus for the new sugar stations established this year by Secretary Rusk..... .....Secretary Hunt, of the New Jersey State Board of Health, has telegraphed Secretary Rusk that the latter's protest against the raising of the pleuro-pneumonia quarantine by the State authorities would receive immediate attention..... Our Scotch exchanges report large sales of Clydesdales for exportation to the Argentine Republic, as well as to the United States. The first sale of new wheat of this crop was made last Saturday at the Produce Exchange. The lot of 100 bags was raised in New Jersey, and brought 95 cents a bushel.....Santa Barbara County, California, claims a grape vine of immense proportions. The circumference of the trunk six inches above the ground is six feet two inches. It is seven feet high, and the main trunk is divided into branches which are trained on an arbor, and extend 110 feet one way and 90 feet the other. The annual yield of grapes from it averages four tons. Another big vine is on the Machado ranch, 19 miles southeast of San Diego, near the Mexican line. It is of the old Mission variety, and was planted in 1850. From the roots a trunk five feet in circumference reaches up about six feet, where it divides into three large branches which in turn divide and send out other branches, twined over an arbor; the whole vine covers something over half an acre of ground. This immense canopy of vine and fruit is within easy reaching distance of the ground. The average yield is from three to four tons of grapes.....

Anyone having a second crop of hay to cut, especially clover, should have Symmes' Hay and Grain Caps. Manufactured at Concord, N. H., by the Symmes' Hay Cap Co. Price, $37.50 per 100.—*Adv.*

Market Notes.

SATURDAY, July 20, 1889.

FREQUENT reference has been made in these columns to the supply of California Fruits in this market. A visit to one of the auction rooms where this fruit is distributed with bewildering rapidity is both interesting and instructive. To such a science has railroading been reduced, that the exact time of the arrival of the cars direct from the place of shipment, 3,000 miles away, can be foretold. The consignees advertise the time of sale, and the articles to be sold. The loaded cars reach the docks in New York the same morning, the contents are overhauled, samples are taken of each lot, the condition is noted, any bruised or "wets" are parceled out by themselves, and the samples are opened and displayed in the auction room, each lot being labeled and numbered.

Catalogues of the different lots by number, together with their marks and description are in readiness before the sale. As the prospective buyers examine the samples, each marks upon his catalogue the price he thinks the goods are worth. When the hour of sale arrives, all are ready; if the auctioneer be one minute late, cries of: "Time!" are heard, so thoroughly do these men realize that time is money. The auctioneer mounts the platform; no time is spent in praising the quality, or in useless talk; the goods have all been examined, and each man knows exactly what is what.

The choice of several lots of Royal Apricots is offered, the lots contain generally 50 boxes, sometimes less. The start is slow, and low. No one seems anxious to raise the price, and the first choice sells at the lowest price of any of the 800 boxes. The buyer is entitled to his choice of any of the lots offered, or to 20 boxes of any lot, not less than 20 boxes being sold unless a lot should contain a smaller number, which sometimes happens. The remainder of the lots is disposed of in the same manner, and then several more lots are grouped together in the same way. The auctioneer with an eye like a hawk's and with a tongue you might readily believe had more than the proverbial two ends to it, sees every motion and every suggestion of a bid, and is ready to profit by it.

Truly, selling the fruit is as much of an art as growing it, and a proper division of labor should be to the advantage of all.

Next, first choice of several lots of Bartlett Pears was offered, and these were disposed of the same as the apricots. Then a lot of German Prunes, Magnum Bonum, Purple Duane, Washington, and Peach Plums were sold, after which the samples, and a few boxes of "wets" and "bruised" were offered. About 800 boxes of Royal Apricots were sold, the price ranging from 60 cents to $1 50 per box. The Bartlett Pears ranged in price from $2.80 to $3.50 per box, about 350 boxes being sold. Thirty-nine boxes of Peach Plums brought $4.60 per box, while the sample box sold for $4.45. There were 88 boxes of German Prunes, which went for $1.90 per box, the sample box bringing $2.10. A dozen crates of Magnum Bonum Plums sold for $2.15 to $2.55 per crate, while 100 boxes of Purple Duane Plums brought from $2 25 to $2 60 per box. Thirteen boxes of Washington Plums sold well, bringing $3.40 per box, the sample box selling for $4.05. The goods are sold on 10 days' credit, the purchaser paying cartage.

The sale of this entire lot, comprising two car-loads, occupied just one hour. A striking feature of the crowd present was the number of Italians, many of them buying heavily.

These sales are of weekly, and sometimes almost daily occurrence, and are a popular and successful means of handling fruit rapidly and satisfactorily.

THE live stock market at interior points was not very active, and prices ruled somewhat lower, excepting for sheep, which show a continual, steady advance. Wool has also maintained a firm price, and shows an upward tendency. Prices are considerably higher than at this time last year. From present prospects, the prices of grain are likely to be well maintained, especially for wheat and corn. The best quality of hay is likely to bring good prices. Best grades of butter sell readily, but the market is over-stocked with poor trash. Eggs are plentiful.

Literary.

MAGAZINE REVIEWS.

THE recent death of Father Damien in the Sandwich Islands, concluded a life of heroic self-denial and devotion, which has seldom, if ever, been excelled or equaled. In the century from 1778 to 1878 the population of the islands dwindled from 100,000 to about 44,000, and much of the decrease was due to that dreadful disease, leprosy. In 1865, the Hawaiian legislature ordered the removal of all lepers to the island of Molokai, where they were left to their own resources. Without hope, with little food or shelter, these miserable outcasts abandoned themselves to the wildest excesses. At this point, Father Damien, a Catholic priest, then a young man of 33, requested permisssion to go and live among the lepers. Among these wretched beings, he has since lived and labored, acting, as he himself wrote, as "physician of the soul and body, magistrate, school-teacher, carpenter, joiner, painter, gardener, housekeeper, cook, and often undertaker and grave digger." Thus he labored until released by death, dying himself of this loathsome disease. This, in brief, is the story told in July Lend a Hand, a Record of Progress and Journal of Good Citizenship, by Mrs. Bernard Whitman. It also contains a report from the Massachusetts Society for promoting Good Citizenship; extracts from "The Spirit of Laws;" a sketch of John Frederic Oberlin; an article on "The Rights of the Child;" "The Midgton Library, A True Story," and much other matter that is calculated to help in making the world better. The editor is Edward Everett Hale, D. D., and the publishers J. Stilman Smith & Company, Boston.

BOOK REVIEWS.

THE GARDEN'S STORY, or Pleasures and Trials of an Amateur Gardener, by George H Ellwanger, is a recent addition to floricultural lore. It relates entirely to the flower garden, and is written by a professional who has evidently had access to a well-stocked library during its preparation. This may account for his somewhat ornate style, which is hardly in keeping with the subject. Still there are many good things in it, for which we may possibly forgive the author his rather free use of foreign words and phrases, which sometimes cannot fail to render his meaning obscure to the ordinary reader. The book starts with the earliest hardy flowers and plants of spring, and follows the ever-changing procession till it closes with the blue monk's-hood, the last to be stricken down by the frosts of autumn. Mr. Ellwanger gives as a garden maxim a trite, old truism that is applicable in any garden, or on any farm—"whatever is worth doing at all is worth doing well." There are none too many books of this character, and any additions of merit will receive a welcome. D. Appleton & Co., New York.

A PHILOSOPHER IN LOVE AND IN UNIFORM, is the title of a small, paper-covered novel, by the authors of "Napoleon Smith." It is a reminiscence of the Civil War and furnishes some interesting summer reading, though some parts of it are rather exciting for hot weather. The Judge Publishing C., New York.

For the Young.

NOTES BY THE WAY.

OMAHA, Douglass County, Neb.

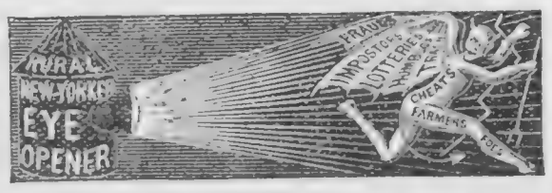
Dear Uncle Mark:

FOR many years I have held the position of mailing clerk on the R. N.-Y. It was my duty to see that each one of its thousands of subscribers received his paper regularly each week from Maine to California. This was no small job, and required close attention to business. To have Samuel Brown of Oklahoma receive his paper each Friday night, was my duty, and how many thousands of Samuel Browns you have got! In Nebraska (a very fine farming country) I always observed you were well represented, and one day I made up my mind to take the advice of that venerable sage "Greeley" and "go West." Nebraska being the State I desired to locate in, I left New York on one of the principal railroads for Chicago. All night long we were in New York State asleep, all but the engineer and trainmen. They, like detectives, never sleep. The morning cast its gray light on us near Jamestown in Chautauqua County. This is a fine farming section as well as I could judge from my car window. The fences seemed to me very funny. Look at those up-turned stumps all in a row. The conductor informed me that nearly all the farmers in that county fenced in their property in this manner. My only reply was "Oh"! So much for being a city lad. I was wondering what I would see next that would surprise me. Were I to see a dairymaid pumping water into a milk can and mixing in plenty of chalk, I would have given the performance no thought. I would have turned over and gone to sleep again. We next flew through a narrow strip of northern Pennsylvania, before passing into Ohio. Our road took us through the northern part of this grand State, great in many industries, but especially in agriculture. We passed through several large manufacturing towns and cities, and I was much interested in reading the signs on big establishments and factories whose advertisements I have seen so many times in the RURAL. I cannot give a good description of these towns, for one can hardly judge correctly of a place by its looks around a railroad station. I was much disappointed with what I saw of the State of Indiana, but perhaps it grows better away from the railroad line. It was very late when our train arrived at Chicago, the Windy City, which deserves its nickname. One can wear a clean pair of cuffs and a collar in Chicago only one day and then they are ready for "Wah Sing", the laundryman; while in New York with ordinary care the limit is three days. Many parts of Chicago are very smoky because there are so many mills and factories, but I liked the town. A resident asked me how I liked it. "My Dear Sir," said I, "I think it far ahead of New York." "Why, I thought you were from Gotham," said he. "So I am," I replied; "but I am honest when I say that Chicago is far ahead of New York." Do you ask why, dear Uncle? Ask a man in your town: "How can I get to Wall Street?" The answer will be: "Walk five blocks"—a very definite answer truly. In Chicago, on the other hand, they tell you very politely where and how to go. The public buildings, stores, hotels, parks, drives, private homes far exceed those of New York. State, Dearborn, and Clark Streets are the Broadways of the city. I was loath to leave the town, but my goal was farther west. I landed at last in Omaha. I was much pleased with the State of Iowa through a very beautiful part of which I traveled. I am not surprised that the RURAL is so well represented there. I was struck with the fact that fertilizer men would make a poor living doing business here in the West. I was reminded of the cartoon in one of the issues of the RURAL a couple of years ago, representing the ghost of the exhausted fertility of the old Eastern States, which threatened to extend, in the near future, its baleful influence to these lusty young States of the West also.

All crops hereabouts are in a flourishing condition, especially corn. I never saw such corn fields as in Iowa, and Nebraska; the Eastern farmers are nowhere in this respect. Omaha is a very beautiful city, full of life and push and it is growing rapidly. It has excellent newspapers, and many fine public buildings.

Your nephew,

GEORGE T. MOREY.



Many innocent farmers have been swindled in various parts of the country of late by gangs of slick sharpers who practice the same game with several variations in the details. From an account of the tricks of one set, however, those of the others can be easily learned. Take, for example, the case of a number of farmers in Bucks and Huntingdon Counties, Pa., who have lately been swindled pretty heavily by a gang of gentlemanly-appearing rogues. Having reconnoitered the ground beforehand, one of the gang drives up to a farmer's house, and requests permission to store in the barn a number of pitch-forks, which he says are of superior quality. Permission having been granted, the farmer is told that the forks comprise the last of a large consignment, and will be sold at very low figures to close the transaction. A tempting offer is then made to the farmer of 50 per cent. commission on all sales made by him while the goods are temporarily in his charge, and a long agreement, most of which is in fine print, is next produced. The agent alleges that it is merely a stipulation with regard to the commission, which is for the safety of the farmer and the satisfaction of his own principals. He asks the farmer's signature as a mere matter of form, and often the farmer gives it without taking the trouble to read the paper carefully. That bit of careless neglect is sure to cost him from $100 to $500, however, for he soon learns that he has signed a contract to buy a lot of worthless forks at exorbitant figures. Some substitute plows, churns, or other farm devices for forks; and with these exceptions the game is played in substantially the same way in all cases, and it really wonderful how often it is successful.

CONCERNS CENSURED.—Under this head the Eye-opener, will, from time to time, give the names of concerns he has seen denounced in other papers, but which have not been investigated from the RURAL office. The New England Shoe Company is advertising pretty liberally in country papers; but the Chicago Farm, Field and Fireside does not feel justified in recommending it.....The Grarman Detective Agency, Cincinnati, Ohio, is denounced by several papers as a fraud. There never were so many bogus detective agencies as are now flourishing..... The Como Paper Company advertises great bargains, giving its address at 325 Dearborn Street, Chicago, Ill., but the latest Chicago City Directory mentions no such company in the city. It is doubtless one of those frauds whose "managers" have their offices in their hats, and hire letter boxes in cigar or liquor stores to enable them to pocket the remittances of their dupes.....The bogus publication Heart and Hand, is catching it hard on all sides. Subscribers complain that they have never got even a single number of the paper. Doubtless, however, it will do an enormous amount of self-puffing during the next subscription season.....The Empire Co-operative Association is denounced as a humbug.....

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

LAW WITH REGARD TO THE FLOW OF SURFACE WATER.

J. J. T., Buffalo, N. Y.—The farm adjoining mine is in some places higher than mine, and during a rainy season the water runs over and leaches out my land, doing considerable damage. Can I compel the owner of the higher land to make a ditch to conduct the water into his own creek, a job which will not cost much? He insists on letting the water take its natural course?

ANS.—When two fields are adjacent and one is lower than the other, the owner of the upper field has a legal right to have the water that falls upon his land flow off upon the land below. Hence it is held that the owner of the lower field has no right to raise an embankment to stop the flow, nor has the owner of the upper field any legal right to make any excavations or ditches by which the flow of water is diverted from its natural course and a new channel made on the lower ground. Neither can he collect into one channel waters usually flowing off into his neighbor's field by several channels and thus increase the rush upon the lower field. This is the law in Pennsylvania, Ohio, Illinois, Missouri, Iowa, California, North Carolina and Louisiana. The Courts of New York, New Jersey, Connecticut, Massachusetts, Rhode Island, Vermont, New Hampshire, Maine, Indiana, Wisconsin and Kansas, however, have repudiated this doctrine. They hold that the lower proprietor may, for the improvement of his farm, lawfully fill up low places, on his land, although by so doing he obstructs or prevents the surface water from flowing thereon from the premises above, and thereby injures the upper proprietor.

LAW AS TO CLEANING A DRAINAGE DITCH.

"An Old Subscriber," Trumbull County, Ohio.—A drainage ditch runs through my land from the farm above me and through the land of two farmers below me before it empties into a good-sized creek. The man just below me allows weeds and trash to choke up his part of the ditch so that, after heavy or even moderate rains, the water rests for some time on my land doing it considerable injury at some seasons, because it cannot flow properly through the choked ditch on my neighbor's farm. Have I any redress?

ANS.—In Ohio every person through whose lands any ditch runs, is required to keep the same open, free and clear of all obstructions on his premises, and in case of failure, he shall be liable to pay all reasonable expenses of removing the same. On complaint of any person aggrieved, the county auditor shall appoint a competent person to examine the same, who, if he find the complaint to be true, shall notify the owner of the land to remove the same within a reasonable time, not to exceed 20 days. If the owner fail to do so, the examiner shall cause the work to be done, and certify the expense thereof to the auditor, who shall place the same, with all fees and other expenses in the case, on the duplicate as an assessment on the land.

LIFE INSURANCE POLICY.

L. T. N., Elmira, N. Y.—I'm about to take out $20,000 life insurance which, in case of death, I desire to be paid to my wife, child and another, the child's part to be held in trust till he reaches his majority. To whom should the policy be made out—to my wife or to my estate so that I could dispose of it by will and make my executors guardians of the child?

ANS.—The better way would be to have the policy made payable to the executors, administrators or assigns of the insured. It would be well also to have it covered by a deed of trust, containing conditions which would apply to every possible contingency, including revocation. This would leave the policy under the control of the assured during his life and would insure its being applied according to his wishes after his death.

A WIFE'S RIGHTS OF INHERITANCE.

M. T., Lodi, N. Y.—A widower with grown children, and possessed of personal property and a valuable farm, married a second wife, but has no children by her. Should he die before she does, to what part of his estate is she legally entitled?

ANS.—In New York if he dies without having made a will, the widow will inherit one-third of the personal property and will have her dower right in the real estate, which is a life-interest in one-third of it. But the husband can make a will leaving all his personal property to his children and cutting his wife off from all but the dower in his real estate; of that he cannot deprive her. The property rights of married women, and their rights of inheritance from their dead husbands vary considerably in the different States.

New Jersey Inquirer.—A man died here lately leaving a wife but no children or no property. The father of the dead husband is living and has real estate; should he die intestate, will his dead son's widow have a legal right to any part of the estate?

ANS.—No. The childless widow inherits from her husband only, and as he is dead, he can't inherit from his father.

B. S. L., Davenport, Iowa.—If a single man makes a will and marries afterwards, does the marriage entitle the wife to her third?

ANS.—A will made before marriage is void and valueless to all parties affected by such marriage. If a person has made a will before marriage, a second will should be made after the ceremony, as the other is of no value in any State in the Union.

IRRIGATED LANDS In Rio Pecos Valley, in Southeastern New Mexico. Choice limestone soil; abundance of pure water; **a delightful climate** all the year; almost continuous sunshine; altitude 3,500 feet; **healthiest locality** in the U. S., no consumption, no malaria. **20 acres** will yield a competency. Write for particulars, naming this paper, to **Pecos Irrigation & Investment Co., 84 Monroe St., Chicago, Ill.**

CATALOGUES, ETC., RECEIVED.

NEW HAMPSHIRE EXPERIMENT STATION.—First Annual report. The law creating the experiment stations provides that they shall report yearly to the governing authorities. The New Hampshire report is the first we have seen. Others will doubtless soon follow. This report contains a general review of the work of the year, and reprints the various bulletins that were issued from time to time. The station seems determined to devote its chief energies to dairy and stock-feeding problems. Cream raising, ensilage and stock feeding are some of the subjects that receive special prominence. There are one or two things in this report that are important enough to demand a second thought. It has always been the rule with agricultural instructors to advise farmers to "reduce" bones by composting them with wood ashes, keeping the mass well moistened. The R. N.-Y. has been of the opinion that burning the bones would be the cheaper plan in the end. Some experiments at the New Hampshire Station put a new face on this matter. In all cases where ashes were used to reduce bones the soluble phosphoric acid was made insoluble; while the ashes cause the bones to crumble, the loss by reversion is too great to be offset by this improved mechanical condition. Director Whitcher says regarding this practice:

"Liebig conferred a lasting favor upon agriculture when he taught the use of sulphuric acid as a means of rendering soluble the phosphoric acid in bone; but whoever encourages the use of ashes as a means of fermenting and preparing bone manure, not only cancels the good work of Liebig, but in place of it introduces a practice which is the very reverse, namely, rendering insoluble that which was available or soluble before fermentation took place. There is also a loss of nitrogen in the process, which makes the damage still greater."

In the dairy department, Mr. Wood gives the results of some experiments with churning sweet and sour cream. He estimates that, on an average, 20 per cent. of the fat in milk is lost either in the skimmed milk or butter-milk. He says that when we churn at a temperature of 50 to 55 degrees there is no practical difference in the thoroughness with which sweet and sour cream may be churned. If we are to churn at a temperature above 60 or 62 degrees there is a profit in allowing the cream to become slightly acid. While none of Mr. Wood's experiments are conclusive, it seems to the R. N.-Y. as though he inclines towards advocating the churning of sweet cream at a lower temperature than that usually employed. He is careful, however, to urge those who churn at a low temperature to avoid overloading the churn. A churn from one-fourth to two-fifths full has given him the most satisfaction. Again, there is greater danger in having the cream too thin than there is in having it too rich and thick. "A cream yielding one pound of butter from 2½ pounds of cream is a good standard."

THE ENGLISH SPARROW.—This is the title of a large book of 408 pages with numerous tables and illustrations, and a large map that is sent out by Dr. Merriam, of the Department of Agriculture. If this ponderous volume were an argument against trusts or anarchy, or some other social wrong, there might be some dignity about it, but to hurl it at the little English sparrow seems like taking a Gatling gun to shoot a house-fly. The volume proves most conclusively that the English sparrow is a great nuisance. As nine out of every ten persons who know the bird have long been convinced of this fact, we do not see the exact need of this ponderous explanation. Agriculture has better uses for money than this. Imagine the good that would result to American agriculture if the pains-taking search and laborious investigation that are evidenced in this work could be spent upon some more practical subject.

COLIC OF HORSES.—In Bulletin No. 2, Volume II. of the Ohio Experiment Station, (Columbus, Ohio), Dr. Detmers has a lengthy article on the above subject. It is a learned article, and, so far as we can judge from a hasty reading, tells about all one can tell about this disease. But it is too long. Does Dr. Detmers realize how long it will take the average farmer to read this volume understandingly? "If inflammatory processes, especially in the peritoneum, are developing, a good and promptly acting counter-irritant, applied to the flanks, will have a tendency to reduce the inflammatory process in the interior of the abdominal cavity." There we have a semple sentence. The man who gets up the veterinary notes in the "Spavin Cure" almanac can put that into six words and his "cure" will attract 10 readers where one can be induced to read this able discussion of the causes and treatment of a dangerous and common disease. This bulletin presents an excellent example of the class of work that will do the station little good. "Words, words, words!" as Hamlet says.

Gentlemen, you must remember that you are not talking to a class in the lecture room, but to a class of business men who want the facts, presented in a simple manner. It would take too long to prepare a synopsis of this bulletin. The R. N.-Y. understands that the Department of Agriculture, at Washington, is soon to begin the publication of pamphlets on the various diseases of domestic animals. We hope the Department will not take this one as a model.

FOREST TREE PLANTER'S MANUAL.—This pamphlet of 55 pages, is published by the Minnesota State Forestry Association, and sent by C. L. Smith, Minneapolis, Minn. The object of the author was to prepare a handy manual for the use of all who were in any way interested in forest tree planting. It is an excellant book.

OUT-DOOR SILOS.—A year ago the R. N.-Y. gave Prof C. S. Plumb's experience with silage stacks. In the report of the Farm Superintendent of the Geneva Experiment Station, we find an account of further experiments with an "out-door" silo. This "silo" is simply a stack of green stalks or hay very tightly pressed by means of boards and wire ropes which are drawn into place by wheels and levers working much like an ordinary hay press. The first experiment, 1887, was not, in all respects a success. Early in September, 1888, another experiment was begun. Foundation for the stack was made by spiking together three sets of two-inch planks which were 14 feet long and 10 inches wide. These were placed edgewise on the ground about 3½ feet apart, and on them were placed planks forming a low table 10 feet square. Joists four by four inches square and 14 feet high were raised at the corners perpendicular to the bottom, and stayed for guides in building the stack. September 14, 16,681 pounds of stalks were put on the foundation. These made a heap 9½ feet high. Four loads were placed within the joists and when the filling had reached the top edges they were raised their width. The green corn stalks were drawn fresh from the field, weighed, and piled on the stack with the buts all brought out to the board guides. In laying on the stalks great care was taken to keep the top level. This was accomplished by putting in thin layers and placing the buts of the second layer over the bent-in tops of the first, with the next two layers put on in the same way at right angles to the first. These four layers would fill about the width of the boards. On the 15th, 6,518 pounds of sorghum were put on. The sorghum was three feet deep, but raised the pile to only 10¾ feet. Then 9,406 pounds of corn were put on the last thing at night (Saturday), which raised the stack nearly to the top of the joists. The corn was 9 to 12 feet tall and most of it bore pretty well developed ears. This fact probably made the stack more solid in the middle, hence a little crowning? and this combined with the slippery character of the sorghum plants, caused the top to slide off before the weighting could be done the following Monday morning. This could not be properly replaced without removing the whole stack, so a new foundation was laid exactly like the first and the corn and sorghum which slid from No. 1. were put on it in the same way as given for building No. 1. Enough more corn was put on No. 2 from the field to make the whole somewhat more than 10 feet high.

Eight or 10 inches of straw were strewn over the top and partly covered with plank laid at right-angles to the improvised timbers in the bottom. Three other timbers, each made of plank in the same way as those at the bottom, were then laid across the top and so braced that they would not tip down when applying pressure, and pressure was applied by means of chains and the levers. A roof with about 30 degrees' pitch was then attached to the timber by which the pressure was applied so its weight was added to the pressure obtained from the levers. Silo No. 1 was simply covered with about two feet of straw and a board roof was laid on without further pressure. At the time silo No. 2, was being built up from the material which had begun to heat up in No. 1, the temperature was taken in many places, showing that the highest degree reached and indicated by the thermometer at the time was 134 degrees F. Exposure to the air and consequent cooling after heating up so much were considered against the good keeping of the silage.

The stacks were opened January 16, 1889. The condition of the silage, taken vertically from the bottom, was as follows. Twenty inches of bottom fresh green; 15 inches sorghum brown, yet feedable; 20 inches corn above sorghum brown, yet maybe feedable; 13 inches corn on top, somewhat brown yet feedable. It was thought that the second handling of the corn injured the quality of the silage. There seem to be two serious objections to the out-door silo: the large proportion of loss and the inclemency of our climate when the silage is to be fed. On the whole, it looks as though the American silo had better be built in the barn.

Indust'l Societies.

THE ROYAL AGRICULTURAL SHOW AT WINDSOR PARK.

(RURAL SPECIAL REPORT.)

The finest show in the Society's history; a fine display of light and heavy horses; a cattle exhibit to be remembered; excellent shows of sheep and swine.

THE exhibition commemorating the semi-centennial of the foundation of this the greatest of English societies, is said to be the best ever held. Not many agricultural societies can boast a queen for a president; not many can welcome exhibitors and visitors to a royal park, in the shadow of a royal castle. All these favoring circumstances, conspired with the efforts of the best breeders among the nobility and gentry, and the munificent prizes offered, to make it truly a royal show in more senses than one. The park attached to Windsor Castle, one of Royalty's favorite residences, 22 miles west of London, comprises about 1,800 acres; but the space inclosed for the show was about 150, and this was literally covered, the whole exhibition, with the single exception of the Queen's pavilion, being under canvas. The buildings were all 20 feet wide, those in which cattle and horses were exhibited being divided in the middle, 10 feet being devoted to stalls, and 10 to spectators while those for sheep and swine have a double row of pens through the middle. The judging is all done on the first day, in open rings where the judges' work may be viewed by all the spectators. Then during the remainder of the show the visitors may study the prize-winners, and thus be educated in a practical way. I have been particularly interested in observing the different breeds of horses and cattle, and in comparing them with what may be seen at exhibitions in our own country.

The arrangement of the horses is admirable, the light horses being placed in a class by themselves, and the heavy breeds the same, so that one may view the individuals of any particular breed together. The light horses were placed first, and of these the Hunters make up nearly half of all the entries, there being 258 out of 571 in this class. Mr. Burdett-Coutts, whose name may be familiar to some Americans, was among the exhibitors in this and some other classes. The Cleveland Bays and Coach-horses were classed together, and although the number of entries was not large, some very fine animals were shown. These valuable breeds should receive more attention on both sides of the water. The Hackney class was well filled with fine animals, both for harness and saddle. The entries in the pony class were very light. The different classes for Shire horses were well filled, and there were many fine animals of this popular breed. Prof. G. E. Morrow, of the Illinois University, witnessed the judging in this department and expressed himself as much pleased with the champions. The show of Clydesdales was excellent, and in some classes the number of entries was very large. The class of two-year-old colts was especially fine, and the judges had much difficulty in deciding as to which of two especially fine animals should receive the first prize, First Choice finally receiving the award. There were a large number of Suffolks, comprising some very fine specimens. A very striking feature is their great uniformity as to size, color and character, as compared with some of the other breeds. Some of the older exhibitors claim that this breed is not what it was 30 years ago. The entries for asses were numerous, and the fine animals exhibited were a surprise to many of the Englishmen present.

The display of cattle was a good one in all respects, and the number of entries was large in nearly every class. There were 216 entries of Short-horns which is the favorite breed with the beef-eating Englishmen. Indeed it seems to be difficult for an Englishman to speak favorably of any animal which does not show good beef points, no matter to what breed it belongs. The Herefords are said to have made their greatest show since "Farmer George's" day. They are very attractive in the show-ring on account of their uniform markings, and regular outlines. The hardy Devons, although not so numerous as some of the other breeds, were in sufficient numbers to attract considerable attention. Some of their admirers say that they cannot be surpassed by any of the bovine race. A breed which seems to be growing in favor is the Sussex. It is a beef-breed, however. In contra-distinction to the Short-horns, there were a few Long-horns exhibited, but the breed seems to have suffered a decline, very few breeding them at present. The exhibit of polled cattle was quite large and represented the Red Polled Norfolk and Suffolk, and the black Galloway and Aberdeen-Angus breeds. The Ayrshires, Jerseys and Guernseys were present in quite large numbers for an English show, but John Bull could see little to praise in these breeds except their large udders, and these are a secondary consideration with a nation of beef-eaters. During the present long-continued period of agricultural distress, however, attention to butter, cheese and milk production has greatly increased year after year, and of late the dairy breeds have been pushing steadily to the front and may soon dispute for the most important positions with the beef breeds.

The show of sheep was good both in number and quality, the Shropshires leading all the other breeds. They were closely followed, however, by South Downs, Hampshire Downs, Oxford Downs, Cotswolds, and some others which made a smaller display.

In the goat department, a hornless he-goat with the American name of Buffalo Bill, was shown. There were very few Angoras.

In the swine department there were a large number of excellent Berkshires, Large Whites, and Tamworths, with a considerable number of specimens of the black breeds. As a "kicker" over the awards of the judges, the Englishman is fully equal to his American cousin, and he isn't slow to make known his causes of complaint.

CAR-FARE.

Have you ever watched the warfare
Of two women over carfare?
Each aflame with generous feeling,
Depth of heart and purse revealing;
Each inspired with gentle horror
Lest the other should pay for her?
But take note—the more insistent
Of the combatants persistent,
She whose hand most promptly snatches
At her pocket-book's stiff catches,
She who murmurs: "Don't be strange, dear,
It's all right, I've got the change dear!"
She—though I am sad to say it—
Always lets the other pay it!
—Madeline S. Bridges, in Puck.

Floricultural.

THE "SUNSET PLANT."

EARLY in the past winter a catalogue was sent to us by the Lewiston (Idaho) Seed Company, which gave considerable space to what the company deemed a new plant. The catalogue gave it the name of "Sunset Plant," and was at that time endeavoring to ascertain its botanical name if, indeed, it were known to botany. At the R. N.-Y.'s request a plant (or rather the roots) was sent to the Rural Grounds in January. We append a description as given by the Lewiston Seed Company:

"The floral plant which we have named 'Sunset' was first observed by us four years ago growing on the high sandy bluffs on the east side of Snake River. Specimens transplanted at that time to our grounds proved so interesting that we sent several of the plants to prominent botanists, floral writers and horticultural journals for identification. It was then we ascertained its rarity. Up to this time no one has named it, although handled by so many for the purpose. The larger out-door plants are two feet in hight and three feet in diameter, formed by shoots sent up in early spring bearing leaves closely resembling those of the Fish Geranium, and half hidden in the leaves appear long spikes of sunset-tinted flowers. Its hardiness is simply wonderful, thriving in the driest locations when every other kind of vegetation surrounding it withers, and enduring our greatest cold without the least protection."

Our own plant grew vigorously and began to bloom in early May. The flowers start from the axils of the leaves, as shown by Fig. 187 drawn from nature, and are borne on short petioles in clusters of two, three or four. The petals are heart-shaped, five in number and the flowers of a salmon color, are about an inch in diameter. The color of the buds is a pleasing shade of deep orange. The plant continued to bloom profusely until it was set out in the open border and it is now again in bud. The stems are about two feet long and need support. The leaves, as shown, are, in form, like those of the currant and of a light, glaucous color. The whole plant bears a general resemblance to Malva rotundifolia, the "Cheeses" of the children.

Now as to the name: we at first supposed it to be Malvastrum coccineum. We then found that the same plant is printed in Thorburn & Company's catalogue as Malva miniata. To settle the question, a flowering branch was sent to Prof. Vasey, Botanical Division of the United States Department of Agriculture, who identified it as Sphæralcea Munroana, formerly Malvastrum Munroanum.

The Lewiston Company writes us as follows: "We removed a plant to our grounds four years ago, which is now probably eight or 10 years old. The plant then was perhaps four feet across and three feet high. It is now seven feet in diameter by four feet high with about 100 stems or stalks, all of this season's growth. The leaf and bloom also show a proportional increase in size. We are pleased to learn that you have decided upon its identity. It has been sent to a great many for identification, but you are the first to locate it." The "Sunset" plant may not set the world on fire, still it may prove of considerable value for certain positions and uses.

THE "SUNSET PLANT." From Nature. Fig. 187

Pomological.

APPLE SCAB.

FUSICLADIUM DENDRITICUM.

B. T. GALLOWAY.

There is perhaps no disease of fruits more familiar than that which forms the subject of this paper. From the earliest times it has been talked of and written about, but despite all this it is only within the last few years that an intelligent effort has been made to study and combat it. As is now pretty generally known, scab is caused by a minute parasitic fungus which attacks the fruit, leaves and young branches. This fungus, it must be remembered, is a plant like the apple upon which it lives, and, like the latter, it exists for a certain period, produces bodies analogous to seeds and then dies. Its appearance upon the fruit (Fig. 188) is so well known that a description of the effects it produces is not necessary here. It might be well, however, to say a few words in regard to the time when the scab spots first appear, as this knowledge will enable the fruit-grower to combat it in a more intelligent manner. In the first place, scab often, and we may say, as a rule, makes its appearance early in the season, frequently in fact before the apples have attained the size of peas. At this time it of course requires very close scrutiny to detect the little black specks which mark the points of infection. They are usually present, however, and, if suitable conditions of moisture and heat exist, they soon develop into the well known scab spots. If only a few of these spots occur, the general contour of the apple is not materially affected; if, however, the spots are numerous, the fruit rarely attains full size, is very likely to become hard and knobby and when in this condition it is fit only for the hogs.

It is not generally known that the scab spots increase in size after the fruit is harvested and stored for the winter. This, however, is the case, as has been shown by careful observations; moreover, it is known that if there is much moisture present, as is frequently the case in cellars where fruit is stored, the diseased apples will infect healthy ones when brought in contact with them. With these facts in mind, let us turn for a moment to the fungus as it occurs upon the leaves, and note the effects it produces there. The leaves are rarely attacked before they have attained full size, and the presence of the disease is first made manifest by the appearance of small, more or less circular, greenish, velvety spots (Fig. 189). These rapidly enlarge, soon run together and in many cases ultimately cover the greater portion of the leaf.

The spots are visible on both sides of the leaf, but, as a rule, they are darker and more velvety upon the upper surface. As the season advances the affected leaves often become twisted, and finally, if the disease is more than ordinarily severe, they drop from the tree. It is obvious that where the foliage is affected in this way, the vitality of the tree is greatly impaired and in consequence a crop of small and inferior fruit is the result. It will be seen therefore that whether the fungus occurs upon the leaves or fruit or both, the apples are in the end certain to be injured. Having now noticed some of the more familiar effects produced by the scab, let us direct our attention for a moment to the

MICROSCOPIC CHARACTERS OF THE FUNGUS, WITH THE VIEW OF ASCERTAINING HOW IT GROWS AND REPRODUCES ITSELF.

A thin cross-section of one of the scab spots on the fruit, shows, under the microscope, that the fungus is confined almost wholly to the surface, and that for the most part it consists of a compact mass of more or less dark-colored, minute cells which are seated directly upon the healthy tissues of the fruit. This mass of cells is the body of the parasite; it is at once the root, stem and leaves of the plant, or in other words, it appropriates the nourishment necessary for its existence; not, however, from the air and soil as the apple does, but from the apple itself. In doing this it destroys the delicate tissues of which the fruit is composed and as a result a scab spot is formed. From the exposed surface of the mass of cells referred to above—which by the way may be called the stroma or bed—there arise numerous short, brown stalks, upon the free ends of which are borne the spores or reproductive bodies of the fungus. These are as a rule, egg-shaped and are attached by their larger ends. They are very minute, frequently less than one fifteen-hundreth of an inch in diameter, and are occasionally divided by a transverse partition. Each scab spot gives rise to immense numbers of these bodies; in fact the greenish, velvety appearance already referred to is due to their presence together with that of the stalks that support them. They germinate readily in water by sending out usually from the small end a slender tube which, if in contact with a healthy apple or leaf, bores into the tissues and once therein soon develops into a stroma. The development and spread of the fungus may proceed in this way throughout the growing season, its most rapid growth taking place during the spring and autumn months. This is a wise provision of nature for the fungus, but an exceedingly unwise one for the apple, as thereby the parasite is enabled to produce a big crop of spores the last thing in the fall. These live over winter on the young twigs, the old leaves and fruit; and the following

spring they begin germinating at about the time the fruit is forming, finding at this season just the conditions necessary for rapid development. This in part explains why, as stated in the beginning, infection of the fruit usually takes place in spring. Another reason for this, and one perhaps to which more importance should be attached than to the preceding, is that at this period the cuticle or skin of the apple is thin and delicate, consequently it is more easily penetrated by the germ tubes from the spores.

At Figure 190 is shown a section of the skin of an apple affected with the scab. The upper figure illustrates the germinating spores. These drawings are very highly magnified.

It will be seen from the foregoing remarks that the life history of the fungus, so far as known, is exceedingly simple, yet, notwithstanding this, the importance of knowing how the fungus lives will become more apparent when we discuss the means employed for combating it. Before taking up the latter subject, it might be well to have it understood that the development of the fungus on the leaves is practically the same as that which takes place on the fruit. The same dark-colored stroma, bearing its stalks and spores, is produced in the former as is in the latter case and it is these that give to the spots the appearance already described and shown at Fig. 189.

TREATMENT.

From what has been said it is obvious that the first steps in the way of treatment should be taken with the view of getting rid of as much of the infectious material as possible. Beginning then in autumn, the affected leaves and fruit—such of the latter as may be unfit for the hogs—should be carefully raked together and burned. Where the trees are badly affected some advocate the pruning and burning of the young twigs, and it is very probable that this will result in much benefit, as the spores which winter upon these are almost certain to infect the leaves and fruit the following spring. After taking such steps as will insure the destruction of as many of the spores as possible, some fungicide, that will prevent the rest of the spores from infecting the leaves and fruit, should be applied. For this purpose a solution made by dissolving one-half an ounce of sulphuret of potassium (liver of sulphur) to a gallon of water, will be found as cheap, practical and efficacious as any. Make the first application of this solution when the young fruit is about the size of peas, taking care to spray with sufficient force to reach all parts of the tree. If the weather is unusually cold and moist at this time, extra precautions should be taken to bring the fungicide in contact with all of the fruit. The second application should be made 10 or 15 days later, after which it should be repeated at intervals of two or three weeks until five or six sprayings in all have been made. Pumps and nozzles, suitable for applying these solutions, may be obtained at very reasonable cost from almost any of the firms who deal in insecticide apparatus.

In conclusion, it might be well to say that, before storing the fruit it should be carefully assorted and all the scabby apples thrown out. The importance, too, of keeping the fruit as free from unnecessary moisture as possible, is evident from what is known concerning the development of the fungus.

The Swineherd.

FEED AND SKULL FORMATION.

Mr. Olof Schwartz Kopff contributes a paper to the last bulletin of the Minnesota Experiment Station, in which he states some curious facts regarding the skull and teeth of the hog. Without going into the details of the experiments recorded by Mr. Schwartz, we may say the following are his conclusions:—

I. The order of succession of the teeth in our precocious pigs remains the same as in the primitive hog.

II. The times when the teeth appear are variable, according to the race, feeding and health. The same breeds, raised under the same conditions, will show the same appearance.

III. The form of the skull depends upon nutrition, health and more or less employment of certain muscles of the head and neck.

Mr. S. says that the pig has, perhaps, the most elastic and changeable organization of all of our domestic animals. It also has the advantage of being able to digest all kinds of food as an omnivorous animal; last, though not least, it multiplies more rapidly than any other domestic animal, even the sheep. Therefore it has been at all times regarded, and properly, too, as the animal *par excellense* for experiments in breeding, and the pig is the best example of what men have accomplished in the production of animals. Hitherto zoologists have been of the opinion that the form of skull of a fixed species is unchangeable from generation to generation, we may say for thousands of years. This is correct as long as we think of individuals raised in the freedom of nature and under natural and similar circumstances. But domestication, with its forced feeding and breeding for various demands, has brought about changes in many respects, and it is now evident that the form of the skull does not rest merely upon heredity. Continued weakness, caused either by disease or insufficient food, produces a long, slender skull, while the skull from a strong pig shows a remarkable expansion in its latitude and altitude.

Besides the nutrition influence, a strong or weak muscular action plays an important part in the production of form. The pulling and pressure of muscles extensively used for certain purposes, especially those of the head and neck, will give the head a characteristic shape. Pigs which are prevented from rooting will acquire a short, high and rounded head, while those which are forced to root to secure a portion of their food will develop a long and slender form of head. If we force both experiments to the greatest degree possible, we shall produce those extremes which distinguish the wild pigs from our improved races. That this is true is proven by the fact that when our domestic hogs are returned to absolute liberty, it will require but a few generations to reproduce the original skull of the wild pig. And, vice versa, we have called into existence from the primitive hog all those different representative types of our day, by careful and continued selection, gradual assortment, and particular attention to the desired qualities of form, size, etc. The striking difference between the skull of a primitive hog and a modern one is seen in our pictures, Fig. 191 showing the skull of a Texas boar, the typical wild hog, and Fig. 192 showing the skull of a Yorkshire sow—the "lazy" hog par excellence.

Farm Economy.

PLOWING BY STEAM!

IS IT PRACTICABLE?

TRACTION ENGINES vs. HORSE POWER.

All old books on agriculture contain a chapter on steam plowing in which the practice is hinted at as a possibility. Many trials of steam plows have been made in England, and while some of these implements have given fair satisfaction, they now seem to be giving place to a new implement—the steam digger. In this machine a number of heavy spades take the place of plows These spades are driven into the soil by mechanism somewhat similar to that employed in a hay tedder. Thus these large spades work in the soil with much the same movement as is given to an ordinary spade in the hands of a strong workman. The diggers are hauled over the ground by traction engines. They dig at the rate of an acre per hour. The steam digger has not yet been brought to this country, so far as the R. N.-Y. is aware. Some of the makers of traction engines have produced a "plowing outfit" to accompany the engine when desired. One that seems to have been quite successful is made by the Geiser Manufacturing Co. This is quite a simple contrivance. Six large plows are attached to a heavy frame which can be fastened behind a traction engine with suitable connections for raising or lowering the plows. In plowing, the engine moves across the field, hauling the frame behind it and plowing a space six times as wide as the ordinary furrow. The R. N.-Y. has been communicating with a number of persons who have used this "outfit." The points we most desired to make clear are covered by the following questions:

1. On what soils does the steam plow do its best work and on what soils does it fail?
2. Must the land be entirely level?
3. How does the cost compare with that of horse-work?
4. What speed can be maintained?
5. Can the steam plow work in soft or wet ground?
6. Is it at all probable that steam plowing will become general in any section of this country? Is it to be a factor in the work of large farms only?

FROM J. F. MILLER.

I have never used any steam-plowing machinery, but a neighbor has a road engine and I employed him to break up some land for me. He uses the engine to run a thrasher and to plow and to do anything that a stationary engine will do. It will travel over any ordinary country road as easily as a wagon, and haul almost anything that is hitched to it. In plowing for me he used six plows, cutting about 14 inches each in width and about 10 inches in depth. The plows are fast and cut everything and turn it under. I consider the work done much better than any that can be done by horses. It breaks any soil, and works as well in rolling as in level land, but will not work if the hill-sides are very steep. The owner charged me $2 per acre for breaking land, and I believe he broke about 15 acres per day. The speed is about equal to that of a good pair of horses, but it could be made to run faster if desired. The great trouble with this engine is the difficulty of keeping it fed with water, as it does not carry much water and requires an extra team and frequent stoppages to obtain a fresh supply. It can work wherever horses can, if the land is not too steep, but it requires careful attention, and several hands to keep it supplied with water. It is entirely too expensive ever to come into general use—costing about $3,500—except upon large farms where there are large quantities of land to be broken up, grain to be thrashed, silage, etc., to be cut and hay to be pressed. It is not adapted to the cultivating of crops after they are planted.

Gonzales, Texas.

FROM G. W. HUGHES.

I have tried the steam plow over a year and have plowed 300 acres with it. I have found no soil in which it failed to do extra-good work except where the land was too wet to be plowed. I think it will plow anywhere and in any kind of soil when the latter is dry enough to be plowed, and it will do much better work than can be done in the old way by horse power, except where the ground is too hilly or rough to run a traction engine over, and the cost of plowing by steam is less than half that of plowing by horse-power. It travels about as fast as a good brisk team, pulling six 14-inch plows or turning seven feet at once going across the field. I think in a few years steam plows will be in general use all over the country like steam thrashers, and that every man who gets a traction engine for thrashing will get one large enough to pull plows and he go around plowing just as he now goes around thrashing. I use my engine almost all the year, beginning in the spring plowing about 15 acres per day. Through the thrashing season I run a 36 inch cylinder separator. After that is over, I do fall plowing. When it freezes up I use my machine for shelling corn and grinding feed. I can, and have shelled and ground 90 bushels of corn per hour, and the cobs will more than make fuel for the engine while doing that amount of work.

Hume, Illinois.

FHOM J. N MANCHESTER.

I have been using steam power on the farm for three years and it has been very satisfactory. It is adapted for all good farming land that is free from stumps and stones. I have used my outfit among stumps, but the work is rather tedious and slow. The plow works well on ordinary hilly ground and the engine is so constructed as to keep the water on the crown sheet going down hill.

It would cost me fully one-third more to do the same amount of work with horses, and then it would not be done as well as the steam power does it. The engine can travel about three miles per hour. It cannot work in soft or wet soil; but when soil is in condition to be plowed, there is no trouble in using this outfit. I believe steam plowing will become general on all large farms, Where a man has 200 or 300 acres to plow, and has other work for the engine to do, I consider it a paying investment. I use my engine for hauling grain to market. Last spring I delivered 7,000 bushels of ear corn at Wapakoneta, Ohio, which is 17 miles from my farm, making the round trip every other day. I had 12 wagons attached to the engine and each wagon averaged from 60 to 65 bushels, making about 775 bushels each trip, and the expense of this was about one cent per bushel, besides the use of the engine and wagons. Part of the road is quite hilly. In 1887 I attached two self-binders to the engine and cut 150 acres of wheat. I also use this engine for sawing wood and lumber, and thrashing, etc.

Belle Center, O.

FROM W. L. SHERWOOD.

Our steam plow is adapted for almost all kinds of soils. It has never failed in any soil. It makes no difference whether the ground is level or not. I have plowed up and down hill where the grade was more than six feet to the rod without any trouble and with as much ease as on level ground. I can generally do as much work in one day with the steamer as I can do with a team in 15 days, and the quality of the work cannot be beaten by any team and hand plow. It doesn't cost me over $4 a day to run the outfit and generally a great deal less. The speed depends on the nature and condition of the ground. In good mellow ground I can go about twice as fast as horses; in tough prairie sod a good deal less. When the ground is in a good condition to plow with horses, one can plow with the steamer. I have no doubt that in a few years steam plows will be used as much as the self-binder is now used to cut grain. For when one gets his plowing done he has a first-class steam engine, large enough to run a thrashing machine, a saw-mill, a feed-mill or any other farm machinery. The size of the farm a man has doesn't make any difference; if he hasn't enough to do for himself, he can always find other people who want plowing and other work done although it is better if a person has a farm large enough to keep his machine employed all the time.

Brashear, Mo.

FROM H. H. BURNS.

I have had such a machine for two years and it has given great satisfaction. The character of the soil makes no difference. I have plowed the blackest gumbo which no one could have plowed with a team. The cost of steam plowing depends on the price of labor and coal. I can plow about 15 acres per day. It takes two men on the engine, one to steer and one to fire and tend to the plows, and one team and man to haul the water. About 15 to 20 bushels of coal are used per day according to its quality. We have very poor coal here. The expense will depend on the wages paid to the hands. I pay the two men on the engine $2.00 each per day, the man and team hauling water $2.50; the coal, say, 18 bushels at 11 cents per bushel $1.98, making together $8.48 for plowing 15 acres; when a man plows here by the acre with a team he gets from $2 to $2 50 per acre. Then I can plow with my steam plow where no man can plow with a team at any price. The speed is ordinarily about two miles per hour, but it depends altogether on the nature of the ground and on the two men on the engine. The ground must not be too soft, but it can be worked at almost any time when it is fit to be plowed by a team. I believe that steam plowing is the coming great improvement where the farms are large. I use my engine not only for plowing but also for thrashing, running a saw-mill, and grinding corn. The first steam plow was brought here about five years ago, by some farmers who had a big lot of waxy gumbo land with which they never could have done anything with a team, for when it was not too wet, it was so hard and dry that it took five horses to move a plow. The people took the steam plow on trial; took it into the same field with six plows, and the engine pulled them better than the five horses pulled one plow. From that time on they put in from 200 to 400 acres of wheat on that waxy land and were well satisfied.

St. Charles, Mo.

Farm Topics.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

Those Jersey Farms, whereon such large quantities of commercial fertilizer are found to pay, illustrate strongly how necessary it is for the farmer to understand the ruling conditions of his locality. These Jerseymen are near enough to the big cities to get fancy prices (compared with those obtainable in interior States) for two common crops—potatoes and grass. Wheat is, of course, used as a convenient seeding crop to protect the young grass from the sun. There can be no profit in it, and not a great deal in the corn. The money crops are, clearly, the early potatoes and the fancy hay.

The Profit in Potatoes.—But even at a distance from business centers, potatoes and grass may still be found the most profitable crops, with this difference, that the potatoes only will pay freight over a long haul, and the grass must be fed at home. Thus the Aroostook region of Maine makes a rotation of potatoes, small grain (wheat or oats), and grass, it being too far north for corn as a sure grain crop. New England farmers do not

take very kindly to barley, partly because they don't favor the use to which much of it is put, while many of those who are not so particular have not the skill to grow prime malting grain.

As to Fertilizers.—In my own neighborhood, as heavy a dressing as 1,500 pounds of the Stockbridge potato fertilizer is being

Apple Scab. Fig. 188.

tried, where 600 to 800 pounds have been thought all that would pay. The hint was taken from an accidental excess, which showed remarkable results at digging time. A good deal of risk has been run, in one field of about 20 acres, where the crop was planted April 16—23, and was coming into bloom when, for several nights, at the end of May, the temperature ranged perilously near to freezing. At this date—June 10—they are almost ready to dig for the early potato market. There will be a heavy yield, and no doubt a large profit, although there will be a haul of 230 miles to market. But the field is less than a mile of level road from the station.

Rather a Gambling Crop.—The friend who is growing the crop, (and another field of 40 acres planted later) is a close reader of the Rural; but I think he will not take offense at my styling his splendid field of early tubers by this name. It is really as much so as hops were here, until the Pacific coast supply froze our hop-growers out. The chances are a good many that potatoes planted so early will be destroyed by frost. It would require the figuring of a skilled "actuary" to settle whether in the long run such early planting would pay. But it is hardly a practical question, as the seasons are rare when it can be done.

The Price.—These potatoes, if they strike the market just right, may net the grower as much as 70 cents a bushel, or even more. They will be nearly full-grown when dug, and will escape all risks from rotting, if properly ventilated on the car. But how about the 40 acres of the later crop? Can they pay a profit over all expenses, including $30 worth of fertilizer per acre? The land is light and level, and the whole work is as much as possible done by machinery, including planting and digging.

Some Random Figuring.—I think our farmers generally do not average much over 100 bushels of merchantable potatoes per acre. The census puts the average yield under 80 bushels, but that looks much too low to me. They continue to grow the crop in this way, and think they get a little profit on it, (where access to a shipping point is not too difficult), at an average price of 35 cents a bushel at the cars. Planting, fertilizing and harvesting are done by hand; and the patches, per farm, probably do not average more than two or three acres. Experience will, I think, justify the statement that without any other manure, potatoes on turned sod, getting 600 pounds of Stockbridge, may, with clear culture, be made to give the grower 150 merchantable bushels, or, at 35 cents, $52.50 per acre. To pay the cost of adding 1,000 pounds more fertilizer, there must be an increase of nearly 60 *bushels.*

Special Advantages.—I do not believe our farmers could, as a rule, get a new dollar for an old one by this practice. But where a man has large, level fields of good potato land, handy to the station, uses the best improved machinery, and ships on his own account, the condition of things is bettered. Many wastes are then prevented, and many losses forestalled. If his fertilizer costs him but $30 per acre, and his crop nets him 45 cents, he is clearly in a better condition than the small farmer, especially when the latter has to make a long haul over a bad road, and sells at the car. If the added 1,000 pounds of fertilizer add 100 bushels per acre to the crop, there is a profit. But, then, we are saying nothing about the extra risks of rot, a glutted market, etc.

The Secondary Profit of improved succeeding crops has a right to consideration here. If the grain can be bettered and the grass doubled, even for one year, it may pay even the common farmer to be more liberal with his fertilizer on the potato field—provided he gives clean culture, which, so far, he has generally failed to do. A clean field of potatoes in early September is a rare sight on the average farm; and no man can afford to buy manure at two cents a pound to grow weeds.

A Still Better Way.—The skilled farmer who can command the cash to do business with, can certainly gain something by purchasing his fertilizers unmixed, and to a considerable extent unmanufactured. Fine ground bone or dissolved bone black, or mineral phosphates, with potash salts and nitrates bought for cash and intelligently mixed on the farm will give a large saving to the farmer who has command of the chemistry of fertilizers. As I can get plenty of good ashes I have used a mixture of equal parts of bone and Stockbridge, sowing on ashes before the first cultivation. To get on an equal quantity of plant food in this way is cheaper than to use a fully manufactured fertilizer. Over 20 years of experience have proved to me that here is an important saving. The young, progressive farmer ought to, and must, know something of the chemistry of manuring, if he wishes the best results at the least cost.

Rural Topics.

AGRICULTURE; AN ART, A BUSINESS, A SCIENCE, ETC.

T. H. HOSKINS, M. D.

III.

AS A SCIENCE.

With the birth of organic chemistry—the chemistry of life and living things—began the possibility of making agriculture a science. But dealing with living things, and their relations to things not living, the science of agriculture must deal from the start with questions which can only be solved by much careful study, and by slow degrees. Matter when endowed with life, is governed by different laws from those which control it on the plane of inanimate existence. On this new plane it forms a vast number of combinations, and in all of them conducts itself quite differently, and to very different ends, from the way it does when lifeless. Plants and animals are composed of but a small number of elements. Many of the substances existent and more or less active in the inorganic world have no part in the organization of living things. Life indeed produces its great and varied results with very simple materials. A few invisible gases, hardly cognizable by our senses—oxygen, nitrogen, hydrogen—combined with a few simple solids, some of them metals—iron, calcium, potassium, sodium;—others, metalloids—sulphur, phosphorus, carbon, chlorine—these alone,

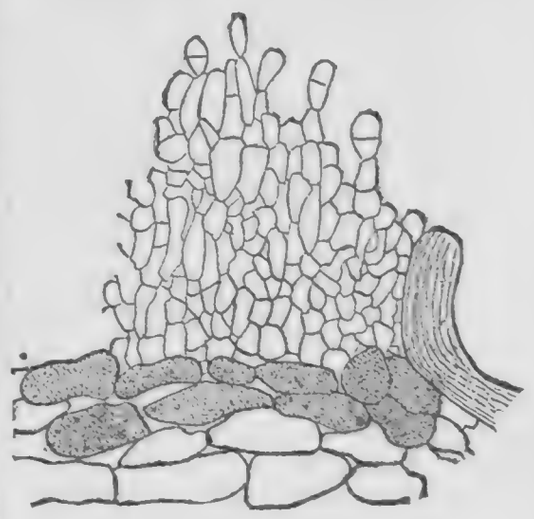
Apple Scab. Fig. 189.

or nearly alone, are the material substances with which mysterious vitality achieves its marvelous results in the world of natural things.

The scientific farmer—the man who proposes to apply scientific facts to the realization of economic results for his own and the public advantage—must seek to acquaint himself with all the laws governing in the realm of vegetable and animal life. He must do this not as a theorist, but as men like Edison or Ericsson make themselves acquainted with physical laws—having a direct purpose of applying such knowledge to practical ends. He will require a good working acquaintance with both organic and inorganic chemistry; with geology, so far as relates to the formation and composition of soils; with physiology, botany and natural philosophy. These must be the leading subjects of instruction in every well organized school of agriculture; and all of them must be treated there with a close view to their practical application, as is done with their special subjects in all schools designed to fit men for particular branches of work among their fellows, for the general good.

A store of such information in the mind of an active man with a love for farming, makes the business a delightful one, because he is not stepping blindly along, or plodding forward with the guidance only of dry, unreasoned maxims, handed down out of the experience of the past. He goes forward with light on his path that constantly increases; and he may feel that he can plan his course, in confidence that it is at least a measurably true one, leading to results that may be calculated in advance.

Scientific farming has passed the time when it can be made the subject of derision. Agriculture, like seamanship, is not an exact science, because it has to do with uncontrollable natural forces. But just as mathematics and astronomy and meteorology com-



Apple Scab. Fig. 190.

bine to aid and facilitate navigation, so the sciences named place power in the hand of the farmer with which his predecessors were unfurnished, and which his competitors at this time generally lack. It is just as absurd, therefore, to decry science in farming, and to assert that farming may be made quite as successful without it, as it would be for the navigator to neglect the compass, the barometer, and all the other scientific aids belonging to his profession, and to hold that the seamanship of the Phenician sailor is sufficient for all his needs.

This comparison may be followed farther with profit; for just as it is impossible for a youth to make himself a successful seaman, fit to control and direct the course of costly ships, without continuously combining practice with science in his training, so it is with him who would be a scientific farmer. Work and study must go together, hand in hand, from the first step of his school training to the last. He must have for his instructors not a corps of obstructionists, but a body of living, energetic practitioners of the arts of tillage, cropping, breeding, and so on, through every portion of the business of agriculture. Every principle must be demonstrated in action to the eye and mind of the student; and more than that, he must be tested and tried, to determine whether he is really learning how to do what he is being taught. Agricultural schools that will do for the farmer, what West Point and Annapolis do for the soldier and sailor, will soon be crowded with pupils, who will justify their existence most completely.

The Poultry Yard.

POULTRY EXPERIMENTS AT THE NEW YORK EXPERIMENT STATION.

Experiments have been made at this station for the purpose of determining the approximate amount of food required for a fowl,

Skull of a Primitive Texas Boar. Fig. 191. Page 506.

the average weight of eggs, and their loss of weight in keeping, the difference in the composition of eggs, and whether any difference is due to the influence of food or of breed. Only 16 fowls were used in these experiments, which is to be regretted, as a larger number would have more nearly furnished the conditions under which fowls are ordinarily kept. The birds were placed in four pens, each containing four pullets of the following breeds, numbered in the order given. Light Brahmas, Laced Wyandottes, Single-comb White Leghorns, and White-crested Black Polish. They were fed ground oats moistened with water in the morning, raw apples at noon, and whole corn at night. The trial lasted from January 23, to February 26. Without going into details, which are given in the report, the average amount of grain consumed per fowl per day, for the large breeds, was 4.38 ounces, and for the small breeds 1.95 ounce. The total amount of food consumed on the average per day was 6.65 ounces for the large against 3.52 ounces for the small breeds. The total gain during this time was, for pen No. 1, two pounds 15½ ounces; pen No. 2, three pounds 8½ ounces; pen No. 3, one pound 4½ ounces; pen No. 4, 15 ounces. None of the pullets was laying. This shows the greatest gain in favor of the Wyandottes. The amount of grain consumed by the small breeds was 45 per cent. of that consumed by the larger. In a later trial when the hens were laying, the amount consumed by the smaller was 72 per cent. of that consumed by the larger.

On March 1, the fowls were arranged for a feeding experiment in which the influence of different feeds on the composition of the eggs was to be observed. Pens No. 1 and 2 contained two Brahma and two Wyandotte pullets each. Nos. 3 and 4 contained two Leghorn and two Polish pullets each. The pens and open yards attached were uniform in size and other conditions. All were supplied with ground oyster-shells and pure water. The experiment lasted for six months. The feed of Nos. 1 and 3 contained a larger proportion of albuminoids than the feed for Nos. 2 and 4. Pens 1 and 3 were fed from a mixture of linseed meal and wheat-bran in the morning,

Skull of a Yorkshire Sow. Fig. 193. Page 506.

and wheat at night. Pens 2 and 4 were fed corn meal in the morning and wheat at night. For the first few months all the pens were also fed raw apples, and sometimes, instead, boiled potatoes at noon. They were fed all the meal that they would eat, but always much less wheat than they wanted. The amount consumed differed somewhat from week to week. The daily average, however, for each fowl was, for the larger breeds, about 1.4 ounce of the meal and 1.6 ounce of

wheat; for the smaller breeds, about .9 ounce meal and 1.2 ounce wheat. After May 1, each pen was fed freshly-cut green grass daily. The feed in Nos. 1 and 3 was always the more readily eaten and the fowls always appeared lively and healthy. In pen No. 2 one Wyandotte was sick in March, and one Brahma died in June. In pen No. 4, one Leghorn was sick in March, and one died in April. All comparisons between the pens were made on the average of one fowl. The two Wyandottes in pen No. 2 were allowed to sit for two months from May 18. The Leghorns in pens 3, and 4, all wanted to sit for some time, though very indifferently. During the last month or more, most of the fowls were moulting, and very few eggs were obtained. A small number of eggs might reasonably be expected from fowls fed continually on one food, but the great difference in yield is noticeable. The average number of eggs per fowl for the whole period was, from pen 1, 12.5; pen 2, 33.75; pen 3, 12 25; pen 4, 41.42. The Laced Wyandottes in pen 2, and the W. C. B. Polish in pen 4, besides laying more eggs, kept their weight better, although the Light Brahmas, in pen 1, and the S. C. W. Leghorns in pen 3 were in better health.

This experiment would seem to show that corn meal was more favorable to egg-production than linseed meal. Although single experiments are of little value as determining positive results, yet they are of considerable value in suggesting future experiments.

The weight of eggs diminished by keeping, owing to the evaporation of water. The per cent. of fat was higher in the brown-shell eggs, while the shell of the white eggs was heavier. Further experiments in feeding both for eggs and meat are contemplated.

Miscellaneous.

COST OF LIVING AND BUYING GROCERIES FOR THE FARM.

J. M. MUNCEY.

ARE you a farmer? If so have you ever kept a faithful and detailed account of your expenses so that you know what your food costs? Some of the principal items in the cost of living, as my "House Expense" account shows, for 1887 and 1888, are butter, meat, wood, flour, potatoes, coffee, coal, sugar, tea, eggs and milk. Let me give the figures roughly. The total expense for 1888 was $500, and the above-named items figure $347. Remember that I have taken careful inventories of the food on hand at the beginning and close of the year. The food produced by the farm is estimated at its cash value. Now I wish to urge the importance of protecting ourselves in the purchase of all groceries that will not be damaged by keeping. There is a multiplicity of organizations and "combines" in this country, and why can the retailer of groceries object if a dozen or half-dozen farmers combine and purchase important articles of diet at wholesale prices, and in $300 or $500 lots. It may rob your townsman of a profit, but you certainly would be doing nothing but what he would do under the same conditions.

I am on a 250-acre farm, keep 45 to 60 cattle, four horses, a number of hogs, raise 20 to 30 acres of corn, and put up 60 to 100 tons of hay. I employ one regular farm hand, and in haying time I hire three or four extra hands, and at other times of the year employ extra help occasionally. I presume my books will show an average of 4½ persons to consume the provisions named. That includes the housekeeper. This will give the reader some idea of whether my living was extravagant or not.

SUGAR.—We used $26.74 worth of granulated sugar in 1887, and $30.87 worth in 1888. Now, suppose at wholesale you could buy it for 5⅞ cents per pound, as I did in 1887. On 414 pounds, you would save probably $10.35, providing the retailer was selling 12 pounds for a dollar.

Do not buy anything but granulated or strictly pure, refined, dry sugar. Every scientist and domestic economist of note will tell you that white, dry sugar is the cheapest, and contains the highest per cent. of sweetness. The only reason why some farmers' wives persist in saying and thinking that "brown sugar is the sweetest," is because when placed on the tongue the sensation of sweetness is more quickly perceptible. This is due to the fact that the grains of that sort of sugar are much finer and are more quickly dissolved by the saliva in the mouth. Another reason for buying sugar by the barrel is that you will save what your careless on or employé loses when bringing the dollar or two dollars' worth home. Perhaps it rains before he gets home and the paper gets wet. Perhaps you have the sugar put in a sugar box or pail, and that is upset. Such accidents do happen in very well regulated families. And another thing: you are not bothered with a whole bundle of groceries when you go to town after lumber or repairs to machinery or some miscellaneous load.

COAL.—If you use hard-coal for, say, one base-burner, you should figure on about 50 pounds per day. In '87 it cost me 20½ cents per day for 107 days, to heat a room about 16 x 14, with a bed-room adjoining. Coal was $8.50 per ton. I used 49 pounds per 24 hours. Buy it by the car-load and place the business with a representative, intelligent honest man.

WOOD.—I used 9¾ cords in '87, that cost me $31.25, aside from hauling and sawing.

FLOUR.—Miss Parloa says buy enough flour in the fall to last a year. Of course, it must be kept in a dry, dark place. Some good housekeepers think so. From November 12, 1886 to January 1, '87, we used 8 4-10 ounces per grown person per day. In 1887, in 5,013 meals, we consumed 913 pounds of flour, or an average of 8 7-10 ounces per person per day so that I think 8½ ounces per head will be a fair estimate for every farmer to make. Buy the best flour. Every good cook says it is the cheapest and less of it is required to make a given amount of good bread. Perhaps it would be advisable to buy a few sacks of second-grade flour to be used for pastry.

TEA.—We used tea once a day and consumed 10 pounds 14 ounces in '87. This is an average of one-tenth ounce per person and meal. A family of five would need nearly 12 pounds for a year, if used once a day, and 24 pounds, if used twice a day. It pays to buy tea at wholesale.

COFFEE.—I used 82 pounds in '87, costing $14.88. It was bought green and burned at home. It was a question about the profit of this practice as the memory of some housekeepers proves that occasionally some of it is "burned up." I think it economy though if the entire attention is given to it while burning. According to my figures, you need about two-fifths of an ounce per person, per meal. Some farmers use Arbuckle's altogether. Of course, each man can decide for himself and the purchase being made accordingly.

There are many other imperishable articles that may be purchased with advantage, and on which each woman may make a safe estimate to suit her conditions—hard soap, soda, dairy salt, ginger, extracts of lemon and vanilla, starch, matches, pepper, vinegar, sirup, kerosene, rice, chimneys, baking powder in small cans, cinnamon, cloves, canned-corn, prunes, chocolate and raisins. It will not be to a farmer's profit, I think, to buy a box of raisins. If consumed in, say, six months or less, it will probably pay. About $2 can be saved on a barrel of kerosene. The cash value of the barrel is 90 cents to a dollar. The kerosene of 150 test ought to be bought for $13 or less. At least one cent a bar can be saved on soap, and 10 to 12 cents per pound on baking powder if bought in whole sale quantities. I say most emphatically that it will pay every farmer to borrow the money, if necessary, to purchase his groceries at wholesale prices. I insist honestly that more farmers must begin to figure the cost of production of farm products, and the cost of living, or soon they will be left year after year with no profits, and perhaps a loss. Protect yourselves. It is not necessary to pay 600 middlemen their profits. They may need them; so do we.

FROZEN FODDER.—Professor F. H. Storer, in answer to inquiries about the feeding value of frozen corn-fodder, says, in the RURAL NEW-YORKER, that the damage done by freezing is due, first of all, to the tearing asunder of the cell walls in the plant by the expansion of the contained liquid when converted into ice; that if the fodder is wilted there is less cause of such disruption; but if the plants are tense with liquid, and standing exposed, they are doubly liable to injury, as the transpiration from their surfaces carries away heat additionally to the radiation. The mere act of freezing does not of itself injure the nutritive value of the fodder. It is the fermentation of the sugar in the plant, owing to its being exposed to the air in the broken cells, that causes the real trouble. If it were practicable to keep the fodder at a low temperature, this could not occur; or if it could be packed in a silo at once it would be out of reach of the microscopic organisms which induce the decay.

There is something not yet explained to us by investigators in regard to the destructive effects of frost on plants, fruits, roots, etc. As a remedy is sometimes found worse than the disease, so the thawing, if rapid and in open air and light, seems the crowning cause of the harm attributed to the freezing. For, as every one knows, if the thawing is effected very slowly, as in case of a frozen nose, by keeping it covered with snow, or roots of a hardy plant by being buried in the ground without any bending or breaking, or apples thawed slowly in a cool cave, or under earth or spring water, the objects escape destructive injury. Do the disrupted parts settle back rightly adjusted into their places, during this quiet, undisturbed condition, and so become fit again to carry on their functions? It is an important question. "W."

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

DONNELSON, Montgomery County, July 10.—We have had a very wet season so far. Oats are good and ready to cut. Hay is a fine crop. Corn will not be more than half a crop. Blackberries are abundant. Grapes good. White Clover fine and honey in plenty. There are no chinch bugs to trouble us yet; it has been too wet for them. R. C. P.

Indiana.

ROCKVILLE, Parke County, July 19.—Six inches of rain have fallen in the last seven days. Wheat is a little over one-half an average crop, and is in danger of sprouting in the shock. Our farmers, as a rule, thrash from the shock and sell at once. It does not pay to raise wheat in Indiana, but what other money crop can be substituted is now the question. Corn promises a fine yield and is almost secure from drought. Oats have a very large acreage and a fine yield is expected, but last night's terrific wind and rain storm may reduce the average. Grass yielded a fine crop of hay, and pasturage is first-class. Potatoes surely promise the largest yield we ever had. All vegetables are good crops, but as we have no market here, few of them are well grown. Daniel Webster once replied to the query: "Will the practice of law pay?"—"There is room for paying work on the upper shelf." But this does not apply to raising vegetables and fruits in our town, as our grocerymen buy wilted and any class of vegetables and fruits and set the market prices, and all go at their figures. Berries have been about half a crop. Apples, pears and peaches short.

A. C. B.

Michigan.

BIG RAPIDS, Mecosta County, July 12.—The winter and spring were unusually dry. The snowfall was unusually light and there was scarcely any rain after November until May 10. Never in the history of this country were the lakes, streams and ponds so low in the spring. Only great autumn droughts have ever before reduced the amount of water on the surface of the ground so much. On May 30, we had hail and snow, and ice formed nearly one-half inch thick. Corn and potatoes that were up were generally killed to the ground, and in some instances seeds rotted in the ground. Both clover and Timothy were injured, but seasonable rains and good weather have given us a good hay crop, and all others promise well, except corn, which is fully two weeks late. Potatoes are exceptionally fine. The wheat crop is better than for many years, but is somewhat injured by the aphis, some of the grains being shrunken. Many heads are now full of dead insects, which under the microscope show wounds, as if made by a parasite, though I have not been able to see the parasite itself. Apples, plums, cherries, etc., (peaches are not much grown here) were generally killed by the May 30th freeze. So were strawberries, but other small fruits are abundant. On the whole, the present outlook for the farmer is better than at any time in the last five years. H. C. P.

DEER LAKE, Lake County, July 19.—Hay, oats, potatoes and turnips are our money crops here. They are sold in the cities and to miners and other laborers. Hay is worth $15 per ton; oats 50 cents; potatoes 75 cents; turnips 75 cents. I do not know of any farmers who get extra prices for their products. There has been no change within the last 10 years. Farming is not done very extensively in this country. People depend on iron and gold for a living. J. H. S.

HURON COUNTY, July 9.—Crops are looking very well. Fall wheat bids fair to yield 30 bushels to the acre, on an average. The hay crop is very fair. Stock looks well. The farmers are all busy hay-making, and harvest will soon be here. Owing to the cold, wet weather in May, the corn crop will be light.

D. E. S.

Minnesota.

MINNESOTA CITY, Winona County, July 11.—Potato beetles have been so scarce that it has been unnecessary to use poison. A few mature beetles are to be seen, but there are almost no slugs. Potatoes, barley, and oats never looked better. Corn had a slow time of it through May and a part of June, and some was slightly frost-bitten, but during the past three weeks of warm weather it has grown wonderfully. Some which was planted early, (May 2nd and 3d) and which was quite badly frosted is far ahead of that planted a week later, and which escaped the frost; it is beginning to tassel out. Winter wheat will be a fair crop. J. M. D.

ANSWERS TO CORRESPONDENTS

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

THE CULTURE OF BLUEBERRIES.

Several Subscribers.—1. Can blueberries be successfully transplanted? 2. Are the berries improved in size or flavor by cultivation? 3. Is such improvement in yield or quality enough to justify one in making a business of blueberry culture? 4. How would the profit in such culture compare with that found with other small fruits?

ANS.—This matter was discussed at the last meeting of the Minnesota Horticultural Society. This discussion was started by a suggestion made by Pomologist H. E. Van Deman, of the Agricultural Department at Washington, to the effect that blueberry culture might be made a profitable industry for Minnesota people. The R. N.-Y. requested several members of the Minnesota Horticultural Society to answer the above questions. Their answers follow. We shall be glad to hear from others who have had experience with blueberries.

FROM PRESIDENT WYMAN ELLIOT.

So far as the discussion on the cultivation or domestication of the blueberry at our last horticultural meeting went, the testimony was that the bushes could be transplanted with success, but whether they will bear fruit enough to pay for the expense is a question yet to be solved. I think there is a good field for investigation for our experiment stations in this work, and trust the RURAL may be able to give them points in that direction. It is one of the subjects that needs more elucidation for a large number of our people are interested in blueberry culture. I trust the excellent RURAL NEW-YORKER may be the means of spreading the knowledge so much needed.

Minneapolis, Minn.

FROM J. O. BARRETT.

I have repeatedly tried to transplant blueberries, putting them into different soils, but I have always signally failed. I also attempted to raise them from the seed, and failed again. Hence I cannot definitely answer any of the questions asked by the RURAL. I shall renew my experiments during the coming fall, varying the treatment, and hope to report favorably after a thorough test. I have no doubt of ultimate success; and then the cultivated blueberry will be a decided improvement on the wild sort, so that it will take a place among the profitable small fruits.

Brown's Valley, Minn.

FROM SECRETARY C. L. SMITH.

1. Yes; the blueberry can be transplanted, the operation requiring about the same care as the transplantation of larches or young evergreens. The bushes should be dug in October and puddled and heeled in until the following April. If well set, mulched and shaded, 80 to 90 per cent. will grow. If the bushes are dug in April and planted immediately, 75 per cent. will live. 2. I have not tested the transplanted kinds long or thoroughly enough to tell how much the fruit is improved. Indeed I know of no improvement in quality having been made. 3. The yield from regular systematic planting would be profitable on cheap lands with favorable conditions. 4. My experiments and observations would lead to the conclusion that under average conditions the returns from other small

fruits would be more certain and profitable than those from blueberries. Blueberries bring an average price here fully 33⅓ per cent. below that of raspberries and 25 per cent. below that of currants. I cannot think of any system of cultivation that would bring the yield per acre of blueberries up to that of currants, while the expense of propagation and cultivation would be much greater with the blueberry than with the currants.

From what I know at present I would recommend their cultivation only to experimenters and amateurs as a source of pleasure not likely to prove one of profit. They should be planted quite shallow in sandy land six inches apart in rows three feet apart. Cultivation should be confined to the middle of the rows, never running nearer than eight to 10 inches. The plants should be mulched along the rows. They can be renewed by layers. The old wood should be removed every two or three years. The less they are disturbed about the roots the better they seem to thrive. I have never known them to respond to manure or cultivation like currants and gooseberries. They are liable to injury from frost or drought. The wood and buds for next year's crop are formed this year, so that it takes two good seasons to insure a full crop. The blueberry is a fruit we know so little about that there is room for experiment. A third or fourth generation of seedlings may get so far away from the Indian as to respond to the hoe, cultivator and fertilizers. In my opinion that is the direction in which we should look for success.

Minneapolis, Minn.

FROM SECRETARY J. S. HARRIS.

I do not reside in the blueberry region and consequently know but little about blueberry growing; but I believe that, like many of our other native fruits, the blueberry will have to go through a process of cultivation by the growing of seedlings, or propagation by cutting, for a period, before its cultivation becomes an assured success. 1. The plants as we get them from the woods, do not bear transplantation well. 2. I cannot say that the cultivated berries are materially improved in size or quality over those growing wild where the ground has been burned over once in two or three years to clear it of rubbish and renew the vines. 3. Cultivation increases the yield and facility of picking sufficiently to pay for the trouble, and the loss of an occasional crop. 4. Too little is known of the effects of cultivation to determine the profit from blueberries as compared with that from other small fruits. There are barren places on many farms where it would pay well to introduce the blueberry, even if no cultivation were given it farther than an occasional burning off.

La Crescent, Minn.

FROM A. W. SIAS.

The blueberry is perhaps the most important representative of the genus known as the Heathworts. I was born and reared near the beautiful grounds of Dr. Hoskins on the shore of Lake Memphremagog, Vermont. The shores of this and Lake Champlain abound in whortleberries. I have seen the time when a person could pick a 10-quart pailful in 30 minutes on my father's land. We had three varieties—the tallest bush was known as the huckleberry, and bore a dark-colored fruit. Then we had what we called the high and low-bush blueberry, the high-bush bearing much the larger fruit, and the most sought for. I never knew any one to undertake their cultivation in Vermont, but I have proved by actual experience that the bushes can be successfully transplanted and cultivated in open ground. I found a patch of about an acre of the low-bush blueberry about 10 miles from this city several years ago, and planted a few bushes with the ripe fruit upon them. They lived and continued to bear fruit till my stupid hired man dug them up, supposing them to be weeds. I notice little, if any, difference in size, or flavor of fruit under cultivation. I am of the opinion that such improvements might be reached by planting the seeds of the largest and best berries for a series of years. Doubtless blueberry culture could be made remunerative in any Northern market where the wild fruit was not too abundant, and could be made as profitable as that of currants or gooseberries.

Rochester, Minn.

INSECT IN WHEAT:—NOT INJURIOUS.

E. S., Pickrell, Neb.—What are the small black beetles on the inclosed specimens of infested wheat?

ANSWERED BY DR. J. A. LINTNER, NEW YORK STATE ENTOMOLOGIST.

The insects are small (one-twelfth of an inch long) oval, shining black beetles, with small, almost hidden heads, and clubbed antennæ. The scientific name of the insect is Phalacrus politus (Linn.). From the occurrence of the beetles, in large numbers, on heads of wheat browned and shriveled, it was but natural to accept it as a wheat pest, but an examination of it shows it to be entirely innocent of the injury with which it was associated. The species belongs to the Coleopterous tribe of Necrophaga, which embraces the most useful scavengers of the insect world, unless it be the family of Muscida—the flies. Their food is mainly dead animals (as in the Sexton-beetles), decaying vegetable matter, fungi, etc. Phalacrus and two other genera, constitute the family of Phalacridæ containing 23 species of small, oval, convex, shining beetles, which, according to Drs. Le Conte and Horn, "are found on flowers and sometimes under bark." They immediately follow in systematic classification, the family of Scaphidiidæ, embracing very similar forms, which, according to the authors cited, live in fungi. Of the seven species of Phalacrus recorded, I find the food of only one given, viz., that of P. penicellatus (Say), of which it is noted: "It occurs in many parts of the United States in the seed-vessels of such plants of wheat as are destroyed by the parasitic vegetable called smut."

The food-habits of P. politus are presumedly identical with those of the above. The examples submitted to me for identification were taken from the two discolored and somewhat dwarfed wheat-heads received, while none were found upon another head inclosed, for contrast, as "uninjured". Upon stripping the kernels of the injured heads, each one was of a marked brown color, and upon cutting open or crushing with a light pressure, one could see that the whole interior consisted of a mass of pulverulent dark brown fungoid matter, commonly known as "smut". The extent to which this pernicious fungus had been fed upon by the beetles, was not evident from the limited material sent. None of the kernels showed openings eaten into them, but this would probably have been unnecessary so long as their splitting open, as seen in several of the kernels, gave ready access to their contents. To the degree to which the smut is eaten by these beetles, they will prove of benefit to the farmer in preventing, through the destruction of its spores, the spread of the disease.

FEEDING COLTS BY HAND WITH COW'S MILK: GOITRE IN A HORSE.

R. R., Bridgeport, Mo.—1. The dam of a three-month-old colt was accidentally killed; how should cow's milk be prepared to feed the foal? 2. A horse of mine has goitre. Neighbors say it is due to drinking our well water. My mules also show small goitres already. How can the trouble be prevented and the goitres removed.

ANSWERED BY DR. F. H. KILBORNE.

1. The milk of the cow is richer in fats than that of the mare, while the mare's milk is sweeter than that of the cow. For a young colt the milk of the cow may be simply sweetened; but after the colt is two or three months old substitute sweet skimmed milk, which may still be sweetened a little. In addition to the milk, the colt of three months should have grass and a ration of oil-meal, flax-seed, scalded oats or bran. One-half pint of oil-meal or flax-seed boiled with two quarts of bran or oats will make an excellent ration for the colt. This quantity will make the colt three feeds. Should the bowels become too loose, reduce the quantity of oil-meal. Or if they become constipated, one or two tablespoonfuls of raw linseed oil may be added to his ration until relieved. It would be well to change the ration somewhat from week to week so as to give the colt a change. 2. In recent cases of this kind rub the goitre daily with compound tincture of iodine until the skin is slightly blistered, then use it less frequently. Give only rain-water for drinking-water. This will probably be all the treatment necessary in this case. In more chronic or advanced stages of goitre it is often desirable to give one dram of iodide of potash nights and mornings on an empty stomach, in addition to painting the outside with iodine. In a large goitre a diluted solution of iodine is sometimes injected directly into the swelling. The continual use of rain-water only for drinking-water will prevent the goitre.

THE EARLY HARVEST AND RED ASTRACHAN APPLES.

J. S., Plainfield, Ind.—I have just had an argument with my sister about the Early Harvest Apple. She claims it to be a red, striped apple, while I claim it to be a bright yellow; which is right? Please describe the Red Astrachan Apple.

ANS.—Downing thus describes the color of the Early Harvest: Skin very smooth, with a few faint white dots, bright straw-color when fully ripe. The Red Astrachan is pretty large, rather above the middle size and very smooth and fair, roundish, a little narrowed towards the eye. The skin is almost entirely covered with deep crimson, with sometimes a little greenish yellow in the shade, and occasionally a little russet near the stalk, and covered with a pale white bloom. Stalk rather short and deeply inserted. Calyx partially closed, and set in a slight basin which is sometimes a little irregular. Flesh quite white, crisp, moderately juicy, with an agreeable, rich, acid flavor. Good to very good. Ripens from last of July to middle of August.

FISTULOUS WITHERS.

S. S. C., Bingham Center, Pa.—My four-year-old mare is in good health except that she is troubled on the withers by large tumors which broke some time since, emitting yellow matter. This dried and peeled off in white scales. The matter no longer oozes out regularly; but is penetrating down on both sides. What should be the treatment?

ANS.—This is a case of fistulous withers. The abscess or pipe on each side should be freely opened at the bottom to allow of the drainage of the pus; and this lower opening should be kept from closing by a tape tied in the wound as a seton. Carefully syringe out the wound night and morning with a stimulating wash—zinc chloride one-half dram, or carbolic acid one dram in a quart of water.

Miscellaneous.

Several Subscribers.—The nailless horseshoe recently illustrated in the RURAL, is an English invention not yet placed on the American market.

A. B., Bergen Co., N. J.—The potato planter spoken of is the Aspinwall, made by the Aspinwall Manufacturing Co., Three Rivers, Mich. Send to them for full particulars concerning it.

J. J. T., Buffalo, N. Y.—Tile-ditching machines are made by the Streator Engine Works, Streator, Ill; the Kemp & Burpee Manufacturing Co., Syracuse, N. Y., and the Elevator Ditching Machine Co., Newark, Ohio.

J. H. M., Addison, N. Y.—How much Paris-green should be mixed with 25 pounds of flour to be put on potato vines in order to kill the beetles? I injured some of the vines of my early varieties by too strong an application.

ANS.—One-eighth of pure Paris-green for the lowest; one-quarter of a pound for the highest. *Thoroughly* intermingle.

G. C. B., North Rochester, Mass.—Could I build a small silo in a corner of my house cellar for experimental purposes? Would the steam from it be detrimental to the people in the rooms above? Would it injure the timber or flooring overhead? Would the vegetables stored in the cellar, be more exposed to frost than they usually are on account of the dampness due to the silo?

ANS.—We would not advise this experiment. There is an odor about a half-empty silo that is not agreeable to many people. It would also make the cellar too damp and would certainly not help the timbers and flooring.

DISCUSSION.

FALLACIOUS TESTS IN THE DAIRY.

C. E. LITTLE, OCEAN COUNTY, N. J.—The article in the RURAL of May 27th from G. W. D. which was graced with the suggestive caption, "As Long as a Piece of String," is worthy of study, because of the clearness with which it demonstrates several facts of great value to the average dairyman. Not that the facts are new discoveries, but they are strongly developed by the table of comparative products of his six grade Jersey heifers, only two years old, and tested during the second week's milking. A little study of these test records, which are reproduced below, plainly demonstrates that no one can tell which is his best butter cow by the quart-cup test,—by measuring her milk. This is fact No. 1; also that the percentage of cream is a delusive test: fact No. 2; also that the amount of the cream is a fallacious test: fact No. 3. These facts being demonstrated, then it follows that no dairyman knows which are his best cows, if his judgment has been formed by such fallacious tests. And it is safe to say, that 19 out of 20 have no other evidence in the matter than that found in either the quantity of milk, or the quantity of the cream; while this test of G. W. D. shows that the quality of the cream is not only a very important factor, but the uncertain factor till the churn and the scales have developed it.

Here is the test for one day, to which reference is made:

No. 1.	No. 2.
6 pounds of milk.	4 pounds of milk.
9 per cent. of cream.	15 per cent. of cream.
9 ounces of cream.	8 ounces of cream.
6 ounces of butter.	6 ounces of butter.
No. 3.	**No. 4.**
6½ pounds of milk.	10¼ pounds of milk,
8 per cent. of cream.	8 per cent. of cream.
10 ounces of cream.	8 ounces of cream.
7 ounces of butter.	7 ounces of butter.
No. 5.	**No. 6.**
6¾ pounds of milk.	7 pounds of milk.
16 per cent. of cream.	6 per cent. of cream.
6 ounces of cream.	6 ounces of cream.
5 ounces of butter.	4 ounces of butter.

I have re-arranged the products in milk and cream, in the following order of merit:—

QUANTITY OF MILK.	QUANTITY OF CREAM.	PERCENTAGE OF CREAM.
No. 4 10¼ lbs.	Nos. 3 & 4 7 oz.	No. 5—16
No. 6 7 "		No. 2—15
No. 5 6¾ "	Nos. 1 & 2 6 oz.	No. 1— 9
No. 3 6½ "		No. 3 4–8
No. 1 6 "	No. 5 5 oz.	No. 6— 6
No. 2 4 "	No. 6 4 oz.	

By the aid of my pencil I find that to make one pound of butter it requires as follows:

OF MILK.	OF CREAM.
No. 2, 10 6-10 lbs.	No. 4, 18 27-100 oz.
" 3, 14 8-10 "	" 5, 19 20 100 "
" 1, 16 "	" 2, 21 32-100 "
" 5, 21 6-10 "	" 3, 22 83-100 "
" 4, 23 4-10 "	" 1, } 24 "
" 6, 28 "	" 6, }

Evidently "all cream is cream" only in the same sense that all milk is milk. My object is to determine which of the six heifers is the most valuable animal. I find number 4, yielding 10¼ pounds of milk, the best for the milk-dealer. Numbers 3 and 4 excel in the quantity of cream, while number 5 takes the lead in the richness of her milk, as indicated by the highest percentage of cream. But for the butter product neither the heifer that gives the most milk, nor the one that gives the most cream, nor the one that gives the highest percentage of cream, is the most valuable of these six young cattle.

Number 3 producing seven ounces of butter, is the best of all for the butter dairy, although she stands in the fourth rank as a milk producer, and in the same rank for percentage of cream. Number 4 shares the honor of first position as a butter-maker, with a slight discount. No. 3 produces a pound of butter from 14 8–10 pounds of milk; No. 4 from 23 4–10 pounds, thus requiring 58 per cent. more labor in milking and handling to get the same amount of butter.

It may be observed that the poorest milker of the six, though yielding but four pounds of milk, outranks the largest milker, giving 10¼ pounds, the difference of one ounce of butter daily, being more than offset by the fact that to produce 100 pounds of butter from No. 2 requires the labor of milking, setting and handling only 1,060 pounds, while one must do this work for 2,340 pounds to get 100 pounds from No. 4—a difference in labor amounting to 120 per cent. So that the heifer that seems to be inferior to all, as usually judged, is proved by this test to be better than the one that by the same fallacious tests, stands at the head of the list. Indeed, I have a suspicion that the smallest milker is really the most profitable of all these heifers. I close by suggesting that the most pressing need of American dairymen is the invention or discovery of a method of testing a dairy, which shall be simple so that men of the field may use it, and fairly inexpensive, and also accurate.

R. N.-Y.—The method devised by Mr. Parsons of the New Hampshire Experiment Station, is well worthy of trial.

THESE WHEAT EXPERIMENTS.

T. B. TERRY, SUMMIT COUNTY, OHIO.—On page 414 V. A. S., gives us the result of some experiments in growing wheat. At the close of his article he gives his conclusions as to how to grow the best winter wheat crop in Michigan:—

Sow, about September 15, one bushel to the acre; drills about 16 inches apart; top-dress from the barn-yard; mulch with wheat straw, buckwheat straw, potato-vines, marsh-hay, etc. Rake off the mulch with a sulky horse-rake, about April 1; cultivate till the wheat is 10 inches high. With fair soil such treatment will bring from 30 to 40 bushels to the acre, as was proved in the experiment above given.

If V. A. S., will put in, say, 10 acres of wheat a year for five years, and treat it in the same way he concludes to be the best for growing a crop of winter wheat in his locality—if he will do this and actually grow "30 to 40 bushels per acre," on "fair soil," then I will have much more faith in his system than now. I do not doubt his entire honesty; but it will not do to draw positive conclusions from such a little experiment for a single season. Men should be praised for carefully mak-

ng experiments in new directions; but to say that a point is "proved" by a single little experimental strip is almost too hasty. I hope our friend will keep on with his experiments and, after a few years, I hope he will not find, as many of us have, that he knows less than he thought he did years ago. As to his conclusions, the averages of many experiences would show his time of sowing about right; but perhaps a little late. Five pecks to the acre in drills seven inches apart, would suit most of our best wheat growers. Some would top-dress where there was difficulty in getting a good stand of grass; but more would prefer to apply the manure to some previous crop. Mulching with straw is all right, particularly in exposed places; but that raking off of the mulch to cultivate—why, it might pay on strawberries where one gets $400 to $500 an acre; but then I would put it back after working the ground. Mellow earth on the surface makes a good mulch; so does straw. There is little difference. If the straw was on there I should certainly leave it on a crop bringing as little per acre as wheat. In a large way, it is possible that the earth stirring would be cheaper than the straw; but it would seem to me very unwise to remove the straw mulch to mulch the ground with mellow earth which is practically about all the cultivation would do. Now I may be wrong; but I want our friend to put straw on 10 acres of wheat next fall, rake it up and draw it off in April and cultivate the field as he states, and then give us his exact labor bill and receipts from wheat. No, better, let him put in half the field this way and half in seven-inch drills and leave the straw on. I think he will never rake off five acres again.

I put straw on part of a field, last fall, that has a northwestern exposure, and left it on. In 1883 this hill-side was winter-killed so that I plowed up the field. In 1886, the last time it was in wheat before this year, there was hardly a shock of grain on perhaps an acre and a half. So poor was this spot that it reduced my average to 25 bushels per acre. Only once in all my past experience have I had a good crop on that exposed place. This year, with the straw on it, it is heavy and even all over. I had the same sort of experience last year in another field. I cannot say whether I will get "30 to 40 bushels per acre;" but there are 660 large shocks standing on 10¾ acres, besides a large load that had to be mowed because it was down so badly.

I believe V. A. S. is doing good by advising us to mulch our wheat when we can. I know a number of farmers who have tried it and are well pleased. Hundreds of straw stacks in Ohio might have been used in this way to good advantage last fall; but it will take lots of "proof," to make me try raking it off after I get it on. And then I would not want my wheat plants so crowded as they would be with a bushel of seed in 16-inch drills. And still again, how can one sow clover if he cultivates until his wheat is 10 inches high? It would be so late here as to make the chances about even that hot, dry weather would kill it, and a grain crop without clover wouldn't be any better for me than a bank without money. I have a little experiment plot this year of this kind (wide drills), and the clover, sown early, has grown so tall that, as the boys say, it will be a picnic to cut the wheat. In my seven-inch drills the heavy wheat has just kept the clover down so that the binder goes over the top.

WHEN TO SELL POULTRY.

H. F., WAYNE COUNTY, N. Y.—On page 480 the RURAL asks, "Why not sell live poultry now?" Because hens which are doing their duty should lay for several weeks yet. If they are well-fed and still refuse to contribute their quota of eggs, by all means sell them. The roosters which are to be disposed of, should go at once; in fact they should have gone before. Hens will usually lay until about August, and then all which it is not desirable to keep over winter should be disposed of. It does not pay to keep hens after they are two years old. They are more liable to disease; they get broody oftener and lay fewer eggs between times, and are not likely to begin laying so soon in spring. August is the best month in which to sell. The market is then more nearly cleaned up of old stock, and the young chickens have not begun to arrive from interior points. I have practiced shipping during that month for several years, and have received more for my poultry than my neighbors who insisted on keeping their chickens until Thanksgiving, when they had "got their growth." I not only had more money for a half-grown chicken sold in August than the same chicken would bring two or three months later, but I saved that much feed, besides the labor of caring for him, and the possible loss from disease, vermin and inquisitive peds. Still I know people who will not sell their chickens early, because they are not so heavy as they will be in the fall. I have obtained 15 cents per pound for half-grown chickens in August, which I might have sold for six, or possibly seven in November. If you are keeping chickens for fun, it may pay to keep them until fall or winter, but if you are raising them for profit, it should not take very much arithmetic to show the most profitable time to sell. But when you send your chickens to market, send attached to their bones as much corn and other fattening foods as possible. Confine them in airy, comfortable, clean coops, feed them all they will eat up clean, mostly corn, both whole and ground, and mixed with ground oats or bran; give plenty of gravel and green feed, and, above all, plenty of pure water. In from 10 to 14 days they will be in fine condition for market. I have had the best results by shipping to New York. I make light but strong coops, about 18 inches high, with tight bottoms, the remainder of lath, close enough together so that the fowls cannot get their heads through, and of such a size that they will not weigh over 150 pounds when filled. I put them on the afternoon express, with their crops full and a supply of water, and they are in New York next morning. I drop a postal to the consignee at the time of shipment notifying him of what I have sent, and when. I have for some time shipped to a commission merchant who for several years has advertised in the RURAL, and his sales have always been satisfactory. The coops are marked with my return card, and if the expressmen feel like it they will generally return them free, although they do not agree to do this.

MORE ABOUT "CRANBURY" FARMING.

N. D., NEW YORK CITY.—The articles which have appeared in the RURAL on the system of rotation pursued by the farmers at Cranbury, N. J., are interesting and suggestive, but not conclusive. There is a lack of details and some of the statements made are apparently contradictory. Thus, for instance, on a farm of 100 acres with the five-course rotation adopted there can only be 40 acres in grass each year, and as the farmers, according to the second article in the RURAL, have not yet brought up the fertility of the soil to the point of producing two tons of hay per acre, it is clear that the total amount of hay grown on this 100-acre farm cannot exceed 80 tons; yet the farmer owning it states that he sold last year 90 tons over and above what was used for working teams—presumably two teams, though this is not stated—and cattle. Evidently there is something loose here. To enable outsiders to form a correct judgment on the premises, we need more detailed and exact information. What, for instance, is the yield of corn per acre? How many bushels of potatoes per acre are produced? What amount of farm-yard manure is used yearly? How many teams and men are employed? In short, let us have a look at the receipts and expenses of one of these farms for the whole year. It is obvious that the system is not perfected, otherwise there would be no complaints of the difficulty of getting rid of corn stalks. With the large amount of corn and corn fodder raised, one would think it ought not to be an unprofitable job to feed a few steers yearly at prices that would defy competition. But, as I have said, the articles are interesting and suggestive, and most RURAL readers, I am sure, are obliged to the paper for their publication.

R. N.-Y.—One object in printing these articles was to call out discussion and comparative statements. These will follow and then doubtless every desired detail will be presented. As to the heavy yield of grass on the 100-acre farm mentioned, it may be stated that the five-course rotation has not yet been fully developed. For example, the R. N.-Y. saw one large hay field of over 20 acres that had been cut three years and was ready for another cutting. Over one-half the farm is in grass this year because the rotation had not yet been completed. Thus it will be seen that the yield of hay could have reached 90 tons. Some of the land will yield over two tons per acre. The desire is to have the entire farm *average* that. The R. N.-Y. will endeavor to secure an itemized account of the yearly expenses and receipts from this farm. In the meantime we shall be very glad to hear from other farmers.

"IS CREAM, CREAM?"

DIRECTOR G. H. WHITCHER, HANOVER, N. H.—I see that the old question of the butter-making value of cream is again under consideration. It is a very important matter. There are hundreds of creameries where patrons are compensated for their cream by volume—either by the inch, the space or the gauge—and in all of these cases it is not only assumed, but insisted upon that a given volume of one lot of cream will give as much butter as the same volume of any and all other creams. Up here in New Hampshire it has been regarded as heresy even to suggest the possibility of there being a variation in the butter-producing value of cream raised under like conditions of temperature, etc.; nevertheless, like the belief in witches, etc., the "cream is cream" fraud has to go, and creamery patrons must be paid in proportion to the fat that is contained in their cream, not in accordance with the bulk of it, which may be varied by peculiarities of the milk.

In our work here at the New Hampshire Experiment Station, samples of cream raised under identical conditions vary from 19 per cent. to 28⅓ per cent. of fat. If we call a pound of butter fat worth 20 cents, this means that two farmers bringing such cream should receive $3.80 and $4.70 per hundred pounds respectively, instead of $4.25 each which they would receive under the polite system of robbery so prevalent in cream-gathering factories. By this system one man is overpaid by 45 cents per cwt; the other underpaid by 45 cents—a total discrepancy of 23 7-10 per cent. of the actual value.

I have results much wider than these, but I only select those where the conditions are strictly alike. But the worst feature is that in practice the conditions are not all alike. The milk of one herd may be set at a much lower temperature than that of another, and a cream may be thrown up which contains much skim-milk with the fat, while the milk of another, set in a higher temperature, is dense and rich. Under these circumstances, it is not uncommon to find one cream 30 per cent. richer in fat than another, yet all is paid for alike. Farmers must put a stop to this, for there are methods of testing cream within the reach of every creamery, and not to use them is to encourage injustice and injure both the farmer and, in the long run, the whole creamery business.

GRANULATION OF BUTTER.

J. M. C., HOPKINTON, N. H.—Considerable discussion has arisen of late, growing in part out of statements made by the Director of the New Hampshire Experiment Station, regarding certain churns as being better adapted from their construction for perfection of granulation than others. "P. C." of Milford, N. H., in the RURAL of July 6, says he "cannot see how granulated butter can be made with a Blanchard churn." He ought to know that granulation is perfected by stopping the churning process at just the right time, due regard being had to the temperature of the cream, etc. Now, churning beyond that point will cause those particles of butter to adhere together in any churn. I have used the famous Porter Blanchard's Sons churn for years beside other churns, and find no difficulty in perfecting granulation by means of it. I infer from "P. C.'s" statement, that he never used a Blanchard churn—he only saw his neighbor using one. Now, if he understands the process of granulating butter and will himself try a Blanchard churn, his testimony will have more weight. As to the process of cleaning, plenty of hot water, and a few revolutions of the crank will settle that matter in a very few moments.

If "P. C." rests his objection to the Blanchard on the ground that floats interfere with the granulation, I should say that the violent motion of the Stoddard churn, end over end, would have a tendency to cause the particles to adhere, and require more watchfulness than the gentle motion of the floats in the Blanchard.

SOME CHOICE STRAWBERRIES.

"W.", TYRONE, PA.—The Charles Downing Strawberry, which the RURAL finds still the very best on sandy New Jersey soils, is, all things considered, our very best here, on heavy clay, in central Pennsylvania. It does not bear more than Cumberland or Indiana, or Captain Jack, or Crescent, but it does quite as well, and is equally reliable, as uniformly large as the Cumberland or Indiana, most attractive in color, and the best in flavor when eaten from the plant. The Cumberland is a noble fruit, so large, so vigorous and so easily grown that we think it first choice for home planting. Indiana rivals it in extreme vigor and in fruitfulness and length of season; and is a finer berry of peculiar color approaching salmon, the same all over and all through. I received it a number of years ago from its originator, E. Y. Teas of Dunreith, Indiana. It has stout cable-like runners, and sends them out in more vigorous profusion than any other sort. Its foliage continues healthy, and is as large as that of Cumberland, but of a distinctly different tint of green when seen in mass. I have these and Charles Downing growing luxuriantly on heavy clay not stirred for years excepting on surface, and by the taking out of exhausted plants and the thinning of others. The surface is kept quite clean, and is always open, being annually mulched with sawdust or tan in December to which some ashes are added in the spring. This is an easy system of culture, practicable for women or old-men gardeners and annually successful in the most satisfying degree.

What Others Say.

THE CAUSE OF THE POTATO ROT.—A bulletin of the E. S. of the Tennessee University, as stated on p. 455, treats of potato rot. There are several kinds of potato rot, both wet and dry, which are due to various causes, but *the* potato rot—the disease which the planter always has in his mind when he says his potatoes are being destroyed by the rot—results from the growth of a parasitic fungus upon the potato plant similar in habit and botanically related to the downy mildew of the grape-vine. Owing to the fact that the growth of this parasite is favored by, and even dependent upon certain climatic conditions, many have come to regard the disease as climatic, and some who have failed to understand the true source of the malady, have believed it to be *caused* by the climate or by special conditions of the atmosphere. Potato rot has often been attributed to the character of the soil. Every one knows that the disease is most severe on lands that are heavy and poorly drained, but this severity is due to the abundance of moisture present favoring the development of fungus; the fungus is the direct cause of the rot, the soil acts indirectly, by inducing the growth of the parasite through the excess of moisture it contains.

Some have supposed that the rot was due to an enfeebled condition of the potato plant, resulting from many years of cultivation, but there is nothing to prove that this is the case. The disease has never been more destructive than during the years 1843 to 1845, and the wild potato is no more free from the malady than the cultivated varieties.

It is not the climate, or the soil, or any vital exhaustion of the potato itself that causes the rot; it comes from the attacks of a minute parasitic plant which infests the potato, penetrating in its growth both the tops and the tubers. This parasite has been artificially cultivated upon the potato and rot produced thereby; potatoes have been guarded from its attacks and thus preserved free from the disease, while potatoes, similarly situated in all other respects save this protection, have become diseased.

Season of Attack.—In the North where we raise only one crop of potatoes during the season, the rot fungus rarely becomes injuriously active before the first of August, and sometimes, according to the weather, not until a month or so later. Thus it often happens that the very early varieties escape the disease entirely, when the later sorts may be seriously injured. The former, in such cases, are harvested and out of the way before the fungus becomes wide-spread and virulent in its attacks. It appears also, though this may be questioned, that the potato plants are not particularly susceptible to infection until they have reached a certain age or stage of growth. We may see in the same field a plat of early potatoes suffering severely from the disease, while alongside there is a plat of a late sort which is entirely unaffected. Whether this exemption comes from the circumstance that the plants have not yet matured sufficiently to be susceptible to the attacks of the fungus, or from some other cause or causes, is not known.

In observing the herbaceous plants about us in the fields and woods, we cannot help noting that each has its special season of growth. Some appear early in the spring, blossom and then pass out of sight, others are conspicuous only in midsummer, while others still do not put in an apperance until late in the season. Remembering that the fungus of the rot is a plant, it cannot be considered at all remarkable that it should have a special period for development. Observation shows that it only attains its maximum development during the later summer and fall months.

Potatoes covered with from one to three inches of earth are pretty certain to become diseased if the fungus is on the tops, while those planted to a depth of four inches or more are rarely infected. It is for this reason that some practice the system of high molding or drawing up around the tops sufficient earth to cover the tubers to the depth of four or five inches. While this practice may be of value in protecting the potatoes from the rot, it is on other accounts, not looked upon with much favor by potato growers.

If the tubers become infected with the fungus they will very soon begin to rot, and un-

less dug within a short time many of them will be found entirely decayed when harvested. Sometimes the loss in the field may amount to a third or even one-half of the crop. This condition of affairs is bad enough, but the work of destruction does not cease here, for the disease continues—that is, the fungus continues to grow in the tubers, after they are harvested and stored in the pits or cellars. This growth is accelerated by warm and moist surroundings and placed in such circumstances, the disease progresses rapidly.

The Life History of the potato-rot fungus, briefly stated, is as follows, starting with the spores: The spores, lighting upon the leaves of the potato germinate in drops of dew or rain, and the product of germination—the zoospores—penetrate to the interior tissues of the plant, and after growing for a time through these tissues, the mycelium sends out, chiefly from the under surface of the leaves, slender, fruiting branches whereon are produced a new crop of spores. These may carry the disease to the other plants in the field, or to other parts of the same plant; that is, they may serve to spread the disease in the tops, which we term blight, over the entire field, or by being washed into the ground they may reach the tubers and cause the rot. At a temperature of 80 degrees and upwards, the vitality of the spores is quickly destroyed. In fact, it has been found possible to destroy the vitality of the mycelium in the infected tubers by keeping them for a few hours at a temperature of from 105 degrees to 110 degrees, a degree of heat which does not injure their value for seed. In this way, potatoes designed for seed, but suspected of containing the mycelium of the rot-fungus, may be thoroughly disinfected, and the most important source of danger to the growing crop will be thus eliminated.

It often happens that the greatest loss from rot occurs after the potatoes are dug, and one cannot be over-careful in the matter of storage if he would preserve his crop from loss. They should be kept at a comparatively low and even temperature, and especially where no dampness will collect about them. Dusting the potatoes with dry, air-slaked lime, at the rate of one bushel of the latter to 25 of the former, will help to keep them surface-dry and materially aid in their preservation.

Briefly. Select for planting a light, sandy loam or a soil which is well drained; plant only perfectly sound or disinfected seed; spray the tops with the Bordeaux Mixture or some preparation containing sulphate of copper; store in a cool, *dry* place, and keep dry.

SHORT STORIES.

FOR market purposes, among plums Mr. Charles A. Green mentions the Bradshaw, which is a large early purple variety, of fair quality, that always sells well. The tree is a thrifty upright grower, and comparatively free from the black-knot.

Smith's Orleans is of good size and showy, covered with a deep purple bloom and sells well, though only of fair quality.

IF a yellow plum were to be added it would be Prince's Imperial Gage.....

FOR home use Mr. Green, as he states in his Fruit Grower (Rochester N. Y.) would make a different selection—Green Gage, Washington, Jefferson, Yellow Gage, Reine Claude de Bavay, Lawrence's Favorite and McLaughlin.

BURPEE'S Bread-stone Turnip is said to cook thoroughly in 15 minutes. Flesh white and fine-grained, tender and sweet. One of the very best for winter and spring use. Its chief merit is that when other kinds grow strong and pithy this is at its best.....

THE White Egg Turnip is firm and tender and the quality is first-rate. The Golden Ball is a good keeper and is scarcely excelled for table use.....

KEEP the soil about late cabbages mellow..

RUTABAGA turnips may still be sown.....

THE Yellow Malta is early and of good quality. The Green Globe is very large (white flesh). The Pomeranian White Globe is good for stock. The White French is a fine keeper. The White Norfolk is late and solid. The Red-top Globe is a standard sort for the New York market. Extra Early Milan is the earliest. Red-top Strap-leaf is a popular variety for fall. ....

RED CLAWSON and Golden Cross are new wheats, originated by A. N. Jones, and they are now offered for sale. The R. N.-Y. will have a report to make on the latter before sowing time.....

THE BEST PLAN the Poultry Keeper has ever tried, and it has tried many to break hens of sitting, is to remove the sitter from the pen to which she is accustomed to one which is provided with no nest boxes. There give her generous food, abundance of fresh water, and everything her heart longs for but a nest. Don't let her be lonely. Give her for a companion a strong, vigorous, attentive cockerel. Under such associations and with such companionship the most obdurate, persistent sitter will forget her broodiness in a few days, and be ready to be transferred to her old home. This plan is not so effective as that of the R. N.-Y. though possibly more considerate. The R. N.-Y.'s way is to place the hen in a yard with a harmless dog.....

OUR contributor P. H. Jacobs, says that the "Red-Caps are persistent layers, non-sitters, and, so far, are favorites with those who have tried them. It is a curious fact that in every case those who have opposed the Red-Caps are parties who never bred them. The English consider them the best of all layers."....

AS READERS of the R. N.-Y. are aware, we have bred Red-Caps for two years and the strain is a very fine one too. They are beautiful birds, rather small, it is true. But they lay well and the egg is of fair size. Our main objection to them is their painfully large combs.....

LOVETT'S WHITE is the name of a new peach which is said to have yielded annually in certain Eastern States where most other varieties have failed. It is claimed that it is the hardiest white peach yet produced. Its season is very late. The color is a pure white; size very large; it is a long keeper; the quality is sweet and excellent. The flesh parts from the pit perfectly.....

THE GOOD is said to be a handsome, valuable new peach as large as Crawford's Late. It is said to come true from seed.....

PARKER EARLE of Cobden, Ill., remarks Mr. C. A. Green, in building a fence around his young orchards, several years ago, tried many plans for preserving the posts. Having occasion to remove the fence last winter he noted the condition of the posts as follows: Those set with no preparation were decayed an inch or more in thickness; those coated with a thick wash of lime were better preserved, but were quite seriously attacked by worms; those posts coated with hot tar were as perfectly sound as when put in the ground; those painted with petroleum and kerosene were equally as sound and as good for setting. Let the posts get thoroughly dry and then, with a pan of cheap kerosene and a whitewash brush, give the lower third of the post, the part to go into the ground, two or three applications of the oil, letting it soak in each time. Posts so treated, he says, will not be troubled by worms or insects of any kind, but will resist decay to a remarkable degree. This he finds to be the simplest, easiest, cheapest and best method of preservation.....

GOV. HOARD says in his Dairyman (Wisconsin) that common field corn, if rightly handled, will make more milk, ton for ton, than ordinary Timothy hay. Yet farmers destroy nearly all its feeding value in three ways: 1. They allow it to become too ripe before cutting and stooking. They think it will help the ears, but the ear will develop from quite a green stalk. 2. They allow it to remain exposed to the weather until the life and goodness of it are beaten out of it. 3. A great many never cut it up but turn the cattle in the field and starve them into eating the dry frost-bitten leaves and husks. For all this they pay a fearful price for waste. Many will say they cannot afford to hire help to cut up and save the corn fodder. Why cannot they as well afford to save a dollar's worth of corn fodder as a dollar's worth of hay? Every farmer expects to feed to his cows a certain amount of corn. Why not save the cost of husking and cut it into silo at once, when the stalk and ear combined are in the highest degree of excellence for feeding?.....

IT takes toil, and hard toil, to be sure, but is it a sign of smartness when a farmer has raised a fine field of fodder corn to let two-thirds of its feeding value go to waste? Is it good farming, or practical farming, to lose half of the results of your toil? Most men call it foolishness, and most men are right when they so call it.....

HERE is the recipe for the Bordeaux Mixture as Prof. F. L Scribner gives it:

"Dissolve eight pounds of sulphate of copper pure (in crystals) in 20 gallons of water; in another vessel slake 10 pounds of fresh lime in five gallons of water; when the lime mixture has cooled to the temperature of the air, pour it slowly into the copper solution, taking care to mix the fluids carefully by constant stirring. This should be prepared some days before required for use."

It will be seen that the R. N.-Y.'s formula as given in these columns a few weeks ago, does not differ from Prof. Scribner's materially, while it has the advantage of being brief and very easy to remember: One-half pound of lime to one gallon of water. One-half pound of copper-sulphate to one gallon of water....

MAJOR ALVORD says that if a tariff could be placed upon bananas and other tropical fruits without an immense amount of log-rolling he might favor it; but in the present condition of things, he thinks that the politicians and manufacturers would make a handle of such a tariff, and in the end it would only redound to the fruit-grower's injury. He says that the members of Congress are great friends of the farmers when they have an axe to grind, and that if a tariff were placed on foreign fruit, a tariff would be demanded on a dozen manufactured articles used by the farmer, so that in the end the farmer would come out, as usual, at the little end of the horn.....

IN an address made by Major H. E. Alvord, at the convention of the Maryland and Delaware State Teachers' Association, on the subject of "Agricultural Education for Old and Young," he said that we must have men who are thoroughly educated in theory and science, to enter into the fields of practical agriculture.....

THE physical and moral education which a boy gets on the farm is of such a character as to make him successful in any sphere of life..

THE farmer and his family are the seed corn of the nation. The best is selected every year for planting in the cities and towns.....

MANY seem to think that by instinct alone a man may perform the duties required on the farm, while the fact is it requires the brightest talents to become a thrifty and progressive farmer.....

THE order of things must be reversed. Instead of the brightest and best of the farmers' sons being sent to the commercial school or prepared for the "learned professions," and the dullest boy kept on the farm, the brightest boy should be kept on the farm and if necessary the dullest boy should be sent away to the town.....

AT the Maryland Agricultural College a valuable experiment is being conducted by Prof. Alvord. He has had an acre of land planted with whole potatoes no one of which weighed less than 11 ounces. It required 60 bushels of seed for the acre. From present appearances the experiment will be a success and go to demonstrate that the best way to plant potatoes is to plant large ones whole....

DIRECT.

——JOHN J. THOMAS: "Awkward, flowerless, treeless homes are abominations. The nurserymen who help to cultivate rural tastes are patriots and public benefactors."

——W. C. BARRY: "A languishing nursery business would be a national calamity."

——PROF. C. S. PLUMB: "I haven't been in the habit of indulging in much flattery, but I want to say now to you that you have certainly taken a big lead in agricultural journalism. Never has the RURAL looked so prosperous in my eyes from every point of view."

——AMERICAN AGRICULTURIST: "When a man doesn't know how to run an engine, he is not called an engineer; when he can't repeat the multiplication table, he is not called a mathematician; but any man who tries to farm, though he doesn't know how it should be done, doesn't know even the multiplication table of it, is called a farmer. He is misnamed, and that's why so many called farmers are also called failures."

——BALTIMORE AMERICAN: "Though there is a great deal of pluck about grapes, they can't help giving a wine when they are bruised."

——N. E. FARMER: "No weedy crop is ever a full crop."

——GREEN'S FRUIT-GROWER: "There are farmers who present an attractive appearance as seen at their farm work. There are others who dress so shabbily and whose beards and hair are so unkempt as to mislead the traveler who might be looking for the proprietor of the farm into suspecting that he has met a much less important personage."

——T. H. HOSKINS, in the Vermont Watchman: "We personally know farmers in every New England State and in New York who are making money right along in farming, and they have no advantage whatever over their groaning neighbors, except that they have taken pains to learn their trade well and to keep up with the times."

——"FARMING is a different thing from what it used to be, but no more different than shoemaking, railroading, merchandising, newspaper publishing, and nearly everything else. How long would even a country newspaper live if run on the lines of the country newspapers of 40 years ago? It is just so with farming. The time has come when old ways are being dropped and new and better ways adopted in every line of business."

——"This abandonment of the farms for the cities is merely temporary. Every kind of city occupation is to-day more overdone and overcrowded than farming. The big and growing cities of the West are more and more consuming the products of Western farms, which are themselves decreasing in productiveness."

——"We know a man who two years ago bought one of these 'run-out' farms, and last year cleared over $800 in cash on the potatoes he grew on a part of it."

——PUCK: "When Uncle Eben's boys complain of feeling tired in the field, he says: 'Tut, tut, you jis pitch in harder an' work it off.'"

——ELDER BERRY: "How much are these blackcaps a quart, Deacon?"

DEACON SANDERS (*the* grocer): "Twelve cents."

ELDER BERRY: "All right, Deacon; here, I've brought a quart measure along to get 'em in."

DEACON SANDERS: "Wall, Elder, I'll have to charge 36 cents for that full."

——"BIRD-SEED—Eggs."

——"WHEN marketing for chickens, always remember that the good die young."

——LARGE EARS are said to be a sign of generosity. This probably accounts for the mule's great profligacy with his heels."

——DR. KIRTLAND: "Rather than kill birds to save fruit, I would raise more fruit to attract the birds."

Horsford's Acid Phosphate

Relieves the Feeling of Lassitude so common in mid-summer and imparts vitality.—*Adv.*

Miscellaneous Advertising.

Hood's Sarsaparilla 100 Doses One Dollar

Is Your Blood Pure? If not, if you have boils, pimples, "humors," or indications of scrofula or salt rheum, you should take Hood's Sarsaparilla, which is the best blood purifier known. It effects wonderful cures where other preparations utterly fail. Be sure to get Hood's.

JOHNSON'S ANODYNE LINIMENT ESTABLISHED 1810.

For Internal and External Use.

Stops Pain, Cramps, Inflammation in body or limb, like magic. Cures Croup, Asthma, Colds, Catarrh, Cholera Morbus, Diarrhœa, Rheumatism, Neuralgia, Lame-back, Stiff Joints and Strains. Full particulars free. Price 35 cts. post-paid. I. S. JOHNSON & CO., Boston, Mass.

EMPIRE POWER and SEPARATOR BEST, CHEAPEST and MOST IMPROVED in the market.

We also manufacture Field Rollers, Plows, Feed Cutter and Crusher Hand & Power Corn Shellers, etc. Send for Illustrated Catalogue & Price List. S. S. HESSINGER & SON, Tatamy, Northampton Co. Pa.

"What! Corns and Bunions all gone?"
"Yes. I am happy to say, through the merits of **Hanson's Magic Corn Salve,** I can now walk with ease."

HANSON'S MAGIC CORN SALVE.

If your druggist does not keep it, do not let him convince you that some imitation is just as good. Send by mail to **W. T. HANSON & CO., Schenectady, N. Y.** Every box is warranted to cure or money refunded.

PRICE 15 and 25 CENTS.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Home.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, AUGUST 3, 1889.

THE BLUEBERRY.—Can it be made profitable under cultivation? See page 508.

THE Flea-beetle is again doing sad work at the Rural Grounds, and in the country thereabouts. Many fields of potatoes will not yield over half a crop, while lots of melon vines have been destroyed.

SIR J. B. LAWES writes the R. N.-Y. that Dr. Gilbert has so tried his eyes that he is obliged to take a rest. He is going to Norway. The promise of a fine wheat crop in England is very good, but dependent upon a dry July. The conveyance of Dr. Lawes's experiment grounds and laboratory to trustees and an appointment of a committee of arrangement are now accomplished facts.

SECRETARY MOHLER, of the Kansas Board of Agriculture, reports that chinch bugs seem to have been annihilated. Some contagious disease appears to be carrying them off by the million. This is doubtless the disease described by Mr. Gillette on page 85 of the present volume of the RURAL. A report from Albany states that a parasite has been discovered which destroys the clover midge in large numbers. We are all ready for more of such insects.

"*A clean field of potatoes in early September is a sight on the average farm; and no man can afford to buy manure at two cents a pound to grow weeds.*"—BUCEPHALUS BROWN. page 507.

THE development of the dressed beef business is even driving the pigs off the farm in districts near the large cities. It is very easy now to buy beef—too easy indeed for the old-fashioned farmer if there is such a person left within reasonable distance of a railroad. The pig is still a very necessary farm animal. We have not yet reached a point where we can farm without wastes of some sort. The pig will turn more of these wastes into profit than any other animal can do.

ON July 20, a single hill of early potatoes was dug in the soil which connects with the "Contest" Plot. The vines were still quite vigorous though showing some signs of approaching maturity. The hill yielded 21 potatoes, 15 of which were of marketable size, the others very small, The weight was four pounds 12 ounces which, as the seed was planted one foot by three feet apart, would be at the rate of 1,147.83 bushels to the acre. This is a mighty yield for a very early potato. It was sent to us by A. D. Wayne, of Roscommon, Michigan, who stated that the new variety was from the seed of Early Peachblow. It resembles the Early Rose, however, in every way. The quality is first-rate.

EVERY variety of raspberry growing in the Rural Experiment Grounds—whether red, black-cap or hybrid—is so affected by a disease seeemingly of fungoid origin, that raspberry culture is impracticable. During the past four years, many new kinds have been sent there for trial. Manifestly it would be unfair to the originators or introducers to make unfavorable reports regarding them.

The canes of the current season grow thriftily. These canes the next or fruiting season are attacked by the fungus when, or even before, the fruit begins to set. The leaves turn yellow and fall; the canes dry up and die, so that very little fruit has a chance to ripen.

It might have been well to spray the young canes early in the season with the Bordeaux Mixture. It did not occur to the R. N.-Y.

REPORTS come from various sources of a scarcity of potato beetles. We have not missed them in New Jersey. They are "always with us." Here is a letter from Greeley, Colorado—a communication from beetle headquarters as one might say:

"Last winter was very mild indeed. As a consequence some of the pests that afflict the farmer received no great discouragement. This spring the beetles were sitting about waiting for the potato plants to come up. They vigorously attacked potato fields, both the late and early plantings. Potatoes are the great product of this portion of the "Great American Desert." Train loads go from this point. Never before have the bugs been so bad on late potatoes. It is said that five tons of Paris-green have been used in the vicinity of Greeley alone.

ON page 510 a correspondent asks some questions about the expenses of conducting the 100-acre farm at Cranbury, N. J., from which produce to the value of $3,116. 83, was sold last year. The R. N.-Y. has a letter from the owner of this farm, that may add to the facts already brought out. He states that the farm is worked by his sons for an interest. It is therefore impossible to state the value of the labor employed in a year. The young men employ one man at $13 per month and board for nine months. During, haying and harvesting and while picking potatoes more help is hired. The corn crops, one year with another, will average 50 to 60 bushels per acre. Wheat last year did not yield over 20 bushels per acre. Potatoes averaged about 230 bushels of marketable tubers, while the hay crop exceeded 2½ tons per acre. One year with another, from 150 to 160 loads of yard manure fairly decomposed are used.

THE general public should soon be prepared for an advance in the price of sugar. The Sugar Trust is evidently getting ready for such a contingency, which will be falsely attributed to failure of sugar crops in this and other countries. In reality, however, it is packing large warehouses in Brooklyn with raw and refined sugar in order to lessen the available supply and consequently increase the price. After having shut down some of the associated refineries entirely and curtailed the production of refined sugar in others, it is now tightening the screws on the dear public by withdrawing a large share of the product from market. Considerably over 300,000 barrels have already been stored away, and trucks and lighters are kept constantly busy adding to the amount. With the price of salt raised by one trust and that of sugar by another, every household in the country will soon feel the effects of these "purely business affairs."

The Pennsylvania State Agricultural Society is in trouble about its fair grounds at Philadelphia. It owes about $70,000 and has no means of paying even a part of that sum. The Reading Railroad Company holds a mortgage for $25,000 on the fair grounds and is about to foreclose, "in order to protect itself" against other creditors who have secured judgments against the organization. It will be to its interest, however, that the fairs should continue to be held regularly, as they bring no inconsiderable traffic to the line. On foreclosure, the leasehold of the grounds and the buildings will be sold at auction, and the railroad company intends to buy them in for the use of the State Fair Association. The members of the latter, however, appear to have been poor business men, at least in their fiduciary capacity. Until quite recently, they allowed the grounds to be used only at fair times, whereas a very good revenue, it is claimed, could have been secured by leasing them at other times for picnics and other entertainments. As in the case of many an unfortunate farmer, the association's ideas were too big for its pockets. It went heavily into debt to make a big splurge, was neglectful of small economies, and now finds itself homeless. A poor example, surely, this set for the farmers of the State by their representative association.

THE R. N.-Y. "CONTEST" PLOT IN A PICKLE.

ACTING upon the belief that this season would be dry, a part of the "Contest" Plot was planted to early varieties. The vines are now dying, not that it is time for them to mature, but on account of the injury sustained by the Flea-beetle which seems to prefer the foliage of early varieties. Whether late or early, however, there is not a leaf in the entire plot that is not more or less perforated by this destroyer. So much rain has fallen that the soil is saturated and it is probable that rot will be the consequence, as the early potatoes must remain in the ground until the late kinds mature and all shall be dug before the judges in September next. It may be feared that the R. N.-Y. "Contest" Plot is in another pickle.

SPECIAL NOTICE.

IN reply to inquiries we may state that the inner portion of the flowers of the potato R. N.-Y. No. 2 is a light purple. This purplish color covers irregularly about *half* the corolla. The outer portion is nearly white. The proportion

of white and purple is shown in the illustration which was carefully drawn from nature. This variety *never bears solid white* flowers. The stems also are, here and there, *tinted* with purple. They are long-jointed and branch less freely than do most other varieties.

SELECTING THE BUTTER COWS.

THE "discussion on Fallacious Tests In The Dairy," page 509, is worth studying in connection with the recent articles entitled "Is Cream, Cream?" How are we to pick out our best cows? How are we to tell that the butter from one cow costs less than that from the cow in the next stall? It is very evident that we must find out in some way before we can conduct the dairy business on the scundest business principles; but how is it to be done? That is the point. We want a method that will prove sure, simple and easy, otherwise the farmers who most need it will not touch it.

A friend sends us the following table which he says contains a record of tests made at the last Bay State Fair:

BREED.	MILK. POUNDS.	CREAM SPACES.	BUTTER. OUNCES	BUTTER PER SPACE. OUNCES.
Devon	17½	8	11	1.37
Holstein	19½	10	11	1.10
Normandy	19¼	9½	7½	0.79
Swiss	16¾	10	11	1 10
Guernsey	18¼	9½	15½	1.63
Jersey	18¼	14	16	1.14
Ayrshire	18¼	11	13½	1.23

It seems evident from this that the dairy breeder in order to make sure of the worth of his cattle, must go beyond the amount of milk and the amount of cream, and know how much butter can be taken from the churn.

"*Agricultural schools that will do for the farmer what West Point and Annapolis do for the soldier and sailor, will soon be crowded with pupils who will justify their existence most completely.*"—DR. HOSKINS, page 507.

ANTI-DRESSED-BEEF LEGISLATION.

A CASE to test the constitutionality of the Minnesota "dressed-beef law," is now on trial before Judge Blodgett of the United States Circuit Court. The law was passed last April and prohibits the sale of dressed meats within the State unless the animals to be killed have been inspected alive in the State within 24 hours of slaughter. An attempt was made to pass a similar law in the legislatures of 19 States; but the attempt succeeded only in those of Minnesota, Indiana, Colorado, and New Mexico. The Chicago beef-packers say that if the law is upheld it will cause a serious decrease in their profits, and maintain that such a law is unconstitutional because it interferes with the provision of the Federal Constitution giving Congress the exclusive right of regulating commerce between the States, and they also claim that it infringes on the privileges and immunities granted to citizens, and is in restraint of trade. The Big Four contributed liberally towards lobbying to defeat the law before the various State legislatures, and they are now using their best efforts, regardless of expense, to obtain judicial decisions against the constitutionality of the law in the States where it was enacted. The Indiana law was declared unconstitutional by a State Court the other day, but jurisdiction in such matters properly rests with the United States Courts. Whatever may be the decision of Judge Blodgett, the case will certainly be appealed to the United States Supreme Court, so that it may be three years before a final decision is rendered. A legal contest for large stakes between the general public and a combination of wealthy corporations or individuals is likely to be strenuously carried on by the latter to the end.

YIELD OF THE R. N.-Y. WHEATS.

THE R. N.-Y. cross-bred or hybrid wheats yielded, omitting fractions, as follows:

No. 2, one thirtieth of an acre, 1½ bushel or at the rate of 45 bushels to the acre. No. 3, one-fortieth of an acre, 66½ pounds or at the rate of 44 bushels to the acre. No. 50, one-thirtieth of an acre, yielded 73 pounds or at the rate of 36 bushels to the acre. No. 51, one-twentieth of an acre, 81 pounds or at the rate of 27 bushels to the acre. This plot was injured by chickens. No. 53, one-twentieth of an acre, yielded 100 pounds, or at the rate of 33 bushels to the acre. No. 55, one-fiftieth of an acre, yielded 40 pounds or at the rate of 33 bushels to the acre.

The entire plot was plowed last August after 10 loads of stable manure had been spread to the acre. It was then harrowed and at the rate of 1,000 pounds of high-grade fertilizer was sown. The land was then harrowed until it was level and fine. It was then carefully marked out both ways in drills one foot apart, and a single kernel planted an inch and a-half deep in the intersections. This was done between September 3d and 10th. As soon in the early winter as the ground was frozen hard enough to bear, the plots were mulched with stable manure at the rate of about 12 tons to the acre.

It should be stated that this piece of land is naturally very thin and poor. It had not been cultivated for 16 years or more and was deemed too poor to yield a profitable crop of any kind. The weeds growing upon it were chiefly brambles and briers.

"*If we call a pound of butter fat worth 20 cents, this means that two farmers bringing such cream should receive $3.80 and $4.70 per hundred pounds respectively, instead of $4.25 each which they would receive under the polite system of robbery so prevalent in cream-gathering factories. By this system one man is overpaid by 45 cents per cwt.; the other underpaid by 45 cents—a total discrepancy of 23 7-10 per cent. of the actual value.*"—PROF. WHITCHER, page 510.

BREVITIES.

SOMETHING of a startler on the question of "A Tariff on Bananas" next week.

THE R. N.-Y. wants a seed-ball or so of its No. 2 potato which never sets fruit at the R. G.

THE R. N.-Y. knows of a farm hand that is so lazy that even when standing up he is unwilling to make the effort to sit down.

THE R. N.-Y. is told of a locality on Long Island where water-cress farms are being established. The industry is said to be profitable.

READ what is said about the cultivation of blueberries in this issue. If you have ever tried to cultivate this fruit, let us know your experience.

SALT mackerel is a very agreeable winter food for many farmers. The price for the fish promises to be high. The "catch" this year is very light.

Do you pasture your meadows after mowing? This is a topic the R. N.-Y. wants to discuss. Is such pasturing harmful and how much damage is done?

THE Colorado potato beetle has been observed in Central Mississippi this year. It is said that this pest has never been noticed so far south in that longitude before.

IT will be noticed that Texas stockmen find profit in feeding boiled cotton-seed. If English farmers can afford to feed cotton-seed meal, American farmers can afford to feed the entire seed.

"YOU will do genuine missionary work if you follow up this matter of experiment stations abusing the funds given them to work with. There is no doubt that this trust is being and has been abused in some cases, and it ought not to be, as I am sure the major part of the station workers thoroughly believe it should be honestly expended" So says one of our foremost young Professors of Agriculture in a note to the R. N.-Y.

Various.

CORRESPONDENTS' VIEWS.

ANOTHER CONTEST PLOT.—I feel quite proud of the prospect for my Potato Contest Plot so far. The season has been very good for potatoes. We had enough cool showers to keep them growing without need of irrigation until they were in bloom and beginning to set. Then one irrigation was all they needed. A potato grower near here thinks I have in my plot the best prospect that he has seen in the county. Potato beetles are plentiful, but with the sprinkling of a solution of Paris-green twice, they have been kept from damaging the plot. At present the vines (rows three feet apart, 10 inches in row), completely cover the ground. The kinds planted are the Carter and Paragon. In a plot last year they yielded very largely.

Fort Collins, Col. E. H. S.

CULTIVATING POTATOES IN NEBRASKA.—For raising potatoes I plow the ground reasonably deep; then harrow until the soil is thoroughly pulverized, then with marker lay off the land in rows three feet apart. Then with a small pair of mold-board shovels on my cultivator set three feet apart, I go twice in a row making a nice furrow. Then I drop the potatoes, which are cut in small one to three-eye pieces, one piece in a hill. Next a one-horse cultivator with a wheel on one end and two shovels behind does the work completely. Just before the vines appear I harrow and do so again once or twice after they are up. Then I use the cultivator three or four times, hilling up very little.

Phelps County, Neb. W. H. A.

A HANDY WEEDER.—With a cold chisel, cut six inches from the point of a worn-out scythe; then cut two inches of the blade part off the back; put on a light handle; then bend two inches of the point on a curve so that the point and handle will be at right angles, and you will be surprised to see how handy it is.

Birmingham, Conn. G. W. D.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

WHAT WOMEN ARE DOING.

THERE are 60 women among the 16,000 dentists of the United States.

* * *

IN Detroit, 2,700 women registered to vote for school directors, and they have elected a woman to the school board.

* * *

THE California legislature has passed a bill permitting women to vote for school trustees. A bill giving full municipal suffrage to women was defeated in the Senate by a close vote, 15 to 18.

* * *

IN British Columbia, where single women and widows have had municipal suffrage for many years, a proposition was lately brought before the local parliament to make them eligible to municipal offices. It was defeated by one vote—six to five.

* * *

SAYS Daughters of America: "A peculiar fact about American literary women is that many of them are domestic in their tastes and have great ability as housekeepers. Lucy Stone is a noted home-maker. Mrs. Elizabeth Cady Stanton's domestic propensities are well known. Mrs. Annie Jenness Miller, the lecturer and advocate of dress reform, has a husband who worships her. Mrs. Livermore, the lecturer, is another good housekeeper, and in addition to her public and private duties takes care of an invalid daughter."

* * *

THE plan of the Brooklyn training school and home for young girls is to take girls between the ages of 12 and 18 years, who have been left to their own exertions to earn a livelihood, and train them in various occupations; in addition to this, positions will be provided for them. Fifteen prominent Brooklyn women have this matter in hand, and have already been assured of assistance. A building has been secured on Pacific Street, where the home will be established for the first year.

* * *

A NOVEL savings society has been started in Salt Lake City. Two sisters named Mather, in their desire to help sewing and servant girls, suggested saving by depositing small sums each week, and a society was formed, each member agreeing to take a share, and deposit 25 cents each week in the bank. When the whole deposit reaches $200 or $300, it is loaned on a mortgage, at good interest. Some of the girls take two or three shares. Business men, who have been consulted, have become interested, and help the girls in making their loans. This is a sample of what may be done through small savings. Merchants point to the fact that nearly all the gew-gaws brought to the city are purchased by servant girls, who seem to have no desire to save their money, and they think this society will correct this common practice of useless expenditure. All the work of president and secretary is done gratuitously.

* * *

FRANCES POWER COBB is an exponent of so-called Woman's Rights, but she says that the making of a true home is really our peculiar and inalienable right—a right which no man can take from us; for a man can no more make a home than a drone can make a hive. He can build a castle or palace, but, poor creature! be he as wise as Solomon and rich as Crœsus, he cannot turn it into a home.

* * *

SAYS Daughters of America: "Let our girls become really thorough saleswomen, both wholesale and retail, even if it comes to traveling; let them practically learn printing, engraving, designing, light cabinet work, stenography, book-keeping, watch-making, goldsmithing, dress-making (at which the practical woman sometimes makes a fortune)—any of the hundreds of things for which their nimble and delicate fingers, native wit and taste, quick perceptions, and faithful perseverance fit them—and let them learn it as a business, thoroughly, honorably, with a determination to be first-class work-women, and soon they will share the pay as well as the work of men. And our girl will be no less fitted to be a good loving wife and mother, if she sees fit to marry; and she will not be driven into a thoughtless marriage to escape the drudgery of earning the pittance which will not support her, nor of making a sacrifice, which is generally considered to be even more disgraceful than that. Think of this, you who bemoan the thousands of unhappy marriages and the frequency of divorce. And if she is left, as many women are left, with children depending on her for support, she is in no worse condition than the widower who is left with them to care for. Think of this, you who may be widows.

Some men have objected to this idea, saying that if women are self-supporting they will not care to marry. Surely if a man depends upon his money alone to attract and keep her, the time has arrived when woman should compel him to make himself worthy of her love and possession."

* * *

THE same paper says, that if parents would teach their daughters that they have equal rights with their sons, and that they must insist on having those rights treated with the same respect; if they would teach them about our national government, instead of giving them novels to read; if they would teach them trades, whereby they might become self-supporting; if they would teach them independence in thought and action—we would have fewer unhappy women than we have now."

ABOUT VACATIONS.

OLIVE E. DANA.

IT is with vacations as with many other things in this world of ours, those who need them most are not always the ones who get them.

Yet I wonder if it isn't sometimes the fault of the stay-at-homes themselves. And "vacation" doesn't necessarily imply travel,—does it?—though indeed one might think so, from the very general use of both the word and the thing.

Why could not a busy person, (who was also a weary one) determine to get all the rest, change, refreshment, and pleasure that should come in her way (for we will suppose that this busy and tired person is a woman and a housekeeper) for a certain period? Why should not such a one person promise herself that she would make each day's tasks, for a few weeks, as few and light as should be consisent with household comfort, securing to every hour the solid rest possible to her, and enjoying every little outing or bit of pleasure that should come in her way? Would such a resolution be selfish, either in its spirit or its fulfillment? Would it not rather be not only for her own good but the good and pleasure of others, in its consequences? There are force and truth in a late editorial utterance of "Zion's Herald." "If it is felt that the daily round of duty *must* be made, then the toiler is becoming unconsciously an automaton and this is the first approach of mental imbecility and physical paralysis."

There are wont to be, in every path, little pleasures which we slight because of their littleness. Yet they make a great difference—plus or minus as we may make them—in the sum total of comfort. The short drive, even if it be wedged between bits of housework, the longer one that a free afternoon affords us, the calls on old friends, the day's visiting, the renewal of old acquaintance with nature and human nature, the stroll to the river's brink, the walk in the meadow when the grass is mown, the excursion down the river, the neighborhood tea-party or picnic, all these are not to be despised or forgotten as factors in the problem, "how to get a vacation." And I sometimes think the people who take vacations, and whose work both allows and demands them, have it in their power to determine quite largely whether certain other folks whose occupations are quite different, shall have a taste of summer leisure and pleasure or not. I heard of a pretty plan the other day. A young lady teacher, just released from wearing school-work for the long vacation, and herself not unworn by it, had had hardly a week of freedom before she gravely invited her mother, on whom fell naturally the burden of home-work and care in their little household, to visit her for a week.

She, the daughter, was to manage domestic affairs and do the housework, and the mother was to be her guest.

I wonder if some tired women, on whom fall far heavier and steadier tasks than this mother knows, would not be glad of such a vacation? And I wonder how many daughters would be thoughtful enough, or tender enough, to give it to them?

Speaking of vacations, it occurred to me the other day to look up the meaning of the word.

It comes, as I had guessed, from the Latin, from *vacatio*, which is again a derivative of the verb *vacare*, to make empty or void.

And accordingly, the first definition Webster gives of it is, "the act of vacating, making void;" and the second, "freedom from interruption, trouble or perplexity; leisure."

I don't quite like the suggestion of emptiness about the primary meaning of the word; yet, doesn't it well describe some vacations we have known of, perhaps some we ourselves have taken? And were they not wearisome and disappointing? Were we not glad when they were ended? I think, really, that the vacation or visit which one crams with work she had no leisure for before, writing articles that have haunted her, letters that should have been sent long before, reading "solid" books, or doing many pieces of sewing or fancy-work: I think such a "vacation" is far more enjoyable and restful, and more conducive to health and happiness than the "empty" sort. Between the two, however, lies the golden mean. Who is so wise and fortunate as to find it?

Meanwhile, can we not be seeking it during the mid-summer heats? And if the longer leisure of weeks of rest and recreation and travel is denied us, shall we not be taking all we can, in installments?

HOW TO KEEP WELL AND HAPPY.

MRS. S. H. ROWELL.

"I WONDER who is sick at Mr. Jeffords?" said Mrs. Bly, as she glanced out of her sitting-room window when closing the blind, "the doctor has just gone in there."

"It seems to me as if they had a great deal of sickness this summer. I really believe the doctor has been there as often as twice a week ever since they moved here," remarked Mr. Bly. A quick step on the back porch interrupted them, and Mrs. Jeffords opened the door. She was in a flutter of excitement.

"Have you any dry mustard, Mrs. Bly? Mr. Jeffords and the boys are both terribly sick; I think they must be poisoned."

Mrs. Bly hastened to get her box of mustard, and as she handed it, inquired with anxious sympathy.

"Can we do anything to assist you, Mrs. Jeffords?"

"Oh, if you would only come over—I am so nervous and tired." So she went over. Mr. Jeffords lay upon the sofa, retching and writhing with pain. The two boys had pillows on the floor, and were evidently suffering a great deal. The baby was crying in the cradle, and the family physician had Mr. Jeffords's hand in his, feeling his pulse; while an anxious expression rested on his face. It was evidently a most distressed family.

"What is the trouble, Doctor? What can I do to assist?" asked Mrs. Bly.

"I want some mustard plasters spread as quickly as possible. It seems like a case of poison. They were all well before noon."

"What could they have taken to affect them so terribly, Doctor?"

"I have not ascertained yet. I wish I could get them to throw up."

"Some mustard stirred in warm water, is a good emetic."

"So it is; suppose, Mrs. Bly, you prepare some as quickly as possible." She did so, and spread the plasters on the pits of their stomachs. The emetic operated quickly, and Mr. Jeffords began to be relieved, and the little boys grew more quiet, and finally dropped to sleep.

"Doctor, what on earth ails us; can you tell? I was as hungry as a bear when I came in to dinner; the boys were not home from school; but I did not wait, and was nearly through when they came in. My wife said she was too tired to eat; and she is not sick, you see; so it is something we have eaten."

"Yes, probably. What did you have for dinner, Mrs. Jeffords?"

"Baked fresh pork, turnips and potatoes, with bread and butter. I was ironing all the morning, and was so tired that I could not eat."

"Don't you think, Doctor, it was the fresh pork? I do not think it a very safe article of diet in hot weather," said Mrs. Bly.

"I don't know really. This family are predisposed to sickness. I am afraid there is something about the premises that is not as it should be. We eat a good deal of fresh pork at our house."

The sick ones seemed so comfortable after a little space, that the physician left, saying he would call later in the evening.

Mr. Jeffords remarked, after he had gone, that he had done nothing at all for them, only felt their pulses round, while Mrs. Bly gave all the medicines, and prepared them, too.

"Now, really, Mrs. Bly, what do you think was the matter with us?"

"Well, I think it was the meat you ate. I do not think you were poisoned, and of course the vegetables were harmless, unless you put in too much butter to make them good. We never eat fresh pork in hot weather, as we do not think it safe. Indeed we eat very little fresh meat of any kind. Eggs, rice, nice bread, berries fruits and vegetables are our living, with an occasional meal of dried beef or salt fish cooked in a cream or milk gravy."

"Don't you use meat at all, in your family, Mrs. Bly?"

"I boil a bit of salt pork with my beans, peas and cabbage, to give them a relish, and Mr. Bly sometimes eats a bite; and once in a while I broil a little ham to have a change," she answered.

"You cook chickens and turkeys, I suppose then?"

"Not during the hot summer months: they are so apt to give one colic or bowel complaints in warm weather, but we use them plentifully in cold weather, as well as meats of all kinds. We use salted fish in the summer, and this plain diet seems to agree with us all, for we keep hearty, well and happy."

"I know you do: you never have a physician I see. We have to call in a doctor 20 times a month, I expect," said Mr. Jeffords, as he rose from the sofa. "I think you were right, that it was that meat that made us sick. I will leave word and that doctor will not need to call again, and I'll save one bill! And if we can all keep as well and happy as your family are, I would never buy another pound of meat."

"Mr. Jeffords has often said he wished our children were as well and happy as yours. Ours are sick so much that they can neither feel well nor happy," said the poor mother, sadly.

"Allow me to tell you wherein the difficulty lies, or at least where I think the trouble is; you will not be offended?"

"Offended! No indeed! I wish you would, for I am worn out taking care of sick children; not to speak of my own poor health."

"In the first place, you use too much lard and butter, in your cookery; you make and eat too much rich cake, and you give the little folks too much candy and sweet-meats. They are always eating either cake or candy. You do not think of it; their little stomachs have no chance either to digest their food or to rest. They cannot feel well, and consequently are not happy. If you and your husband would think about it, you would see for yourselves that it is an injury to keep children surfeited on sweets, and the less meat they eat in warm weather, the better they will feel. I am glad you have all got over this attack so quickly, and I do not fancy you will get 'poisoned on fresh meat again this summer, especially on fresh pork. The lighter the diet one gives children the better; I saw the doctor did not accept this idea of the cause."

"I expect he likes business, but it is pretty costly business to employ a physician as much as we have always done," said Mrs. Jeffords.

"Yes, it is much pleasanter to keep well, and we shall all be happier for it."

GOLDEN GRAINS.

IN reply to a correspondent, the Journal of Commerce says that nothing is more difficult of explanation than the mental process by which a person of respectable exterior and presumed good judgment will justify himself for standing in a crowd of people on the platform of a car or ferryboat, or in a waiting-room, and puffing from his lips the smoke of a cigar or the foul fumes of a cigarette, when he cannot fail to see that the discharge goes directly into the face of some other person. We see this every day, and it is one of the marvels to be found in a civilized community.

A SUBSCRIBER sends in the following illustration of childish faith and love: "After kissing my little four-year-old daughter, (who had but recently lost her mother) good-night, I observed that she kissed her hand and then threw it upward. I said to her: 'Jennie, what are you doing?' She replied: '*I threw a kiss to mamma.*'".....

SIR WALTER SCOTT said that guilt, though it may attain temporal splendor, can never confer real happiness. The evil consequences of crime long survive their commission, and, like the ghosts of the murdered, forever haunt the steps of the malefactor. The paths of virtue, though very seldom those of worldly greatness, are always those of pleasantness and peace. .....

BEECHER said that the great art of managing a congregation lies in this: be good-natured yourself, and keep them good-natured, and then they will not need any managing...

THE wide pasture is but separate spears of grass; the sheeted bloom of the prairies but isolated flowers. However small, that cannot be insignificant individually without which greatness would not be great, nor beautifulness beautiful.....

THE man whose eyes are wide open in seeing the faults of others, and scarcely open at all in seeing his own faults, is very sure to commit two mistakes—one in not correctly judging of others and the other in not correctly judging of himself. Such a man is apt to be a sort of nuisance in every circle in which he moves.....

A GRAVE error of far too many mothers consists in the fact that they educate their daughters to make a show and a dash, as the way to get married, rather than to be good and competent wives after they are married. This is a very serious mistake in female education, and, withal, entails a great many evils upon the married life. No young woman is really fit to become a wife who is not practically qualified for the duties of the position..

A MINISTER narrates the following: While walking along one of the London streets a Paris pastor came forward and accosted me thus: "Excuse me, but were you not in Paris some time ago?" I said: "Yes, I was," and then he inquired: "Did you not, in one of your addresses there, say that the *latch was on our side of the door*?" "Yes, I believe I did say so," I replied. "Well," he answered, "I always thought it was on the Lord's side, and I kept knocking, and knocking, until I heard of your words, and what a joy came over me! I lifted the latch. Since then all has been changed; my church, my congregation, my work, and every thing about me!" Oh, remember that the latch, is on your side of the door!.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

EXTRACTS FROM SUNDAY-EVENING TALKS AT THE RURAL GROUNDS.

CERTAIN MORAL AND SOCIAL ACTS IN THEIR RELATIONS TO THE DEMANDS OF REAL FRIENDSHIP.

CHRONIC PROFESSIONAL VISITORS. "Something for Nothing" might well be given as the name of a certain sort of friendship that recognizes its obligations by a never-failing polite but indolent courtesy. There is always a gentle, apt, refined reply for all favors. "So good of you" —— "So thoughtful" —— "Pray do not let me put you out" —— "I'm troubling you so much and you take it *so* kindly." These sponges whose politeness is only equaled by their inertness, seem to assume that a polished recognition of the services rendered them is a full equivalent; that gracious manners, oily tongues, well chosen words of flattery weigh heavily against the trouble they cause. The demonstrative evidences of well-bred and easy manners, of skillfully spoken compliments have a value that pleases the ear and tickles the vanity for awhile. But they are too volatile. One soon demands a trifle of substance to help him on. There is too much fine crockery and china about the thing; too little of a solid dinner. The lunch is rather *airy* and one suffers the "gone" feeling before another meal.

Many people of this class, if judged by their smooth, careful words, seem to be models of modesty and appreciation. As a matter of fact, they are the boldest, most selfish people in the world. Don't you know of such people? Complacent, easy-going, bound to be happy, always wearing a smile; always full of grace and kindly, sympathetic words and ways—they come to your house, and though *seeing* and *feeling* that they *are not, can* not be welcome, squat themselves down, stay as long as they like and never turn a hand to help or to lessen the work of an already overworked household. They have repaid us in the coin of their sprightly conversation, of their gracious behavior and in their parting words: "You have been so kind and considerate; I have enjoyed my visit *so* much; I wish I might reciprocate in my own home; I shall hope soon to visit you again," and so on.

My own family has suffered from these incubuses as long as I can remember. I recall no less than four lustrous specimens of the genuine type, the sight of any one of whom as he entered the house would cause a cold chill and a hopeless feeling to take possession of all. Such leeches do not inspire any depth of friendly regard. They have no real friends, because there is no such thing as a mutual friendship without mutual sacrifices. Still they seem to get through life comfortably, live to an everlasting age and die with all the easy, indolent complacency that was their chief characteristic through life. While we may despise this kind of life, most of us accord a certain amount of respect for the gentle astuteness; for the amiable cunning; the ready faculty of repartee, the dignified indolence that with so little apparent effort secured them a livelihood. It is a question whether the people or families who are afflicted by the considerate regard of these affectionate and harmless tramps are entitled to any sympathy. If we are overwhelmed with visitors, we have no one to reproach but ourselves—and the more uncongenial those visitors are, the more we are reproachable. It is an act of hypocrisy to extend the same welcome to unwelcome people that we would extend to those whom we consider true and worthy friends; those who by ties of blood or for services rendered have a real claim upon our regard.

OURS AND OTHERS.

We have often heard the remark when disputes have occurred in which one's wife or husband was a main actor, "Well, I could not go back upon my wife." Or, "I couldn't openly decide against my husband, though he was plainly in the wrong." We have all of us had occasion to observe that the mother is prone to shelter her beloved daughter or little boy as against some one else's little daughter or boy. One or the other has told a lie or committed a theft. The evidence all points to our own child as the culprit. Do we pin him down as closely; do we scold him as vehemently; do we punish him as vigorously as we would have the other boy pinned down, scolded and punished if HE were the culprit?

Suppose that *your* darling little boy—your BEAUTY-boy—picks a muss with Charley Peck and Charley blacks your darling's eye and causes his nose to bleed. Are not we inclined to cut Mr. Peck in two before we have instituted a fair trial to ascertain which boy *caused* the disturbance! Suppose that your husband comes home with his ambulatory rectitude sadly impaired, would you speak of this little matter as freely and censoriously to your neighbors as you would tell them that your friend Isaacsen or Rosy-Morn returned in the same exhilarated condition?

Let us suppose that you love your wife and that you dislike Isaacsen's wife and that these two women quarrel, each making such grave charges against the other that a public investigation becomes necessary. Would you —*could* you decide against your wife! The case might be so serious that such a decision would forever cast a shadow upon the family name.

Now does love for individuals lessen our moral obligations to others! Is *your* child or husband or wife entitled to any more consideration than any other child, wife or husband!

We are all children of God. Do you think that He would discriminate against or in favor of any of us!

He is our *perfect* friend. It would therefore seem that, if we decide the question raised by *His* teachings, the wife must raise her hand to strike her own loved husband or idolized child just as relentlessly as she would to smite those whom she may dislike but who may be just as dear to others.

And there can be no such thing as a real, true friendship between two individuals either of whom would seek to protect the other from merited punishment or disgrace. If this be the truth, it seems a hard, cruel truth when first considered. It is not improbable, however, that the greatest sins and injustices of the world, millions of examples of which are being committed or enacted daily, are those which have their origin in the power of the strong over the weak. The murderer escapes the law's just punishment because he can pay $1,000 or more for noted lawyers; for false witnesses; for powerful influences both of people and of the press in his favor. Powerful monied combinations command services at their own price, and when 10,000 people are killed by the breaking away of a dam, no one is found responsible; when hundreds are smashed to pieces or burned to death by the culpable negligence of incompetent railway officials, or smothered to death in a coal-pit, no one is found punishable. In smaller instances, the employed are generally at the mercy of the employers. The hired man said what was assumed as disrespectful language to the wife. The gallant and indignant husband nearly chokes him and then kicks him off the place without ever having *asked* for the hired man's story.

Two clerks quarrel. One is a highly valuable clerk; the other of little or no account. How many employers will give a careful, just hearing to the good-for-naught if a just decision is to deprive them of the services of the one they cannot well get along without? We owe to every living person, modified in degree, every feeling, every consideration that is entertained for or extended to the nearest friend, and it is difficult to see how any one who is indifferent to the sufferings, misfortunes; to the comfort and well-being of those with whom he comes in contact, either in social or business life, will prove a real true friend to any single individual.

Any man or woman who will act unfairly to those in his or her employ will act unfairly to his children, wife or mother under equivalent provocation. Now, dear little Trav., to make this principle plain to you as well as to the rest, let me say that if Papa would not scruple to take an unfair advantage of Mr. C. or of Miss C., both believed to be earnest and honest assistants in his business, he would under intenser provocation be unfair to you, to Cerise or to Mamma.

And so, on the other hand, if you are capable of a meanness to Tommy Brown, of bullying Johnny or Mamie to induce them to serve you; of soft-soaping Uncle John to induce him to permit you to shoot his pigeons, you are equally capable of acting in just the same way towards your parents when you have an urgent wish to gratify.

HIRE ALL THE HELP YOU CAN AFFORD.—Many of our most effective workers act upon the rule: "Never do a stitch of work that you can hire or induce another person to do as well." It is a wise rule and one upon which the harmony of the universe depends. Larger insects prey upon smaller ones and parasites prey upon all; stronger fish eat up the weaker ones; the larger and more powerful of the lower animals, seemingly without the slightest sense of piety or justice, devour the weaker animal according to their whims or necessities and *man* according to *his* whims or necessities destroys or devours them all. Little moons and stars revolve about greater ones and the greater ones still about greater ones until, in so far as can be judged when we consider infinity of space, universe revolves about universe. In the vegetable world, a similar law governs all—the weaker is ever succumbing to the stronger and the "survival of the fittest" is the apt phrase that expresses the relations between servant and master. Every one serves, be he master, servant or slave. We are mutually dependent—the one upon the other—and all living things; all inanimate things; all things are alike dependent upon certain mutual continuous relations. The necessities of our nature imply destruction. We cannot move or think or act except by the power which destroys something. It is by destruction that we live; that we are warmed and fed; that we study, learn, teach, worship, hate or love. Did you ever think how many living creatures each one of us necessarily destroys every day in plowing and cultivating the land; in our war against insects injurious to vegetation, as we put it; in walking, in breathing, in building our houses, in constructing and running our railroads, in eating and sleeping?

Some one must be the hod-carrier; some one the mason; some one the builder and some one the superintendent. Then some one must employ them all and furnish the means to pay for their services. We have the wash-woman, the kitchen-girl, the up-stairs girl, the maid of all work. We have the errand boy, the counter jumper, the floor-walker, the book-keeper, the cashier, and members of the firm. Do *you* excel as a wash-woman, a cook, a salesman, a book-keeper? Do you excel as a hod-carrier, mason, boss-mason? Then that's your place. If a hod-carrier, do your work faithfully and don't do one stitch of work that you can hire or induce another to do. If you excel as a cook, there's your place. If you can render better service by buying your clothing, by employing dress-makers by all means do it. In this way you help to support others while rendering yourself more efficient in your chosen work. *No one can afford to spend his time upon less valuable work which others for less pay will do as well or better.* If you are the mistress of a home, seek to make it an instance of *model*-house-keeping according to your *means*. If by hiring the services of wash-women, kitchen-maids, chamber-maids, you can approach more nearly to perfect house-keeping, hire them *all*. *They* are benefited—so are you—so is your family—so is society. Do *thy* part well whatever it may be. But if by nature and education you are in truth a hod-carrier or a cook, pray do not assume to be a boss-mason or the head of the house. All the hired assistance in the land could not serve to make you the right person in the right place. As soon as you find you are not fitted to your occupation, abandon it, get out of it and set to work to find out what you *are* fitted for and go at that. It is misfits that upset the world. They neither superintend nor follow wisely. There is really no place for them anywhere, and *having* no place they crowd and distort all they touch or come in contact with. The great trouble in the world is that few of us really know our place; few of us are willing to make the exertion and sacrifice which *excellence* demands. *It is far better that I should be an excellent servant than an incompetent master.* We will all grant that. But who is to say that *being* an excellent servant, I would not be a competent master if I had the *chance*? There are too many of us that would rather rule in hell than serve in heaven. There are too many of us that, with little care for the harmony of things and guided by the impulses of the hour or day, and the comforts thereof, care little for the morrow, or the effect of our shortcomings upon those about us. Here we have the class of people that find everything in the world just right-wrong. Friendship! they scout the word. It is a farce. They could tell you for a week on a stretch, of the acts of kindness and liberality they had bestowed upon others not one of which was ever appreciated or repaid—their aim being merely to grind all they could out of them and then kick them out to starve. Is any one entitled to friendship that puts forth little or no consecutive, persevering effort to excel in one or the other of the necessary industries of life! Or is he entitled to friendly regard who fully capable of excelling in some humbler occupation, scoffs and snarls and bites because a higher position, for which he is in no wise fitted, is not thrown at his feet?

A FEW HOUSEHOLD HINTS

I HAVE always voted tidies nuisances. A lovely art square finished with a border of velvet and antique lace is certainly very pretty to look upon, but is never meant to rest against. I have sat down when tired and weary, when it would have done my aching back good to have rested it against the chair or sofa back, but as each conceivable place in the room where a tidy could be used was filled with one of some sort, a bunch of ribbons and laces, crazy, antique, hand-painted, etc., it was impossible. I mentally wished all such trumpery in Hades or some other place. But there are places where a tidy seems like an oasis in a desert! But the tidy must be made of something that is substantial, to be of real use. Suppose we have in our parlor or sitting-room a cozy, comfortable chair, which from this very fact begins to show the ravages of Time. There is a dingy look at the top of the back where many a curly head has rested, where perhaps "grandma" whose snowy locks are now lying beneath the daisies, used to sit for hours at a time. What is to be done about

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children she gave them Castoria

it! The rest of the chair is good, except perhaps a little worn on the arms. Here is where tidies may be used with advantage. But let us have something sensible! Well then, a neat way of making a tidy for the back of such a chair is as follows: Take two equal lengths of pongee silk (it will wash), say one of pale green and one of pink. Turn a hem on each and fasten it down with a row of feather-edge stitching. Stitch the green with pink and the pink with green. One end of each strip may be raveled out and a knotted fringe made. Knot the two lengths together loosely and throw carelessly over the shabby place; only be sure and tack it fast in several places so that it won't fall off the minute one sits down.

A pretty tidy may be made of Holland linen. Cut the desired size, trace some pretty design, such as a spray of apple blossoms or wild roses, diagonally across it, and outline with wash cotton. Fasten to the chair back with bows of ribbon to match the cotton with which it is worked. This is certainly a sensible tidy as it can be washed as often as is necessary.

Turkish towels come in very pretty colors, such as pale pink, blue, lemon, etc. Let me tell you, fair reader, that these make lovely tidies for sitting-rooms, bed-rooms, and the like. Catch the towel in the center and tie it with a bow of ribbon to correspond with the predominating shade in the towel. Then fasten on the back of sofa or chair as one does scarf. These, of course, can be washed as often as one chooses. Should they fade they can then be used for the bath-room and new ones put in their places. Very pretty ones can be bought for from 25 cents to 50 cents. Ribbons that have become a little crumpled and look scarcely fresh enough for your personal adornment may be made to do service as ornamentation for the above.

* * *

PRETTY sachet bags may be made as follows: Take two equal lengths of contrasting ribbons. Lay them together, cord to cord, and with an open button-hole stitch join them together, leaving about three inches loose at each end. Then double them back to form a bag, leaving the under ends a little longer than those meant for the top. Then button-hole stitch the sides together. Next fill them with cotton, placing your sachet powder therein. Tie together with narrow ribbon where the loose ends begin, making a dainty little bow. We made one last Christmas of the following: A half yard each of pale blue and delicate pink ribbon about 3½ inches wide, fastened together with dark cardinal floss and tied at the top with pale-blue bows. The loose ends were dove-tailed—two being longer than the other two. Heliotrope perfume was selected. If one has artistic ability a spray of wild roses or daisies may be painted diagonally across the two strips of ribbon, adding thereby a graceful finish. Or, if one prefers, the spray may be embroidered in floss.

* * *

PRETTY reminders of our summer's vacation may be made as follows: While in the fields or woods gather any pretty or oddly-colored leaves, a cluster or so of clover or daisies, a few grasses or ferns, and lay them smoothly between the leaves of a book to press. After you are at home again take them out and fasten with a little mucilage, on a square of Whatman's drawing paper. Arrange them as artistically as possible; then mark across one corner the date when, and the place where gathered. They can be framed in nice little frames of oak at a trifling cost. These make very pretty ornaments for your bed-room or library, and are pleasant reminders of your summer's jaunt.

* * *

I HAVE just ebonized a plain little wooden stand and my handiwork is such a satisfaction to me that I will tell you how it was done: First, I sand-papered the stand thoroughly, then brushed the wood several times with a strong, hot decoction of logwood chips. When dry, a coat of vinegar, in which rusty iron had been soaked, was given it. Then I applied beeswax, thoroughly dissolved in turpentine (this can be done by setting in a very warm place). The wax must be *warm* when applied. Then rub till a good polish appears.

* * *

A DISH of charcoal placed in your meat larder will keep the articles sweet and wholesome almost as well as ice. Charcoal is a great disinfectant. If occasionally used for cleaning the teeth, it will sweeten the breath when everything else fails to do so.

* * *

To wash windows and make them clear and bright, use ammonia and borax, but no soap.

To wash glass tumblers, etc.: They can be made brilliant by washing with strong tepid soda-water, then rinsing in clear, cold water, and drying with a linen cloth without nap.

* * *

LEMONS can be kept fresh for many weeks at a time by putting them into a clean, tight jar or cask and covering them with cold water. Keep in a cool place out of reach of the sunshine or light, and change the water often, not less than every third day—every second day would be better.

* * *

SMOKE-STAINED lamp chimneys can be cleaned with salt. Wash them first with warm water and soap, and, while wet, rub them well with dry salt. Vinegar will also remove the stains.

* * *

IF you have many brick paths about the yard and doorways you are doubtless troubled by their becoming green and slimy during the rainy weather we have been having. If you find that hard scrubbing does not remove the green stains, get some "Venetian Red" from the druggist's (it can be bought for five or six cents per pound. Two pounds will do a considerable amount of paving), and color the paths. First wash off the dirt, then sprinkle the powder lightly over the bricks and distribute evenly with a wet broom. This makes them a bright, brick-red. By doing this twice a month you can keep your paths in very good condition. This has also another virtue. It fills the interstices between the bricks and prevents weeds and grass from growing in the paths.

* * *

IF you have a damp or dark cellar keep chloride of lime sprinkled about at all times. It not only purifies it, but will be a sure preventive against snakes, which so often find their way into the wood-pile. Gather pennyroyal and scatter it about the house, under beds and into closets. It will kill "things that walk by night" such as roaches, bugs, mosquitoes, etc. If troubled much with mosquitoes, moisten the hands and face with liquid camphor on going to bed, and they will not molest you at all. I have lain awake and chuckled to myself over and over again as the vile little things sang their songs about the room, knowing full well that they dared not touch me.

DORA HARVEY VROOMAN.

PREPARING AND FILLING GLASS FRUIT CANS.

SEE that each can is perfect. In new cans shake either shot or an iron dish-washer to remove any small pieces of glass. Sweeten old cans by rolling them in cold drinking water. For many cans as are to be filled at one time, have as many pieces of cloth (pieces of old aprons or anything clean and kept for the purpose) wrung from cold or warm water, no matter which, and wrapped around the cans.

To fill, hold, for an instant, suspended in the can, a spoonful of hot fruit, then shake it about and add a few more, then fill nearly full, and with the can between the hands, give it a rolling movement, which settles the fruit and brings up the air, wipe the top clean, make dry with soft paper, put on the rubber, fill up with boiling juice, add the glass top and the ring (dry or cold), secure to the extent of your muscle, place where moving will not be necessary till cold, and let alone. The cloths can be removed when needed for other cans. When perfectly cold, examine the tops, and if any are doubtful, press down on the glass top, while removing the ring, and if right or wrong you will know it. Wash and wipe dry before putting cans away for good, as sticky cans are not pleasant to handle or moldy ones to look at. For keeping canned fruit, when space permits, a clean cellar bottom is preferable to untrustworthy tables or shelves.

MEDORA CORBETT.

RECREATION FOR HOUSEKEEPERS.

HOUSEKEEPERS as a class surely need recreation as much as anybody; but how seldom do they take it! The daily routine seems to leave no opportunity for pleasure-seeking, and thousands of housekeepers are enduring a monotonous existence with no prospects of anything different. This is certainly wrong. Eating, sleeping, cooking, mending and cleaning are all very useful and necessary as means to an end, but when they are allowed to monopolize life to the extent of shutting out needed relaxation and relief, it is time to call a halt.

No time for recreation? Of course not, if you wait for it; but *take it anyhow*—if not in a nice, big vacation, then in small lots. Take a day at the seashore, the mountains, the falls, the lake, the river, or just the common woods. Don't wear yourself out to prepare an elaborate picnic dinner, but pack up a simple lunch and go,—husband, children and all. If there are hired men, let them have a cold dinner for once. They will live, and thrive too.

Then if John happens to be going to the village or to see a man a mile or two in the country, and asks you to ride with him, don't tell him you really can't, for Sammy's socks must be mended, or the cellar steps cleaned, but put on your hat and go anyhow. Tuck the children around in the crevices of the buggy and be determined to enjoy all you possibly can. The cellar steps and things can wait, and in a week you will never miss the precious hour you took for a delightful, restful drive.

Then, once in a while, if you can't leave home for a whole day in the woods, live out-of doors under the trees near the house, or on the porch. That will please the little people and do you a world of good. If you must work, take your sewing with you. It is just as easy and far more healthful to make button-holes and darn socks in the sweet out-door air as to do the same work in the house. Don't let housework, however important, make an utter slave of you. I once knew of a lady with such a mania for cleaning that her sole object in life seemed to be to keep her house spotless. She swept and dusted, scrubbed and rubbed, scoured and washed from morning till night. She would follow her husband over the house with a cloth to wipe up any possible dirt or dust that might lurk in his wake, and altogether made his home life miserable by her endless devotion to her idol. Her husband, a well-to-do business man, owned a fine horse and carriage and often wished his wife to drive out with him, but she could never stop cleaning long enough, so his neighbors got the rides and she staid at home, a perpetual slave to the scrubbing-brush and wash-cloth.

If you cannot take real recreation take your work in a recreative way. Sit out on the porch or under a tree to pare potatoes and apples. Shell peas and beans by a cool window or in the hammock and quaff long, deep draughts of heaven's pure air whenever you can. Compel circumstances to yield you enough of relaxation and pleasure to fit you for better living and greater usefulness. Life is short enough and wearing enough at the best; let us all resolve that whatever our occupation, it shall not prevent us from having good times or giving good times to others.

For a
WEAK STOMACH; IMPAIRED DIGESTION; DISORDERED LIVER;
they ACT LIKE MAGIC:—*a few doses* will work wonders upon the Vital Organs, Strengthening the muscular System; restoring long-lost Complexion; bringing back the keen edge of appetite, and arousing with the ROSEBUD OF HEALTH the *whole physical energy* of the human frame. These are "facts" admitted by thousands, in all classes of society, and one of the best guarantees to the Nervous and Debilitated is that BEECHAM'S PILLS HAVE THE LARGEST SALE OF ANY PATENT MEDICINE IN THE WORLD. Full directions with each Box.
Prepared only by THOS. BEECHAM, St. Helens, Lancashire, England.
Sold by Druggists generally. B. F. ALLEN & CO., 365 and 367 Canal St., New York.
Sole Agents for the United States, *who* (*inquire first*), if *your* druggist does not keep them,
WILL MAIL BEECHAM'S PILLS ON RECEIPT OF PRICE, 25 CENTS A BOX.

News of the Week.

HOME NEWS.

SATURDAY, July 27, 1889.

AN effort will be made in the fifty-first Congress to create a new Department of the Government to be called the Department of Public Works, with its head in the Cabinet. It would have charge of river and harbor improvements, geological and coast surveys, irrigation of desert lands and various odds and ends of public business now scattered loosely in various government bureaus. There was a regular hubbub all around among the political papers at the idea of having agriculture, the greatest industry in the nation, represented in the Cabinet; but as yet, not a word of protest has been uttered against the establishment of this Department of odds and ends, shreds and patches.....Boise City has been made the capital of Idaho for 10 years. The first legislature is limited to 18 Senators and 36 Representatives, with power to increase respectively to not more than 24 and 60 ....Judge Johnson of the Porter County, Indiana Circuit Court, has rendered a decision holding that the law lately passed by the legislature against the importation of dressed beef is unconstitutional, on the ground that such legislation is akin to the exercise of power by individual States over inter-State Commerce, and that whatever may be the nature and reach of the "police power" of a State, it cannot be exercised over a subject confined exclusively to Congress by the Federal Constitution. There will be an appeal, of course, to the United States Supreme Court, which will reach a decision—some time. Cases for testing similar anti-dressed-beef laws have also been made up in Minnesota and Colorado.....According to the report just made by the Royal Commission appointed a few years ago on Canadian railroads, railroad construction began in Canada in 1837 when 16 miles were opened for traffic. The total mileage now is over 13,000 miles and the freight carried last year amounted to 17,173,700 tons. The cost of railroad construction in Canada and the "States" has been about the same, and in both it has been lower than in any other country. The cost is highest in Great Britain and France. There's a mile of road to every 470 inhabitants in the Dominion, the proportion is less in the States. The average freight charge in Canada is 93 cents per ton, as compared with $1.04 in the States: $1.50 in Holland; $1.70 in Germany; $2.00 in England; and $2.14 in France. Little comfort in these figures for unreasonable kickers against railroad extortion. After all, isn't railroad unfair discrimination, in reality, the greatest railroad abuse here? ....
A cloud-burst near Parkersburg, W. Va. a week ago together with enormous downpours deluged a wide area, flooded many creeks and caused 17 deaths. The damage to crops was inestimable. Many of the farmers will have to depend on charity next season..... Same time western and central Massachusetts suffered from a terrific thunder storm; many trees and houses and several persons were struck by lightning.....Emmons Blaine son of James Gillespie, is engaged to be married to $2,000,000 and Anita McCormick, second daughter of C. H. McCormick, of reaper fame. Emmons's brother "Jim," as a part of his education in railroad matters, is acting as fireman on a locomotive away down in Maine... .....
The Rev. Father Curley, Director of the Georgetown University, near Washington, the oldest Catholic priest in America, and so far as known, in the world, died Wednesday. ..... The other day while some divers were searching for a recent wreck under water near Cape Henlopen, Del., they came across a cargo of tin and spelter lost on the English bark Medway in 1853. The Atlantic and Gulf Wrecking Company which employed the men, has already recovered and sold a good share of the cargo, and expects to make $150,000 in all out of it. Oh, yes, the discoverers will of course get a share—their wages if nothing more.....In Chicago two claimants appealed to the Court about the ownership of a $15,000 lottery prize, for the purchase of which both claimed to have contributed. The State Attorney has just put in a claim for the whole as a legal forfeit to the State, and the State is likely to get it.. .....Phil Sheridan's Private Secretary from 1875 to 1880 is in jail in Kansas City for horse-stealing.....New York has a two-year-old law pensioning militiamen who are injured in the service of the State. The first award was approved by Gov. Hill the other day. It was the highest—namely $72 per month, and was given to a militiaman who lost both arms and one eye by an accident, while on duty under State orders..... Chicago is to appoint a committee of 100 of her representative citizens to make vigorous efforts to secure the location of the International Exposition of 1892 within her widely extended borders. Washington will grab for all the national boodle in the enterprise when Congress convenes in extra session in October. New York citizens held a large public meeting, Thursday, in favor of the location of the Great American Fair in the Great American City... A fine bed of terra-cotta clay has been discovered on a farm near Topeka, Kansas. The chief beds hitherto in this country have been in New Jersey and Ohio. The Topeka bed, properly worked, will be worth $500,000 a year to that place. Terra-cotta is used almost exclusively for decorative and ornamental work, though drainage tiles are made of a coarse kind ..... There's a movement on foot to establish a Brick Trust with a capital of $15,000,000 in the neighborhood of New York—Pierre Lorillard, who has already over a million dollars invested in brick works in New Jersey, is at the head of the enterprise.. .....There's talk of a Natural Gas Trust to include all the works in Ohio and Indiana. Calvin T. Brice, Chairman of the National Democratic Committe, Oliver H. Payne Democratic Senator from Ohio, and other Standard Oil magnates now own most of the stock in the works and are trying to buy up the few independent companies .....
Mrs. Elizabeth Iliff Warren who made a fortune by cattle-raising on the Plains, has presented $100,000 to the Denver University..... .....Henceforth the Pennsylvania Railroad will carry baby carriages accompanied by their owners, free of charge. The Pennsylvania Railroad is second to none on this footstool.....The Land Office at Washington has decided that the Oklahoma "sooners" must be ousted from their claims, and hundreds have already filed claims on lots occupied by the "sooners"—those who entered the country before noon on April 22. The decision should also apply to town sites. If so, the titles to 650 lots in Guthrie alone will be worthless. Settling a territory in a day is profitable only to lawyers. In Oklahoma the surgeons and grave-diggers were a sadly disappointed crowd, not having got a tithe of the work they had every reason to expect..... W. W. Johnson, "a wealthy farmer," living two miles from Hillsdale, Michigan, doesn't take and can't read the RURAL. He got buncoed out of $2,000 the other day at three card monte by a brace of sharpers "who wanted to buy his farm"!!!..... .....
A Philadelphia Land Association with $1,000,000 capital, embracing many of the Quaker City's "best people" has invested heavily in property about Dallas, Texas... .....Ex-Secretary of War Bristow is at Saratoga, so the common opinion that he died years ago, must probably be incorrect .... ..Sunday night last, at Sweetwater, Wy. Postmaster James Averill and Cattle Queen, Kate Maxwell, were strung up to the same branch of a big cotton-wood with the two ends of the same rope by a lot of cowboys in the employment of the neighboring cattlemen who had for years been heavy losers from the depredations of the pair. Both were adepts in changing brands on cattle and mavericking—putting their own brands on young stock not yet properly branded. Fifty-eight freshly branded yearlings were found on their place Saturday, and stock detectives were driven off while investigating the matter. At the last the "Rustler" turned out a whining whelp and the "Range Queen," a blasphemous virago..... ... ...
There's a good deal of grumbling yet in the Conemaugh Valley. The distribution of the $500,000 in cash among the flood sufferers, begun a week ago, isn't finished yet. A large share of the contributions made by the public still remains in the hands of the collectors. Boston's gift of $187,364 hasn't been touched yet, though the holders have all along been ready to send on the whole or any part of it. Instead of putting the people sturdily on their feet again, the way the charity has been distributed in driblets threatens to make them a pack of cheats and beggars. Already there are loud complaints of fraudulent claims for help. It's very evident the relief commissioners are incompetent—they are small pegs in large holes..... .....
In Mississippi two persons were murdered and three lynched during the past week. Not a proclamation from Governor Lowry!..... Squat, thick-set, red-faced and small-eyed Mrs Mary Brady, of Jersey City, with a body weighing 250 pounds, and a tongue long enough to be a "holy terror" to her neighbors, was fined $25 with $50 costs, as a "common scold" the other day, the ducking stool having been abolished much to the regret of her neighbors.....
Kickapoo Indians refuse even to treat for the sale of their lands in Kansas..... Lewis Bros. & Co., the largest dry-goods commission house in Philadelphia, with large branch stores in New York and Chicago, has failed for $4,500,000. The concern hopes to pay its debts in full.....Charlemagne Tower, the Philadelphia multimillionaire, left behind him every cent of his $25,000,000 when he died at the age of 81 last Thursday. Did he ever do anything remarkable? Why, yes, of course—he made $25,000,000 .....
Catholic Bishop Walsh, of London, Ont., Can., has been elected Archbishop of Toronto, to succeed Archbishop Lynch who died May 12, 1888.....An English syndicate has purchased four breweries at Paterson N. J., for $2,000,000, and a small portion of the new stock. Two large breweries at Newark, N, J., were bought by another British syndicate for $2,350,000. In both cases the present owners are to continue managing the business for three years.....James B. Garfield, second son of President Garfield, is engaged to marry Miss Helen Newall of Chicago, daughter of John C. Newall, general manager of the Lake Shore Railroad.....

LATEST.—The *canard* about Mrs. Heron's danger in Corea is officialy contradicted, per cable, by Minister Dinsmore residing there... ....A number of the most prominent stockmen on the Sweetwater in Wy., have been arrested for lynching Jim Averill and Kate Maxwell, the great cattle thieves of that section..... Reports say that there has been a world of stealing wrecked goods in the Conemaugh Valley. Many of the houses along the lower river are said to be full of stolen goods.....

Beacons Along the Wayside.

When one who is bewildered discovers a beacon ahead, difficulties seem to vanish and if we except intervening roots and brambles, the haven is soon attained.

So much for what will presently be our simile.

When one, who is ill sees the good results of a means of cure, in cases far more desperate than his own, convalescence seems possible were it not for doubts and fears. Nevertheless Compound Oxygen is still a refuge for the sufferer. Here are a few encouraging beacons along the wayside:

ATLANTA, GA., March 22, 1888.
"I still recommend your remedy. It saved my wife's life and cured my boy of catarrh."
WALTER T. FORBES.

COLUMBIA, S. C., March 13, 1888.
"I have reason to believe that I have been benefited by this treatment, and commend it to those whose nervous systems need to be invigorated." DR. JOHN L. GIRARDEAN.

WILLISTON, S. C., March 20, 1888.
"I am pleased to report a continued improvement both in myself and wife. May you live long to bless suffering humanity with your Compound Oxygen Treatment.
REV. W. W. GRAHAM.

GASTONIA, GASTON CO., N. C., May 25, 1888.
"I speak to you the real sentiment of my heart when I state that I sincerely believe that had it not been for the Compound Oxygen Treatment, I would have been in my grave before this time." W. D. HANNA.

We publish a brochure of 200 pages, regarding the effects of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, July 27, 1889.

ALL the evidence on both sides being in, the Parnell Commission has adjourned for three months to give the Crown-Times lawyers an opportunity to prepare their speeches and the public—a rest. There will be no speeches on the side of the Parnellites, though there may be one.....The Parnellites are supporting Gladstone in favor of the "Royal Grants"—the incomes the Queen wants for the eldest son and daughter of the Prince of Wales soon to be married. The new Duke of Fife is willing to settle on the Princess Louise a sum equal to whatever Parliament would give, but his is-to-be mother-in-law insists on payment out of the public purse. When, nearly 100 years ago, the Crown surrendered to the nation the lands it owned and which made it independent, it was agreed that, in return, the royal family should be amply provided for by the country. The family now costs the nation $4,200,000 a year; but the annual cost from the first has been much smaller than that in any previous reign since the settlement. The Queen has been economical and saved a great deal, however, and people think she ought to settle sometning handsome on her grandchildren; then the family is tremendously prolific and threatens heavy drafts in future on the public Treasury, and a republican spirit is abroad among the masses. The Radicals in Parliament, under Labouchere, have split on this question in a friendly way from the other Liberals under Gladstone and their staunch old allies the Parnellites, and insist that the sums given to the Royal family are already too large and that further supplies should be provided by retrenchment of the expenses of the Royal household. Of course, the proposed largesses will be secured, but the vigorous opposition will make Ministers cautious in asking future bounties of the kind. Those who want the luxury of Royalty should'nt haggle about paying liberally for it. George B. Loring, ex-Commissioner of Agriculture, now United States Minister to Portugal, presented his credentials to the King Wednesday.....Thursday July 25, was Mrs. Gladstone's Golden Wedding Day. In 1839, when 30 years old, and six years in Parliament, and already marked out as a future Prime Minister by long-head politicians, he married "the handsome Miss Catherine Glynne," eldest daughter of Sir Stephen R. Glynne, of Hawarden, Flintshire, the present country home of the family. For 50 years she has been an ideal wife and mother, and he—well everybody knows what the "Grand Old Man" has been.....
There's a rumor that Mrs. Hattie Gibon Heron, wife of Rev. David Heron, lately of Jonesboro, Tenn., is under sentence of death in Corea, for preaching Christianity. Most of those best acquainted with Corea, say it's a cock-and-bull story, as the King of Corea isn't the kind of a man to permit such a thing..... ....A recent fire in Lu Chow, China, burned 23 hours, destroyed 8,000 buildings, cremated 1,200 people and caused 400 other deaths by toppling walls; 170,000 homeless people were forced to camp out without shelter, and, at last accounts, they were dying at the rate of 100 a day from hunger and exposure. For a monstrous calamity by fire or flood, look to China..... .....
M. Pasteur's system of inoculation against hydrophobia has been subjected to much hostile criticism. It has been ridiculed as a farce and denounced as an atrocity. Lately a reaction has set in, especially in England, where the Prince of Wales has taken a decided stand in favor of the French scientist. Since the beginning of Pasteur's operations in 1885, he has treated 6,950 patients, of whom only 71 have died. Of the total 1,187 were bitten by animals suspected but not proved to be mad. Of these only 12, or 1.01 per cent., died. Of the remainder 4,680 were bitten by dogs declared to be mad by competent veterinarians. Of these only 44, or 0.94 per cent., died. The remaining 1,077 were bitten by dogs which were proved to be mad by inoculating others from their bodies. According to conservative estimates, without Pasteurism, at least 157 or 15 per cent. of these would have died; but after treatment by Pasteur only 15, or 1.39 per cent. died. Many of the patients in all three classes did not come under Pasteur's care till a fortnight or more after they were bitten. Excluding these, the death rate in the first class would be reduced to five or 0.42; in the second class to 81 or 0.66 per cent., and in the other class to 11 or 1.2 per cent. Most of the patients were bitten through their clothes, so that the virus might have been wholly or partly wiped from the teeth before they entered the flesh: 540, however, were bitten directly on the face or neck. Without Pasteurism from 60 to 80 per cent. or from 326 to 432 would have died. Under the Pasteur treatment only 21, or 3.89 per cent. died. Pasteurism is likely henceforth to be recognized as an established public blessing..... .....
After all, from the standpoint of German militarism, there's considerable excuse for Bismarck's covert and open opposition to emigration from the Fatherland. Since 1871, the country has lost 1,769,297 of the most enterprising people in that way. Of these 1,618,816 came to the United States; 4,780 went to Canada, many of whom afterwards crossed over to this country; 33,443 went to Brazil; 15,599 to other parts of South America; 16,341 to Australia; 4,047 to Africa and 1,086 to Asia. At least one-third as many emigrated to other European countries, chiefly Great Britain, France and Russia; but in spite of all, the population of the Fatherland is steadily increasing at a pretty swift pace..... Down in Hayti, it was Hippolyte's turn to get whipped the other day, so his attacks on Port-au-Prince were repulsed "several times with severe loss." His besieged rival Legitime, is putting night-colored, thick-lipped Amazons on the breastworks. In this bloody burlesque of war the soldiers' pay is seven cents a day, and they seldom get it. Out of it, however, they have to furnish their own rations. Small wonder they can spare little time routing the foe, when they have to spend so much rustling for food.....

Anyone having a second crop of hay to cut, especially clover, should have Symmes' Hay and Grain Caps. Manufactured at Concord, N. H., by the Symmes' Hay Cap Co. Price, $37.50 per 100.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, July 27, 1889

AUGUST 2 is Grange Day at Chautauqua, when Hon. J. H. Brigham, Master, and Hon. Mortimer Whitehead, Lecturer of the National Grange, will address the meeting..... August 13–16 are Grange Days at the Keuka Assembly. Addresses are promised from Lieut. Gov. Jones, Gov. Luce, of Michigan, Hon. V. E. Piollet, of Pennsylvania, Dr. Collier, Miss S. A. Little, and many others... ... ..The Eastman's Company, of New York, has been incorporated, with a capital of $750,000, to carry on the business of slaughtering sheep and cattle for the market and for shipment abroad.....A Frenchman claims to have invented a process for preserving meat, so that it can be kept wholesome, and retain its taste, flavor, and nutritive qualities under all conditions. He says that 20 workmen can preserve the carcasses of 1,000 oxen in 24 hours, at a cost of 600 francs.....

A steamer loaded with bananas, bound from Jamaica to Boston, was burned at sea July 15 .....Policemen on the Brooklyn Bridge say that when the wind is right the Colorado beetles are blown on the bridge in clouds from the potato fields of Long Island.....There is a possibility of increased receipts of foreign beans ....The American Live Stock Commission Company is an association of Western cattle men who would not submit to the demands of the commission men for a fee of 50 cents a head for all stock sold. They have leased 400 cars from the Alton company, which are scattered from Texas to Montana, and every one of them which comes to Chicago is loaded with stock.....Reports from Carver, Mass.,are to the effect that thousands of barrels of cranberries were destroyed by the storm last week, the berries being cut from the vines by hail..... This year's yield of peanuts promises to exceed last year's.....The peach crop in Hunterdon and Warren Counties, N. J., is reported as promising not over half a crop. The quality is said to be superior, so the growers may perhaps realize as much as common..... .....Robert Elmer, an aged man, was badly gored by a bull at Asbury Park, N. J., recently..... .. Secretary Edge of the Pennsylvania State Board of Agriculture, has sent out a circular to the farmers in the State notifying them that applications for institutes should be made before October 1, as the appropriation may become exhausted..... A century ago, only 300 species of orchids were known; now authorities place the number of known species at 10,000.....1889 is the centenary of the introduction of the dahlia into England, and there will be a special exhibition of the flower by the National Dahlia Society at the London Crystal Palace, September 6—7.....The Buffalo fly has made its apperance in Pennsylvania..... Dogs killed two valuable colts for a Pennsylvania farmer living in Northampton County, recently..... ..... Prof. Lintner has discovered a very minute parasite which is preying upon the clover midge, and promises to destroy it..... Col. J. A. Price, of the Decorator and Furnisher, offers three prizes of $50, $30 and $20, for designs formed from the plant and grain of maize..... It is said that black-cap raspberries are not popular on the Pacific coast. The reason assigned is that they are too insignificant to become popular, and meet with little sale..... ... A team of valuable horses belonging to a New Hampshire farmer, were recently poisoned with Paris green which some fiend placed in their feed for revenge..... The United States honey exhibit at the Paris Exposition is quite extensive, and represents nearly all the leading makers. It occupies a floor space of 30 by four feet, besides various articles exhibited on the walls. A. I. Root, of Medina, Ohio, shows several styles of hives manufactured by him, as well as several other machines for apiarists. Dadant & Sons show some foundation so thin and clear that their name can be read distinctly through it. The show of honey itself is not good owing to much of it being broken in transit..... ....The Strawsonizer, to which frequent reference has been made in these columns, is said to attract more attention at the Paris Exposition than any other single implement. Several of these machines are at work in England and France, and it will probably be introduced in this country during the coming year..... .....

FIVE HARVEST EXCURSIONS.

The Burlington Route, C., B. & Q. R. R., will sell, on Tuesday, August 6th and 20th, September 10th and 24th, and October 8th, Harvest Excursion Tickets at *Half Rates* to points in the Farming Regions of the West, Southwest and Northwest. Limit 30 days. For circular giving details concerning Tickets, rates, time of trains, etc., and for descriptive land folder, call on your ticket agent, or address P. S. Eustis, Gen'l Pass. and Ticket Agent, Chicago, Ill.—*Adv.*

Crops & Markets.

SATURDAY, July 27, 1889.

Very conflicting reports in regard to crops come from all parts of the country, especially from the Northwest, in the spring wheat region. A reliable authority tells us one day that the Manitoba crop is almost a failure, and the next week an authority equally reliable says an average crop is assured. The completion of the harvest alone can determine. Taking the whole country together, as nearly as can be ascertained there will probably be nearly average crops of every grain but corn. The market is dull, and but little is doing, and this condition is likely to remain until the new crop begins to move freely. The price of beans is a trifle lower, but the stock on hand is not heavy, and prices will be well maintained for some time.

Potatoes sell well, and the demand fully equals the supply. Complaints of potatoes rotting reach us from various localities. Cabbage is very plentiful and prices are more satisfactory to the buyer than to the grower. Cucumbers are very plentiful and the price is low. Good egg-plant and tomatoes are in good demand. Onions plenty. Corn higher. Squash, turnips and other vegetables, in good supply.

Sales of several car-loads of California fruit, in addition to the other sources of supply, have kept the market well stocked. There is a disposition to force sales of peaches in anticipation of the incoming supplies. The best qualities of peaches, pears, apples and plums sell at good prices, but poor stock is slow of sale. Berries are about out of market, except huckleberries and blackberries which are plentiful yet. Concord Grapes from the South are in market. Muskmelons and watermelons are plentiful but good ones bring fair prices. The egg market is unsettled, but prices will soon be higher.

The receipts of cattle at Chicago have been very heavy, and prices have declined in consequence. The Northwestern ranges have begun to ship, and prices for this stock have ranged from $2.95 for cows to $3.65 for steers. Large numbers are also arriving from the Texas ranges. Really good beeves maintained nearly former prices, those suited to the shipping trade selling for $3.30 to $4.25, the bulk selling for $3.50 to $4. Stockers and feeders had a limited demand at $2 to $3, while cows and bulls went at $1.50 to $3. Veals sold at $2.50 to $4.50 per 100 pounds. Texas cattle and medium-weight natives are $1, to $1.25, and choice beeves $2 per 100 pounds lower than at the same time last year. The decline on big bullocks is at least $25 per head. Sheep have nearly maintained former prices, but unusually heavy receipts caused a decline of 25 cents. Prices range from $2.75 to $4.75 for sheep, and $4 to $5.75 for lambs. The stock comes mostly from Texas and the far West.

Hogs are selling for about $1.50 per 100 pounds less than they were one year ago, on account of large supplies. The number packed per week in the West is about 65,000 in excess of last year. The excess over last year since March 1, is about 820,000. The hogs arriving average larger and fatter than usual, so that the increase in the packed product is still greater. Choice light weights are scarce, and sell for extra prices, bringing $4.45 to $4.70, while heavy weights bring $4.00 to 4.45.

The Buffalo market was steady, and prices were well maintained. Good steers sold for $3.80 to $4.25; cows and heifers sold at $2 25 to $3.25. Michigan and Canadian stockers and feeders at $2.25 to $3; fat bulls at $2 50 to $3; stock bulls at $2 to $2.25 and veals at $3.50 to $4.25.

Sheep ruled lower in price because of inferior quality. Prices ranged from $4 to $4.75, while lambs sold at $5.50 to $6.50.

Hogs showed a slight upward tendency, under a good demand, and prices ranged from $3.25 for stags up to $4.90 for pigs.

At Pittsburg the supply of cattle was larger than usual, mainly from Chicago and the West, and prices declined somewhat. The supply of nice butcher cattle was not equal to the demand, and prices were maintained, ranging from $3.25 for light, to $4.15 for heavy. Stockers sold for $2 50 to $3.25; bulls $2 to $3. and dry cows $1.50 to $2.50.

Sheep are lower under an increased supply, ranging from $3. to $4.75. Spring lambs $3 50 to $5. Hogs sell at $4.25 to $4.80.
